

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE

The present YEAR BOOK for 1911 is the fifth volume that has appeared since the series was resumed with the publication of the NEW INTERNATIONAL YEAR BOOK for 1907. No essential change has been made in its plan or scope. Like its predecessors in the series, the NEW INTERNATIONAL YEAR BOOK for 1911 differs from all other annual volumes at present published in the English language in being encyclopædic in range and method and not confined to special fields or to a single country. Its purpose is to comprise in one annual volume all classes of information that are now scattered in many volumes, some exclusively statistical, others exclusively historical, biographical, political, or restricted to the United States or to the British Empire; and also to comprise certain features not to be found in other annuals, as, for example, an ample treatment of political events and political discussion here and abroad. In short, the aim has been, through the coöperation of some forty contributors with upwards of 800 pages at their disposal, to produce what may be fairly termed an encyclopædia of the year. As in preceding volumes, the text is written anew, instead of carrying forward from one year to another matter of a permanent sort, descriptive or statistical, which may be readily found in works of reference previously published.

In the United States the work of Congress under the new Democratic majority in the House of Representatives was of unusual interest, not only for the important measures passed, but for the equally important measures that failed to pass. Among the latter were the Reciprocity bill and the bill providing for direct election of senators. The discussion of the Reciprocity measure will be found in the article *TARIFF*, in the section on *Congress* under the UNITED STATES, and in the article *CANADA*. The State elections held in November, 1911, were of especial interest as indicating the possibilities of the Presidential campaign of 1912. Their results in MASSACHUSETTS, NEW JERSEY, NEW MEXICO, NEW YORK, and other States in which they were held are given under the respective State titles and in the paragraph on *Elections of 1911* in the article UNITED STATES. Among the interesting political events in the history of the municipalities during the year were the remarkable election in Los Angeles, the successful employment of the recall in Seattle, and the success of the reform movement in Philadelphia, which are described in the articles on CALIFORNIA, WASHINGTON, and PENNSYLVANIA, respectively. Under CALIFORNIA also will be found the record of the arrest and conviction of the McNamara brothers, which is also discussed in relation to trade unions in the article *TRADE UNIONS*. The results of the Thirteenth Census so far as made public at the close of the year will be found under UNITED STATES CENSUS, and in the articles on the different States and those dealing with agriculture and manufactures. The important trust decisions under the Sherman law and the discussion to which they gave rise are summarized in the articles on *TRUSTS*, *AMERICAN TOBACCO COMPANY*, and *STANDARD OIL COMPANY*. The article *BANKS AND BANKING*, in addition to the statistical record of the year, includes an account of the important Aldrich plan of reorganization and the arguments for and against it. Other significant developments in social and industrial matters are recorded in the articles *ARBITRATION AND CONCILIATION*, *CHILD LABOR*, *WORKINGMEN'S INSURANCE*, *STRIKES*, *PRICES*, *WOMEN IN INDUSTRY*, *FINANCIAL REVIEW*, *VAGRANCY*, etc.

In the record of foreign politics the outstanding features are the Moroccan difficulty which, for a time, threatened war, and resulted in the negotiation of the Moroccan treaties between France and Germany; the constitutional struggle in Great Britain and the passage of the Parliament act which curtailed the veto power of the House of Lords; the revolution in China which brought that country, at the close of the year, within sight of a republican government; and the TURCO-ITALIAN WAR, which was still indecisive at the close of the year. Among other significant features of the foreign record are the accounts of the difficulties and final failure of Mr. W. Morgan Shuster in his attempts to reorganize the finances of Persia; of the passage of the National Insurance bill in Great Britain, which is discussed under GREAT BRITAIN and in the article *WORKINGMEN'S INSURANCE*; of the negotiations over the Bagdad Railway, which will be found in the articles on FRANCE and GERMANY; of the troubled year in SPAIN, where labor outbreaks approached the dimensions of a revolution; and of PORTUGAL under her new republican government.

Great progress was made on the Panama Canal, the excavation, dredging, and masonry construction being on an unprecedented scale. Among other engineering projects may be mentioned those for supplying water to cities on the Atlantic and Pacific coasts respectively, including the Catskill aqueduct and the aqueduct for the city of Los Angeles. In contrast to the important engineering achievements were several serious failures, notably of large dams, one of which, at Austin, Pa., involved great loss of life. Owing to important developments during the year, it has been necessary to treat with especially fullness the following subjects among others: *AERONAUTICS*; *AQUEDUCTS*; *DAMS*; *RAILWAYS*; *FIRE PROTECTION*; *INTERNAL-COMBUSTION ENGINES*; *IRRIGATION*; *IRON AND STEEL*; *MILITARY PROGRESS*; *NAVAL*

PROGRESS; MUNICIPAL GOVERNMENT [(in connection with which a full list of the commission-governed cities is given); EDUCATION; UNIVERSITIES AND COLLEGES; AGRICULTURE; DRAINAGE; ANTHROPOLOGY; ARCHÆOLOGY; ELECTORAL REFORM; EXPLORATION; POLAR RESEARCH; MEDICINE, etc.

As heretofore, the material for the statistical articles is derived from official sources and in the preparation of these articles as well as those which deal with public affairs in the United States and in foreign countries, invaluable aid has been given by government officials. Among those to whom special recognition is due may be mentioned the following: Col. Frank McIntyre, Assistant Chief of the Bureau of Insular Affairs, for information in regard to the Philippines; Mr. O. P. Austin, Chief of the Bureau of Statistics, Department of Commerce and Labor; Mr. E. Dana Durand, Director of the Census; various officials in the Departments of War, Navy, and the Interior; the Superintendents of Education, Commissioners of Charities and Corrections, treasurers, the officers of colleges, societies, and religious bodies; and the editors of leading newspapers in the States, who have coöperated in the preparation of the paragraphs on State politics and history.

FRANK MOORE COLBY.

EDITOR

FRANK MOORE COLBY, M. A.

ASSOCIATE EDITOR

ALLEN LEON CHURCHILL

LIST OF CONTRIBUTORS

AGRICULTURE, HORTICULTURE, CHEMISTRY, INDUSTRIAL, AND EXPOSITIONS, FOODS, IRRIGATION, BOTANY, FORESTRY, ETC.

ALFRED CHARLES TRUE, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND

EDWIN WEST ALLEN, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
ASSISTED BY EXPERTS IN THE DEPARTMENT OF
AGRICULTURE AT WASHINGTON.

MARCUS BENJAMIN, PH. D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

ANTHROPOLOGY AND ETHNOLOGY

CLARK WISSLER, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY, AND

ROBERT H. LOWIE, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

DRAMA, PAINTING, AND SCULPTURE

PHILIP G. HUBERT, JR.,
FORMERLY ART WRITER FOR THE NEW YORK
"EVENING POST," AND FORMERLY OF THE DRAMATIC
DEPARTMENT OF THE NEW YORK
"HERALD."

ARCHITECTURE

A. D. F. HAMLIN, M. A.,
PROFESSOR OF THE HISTORY OF ARCHITECTURE,
AND EXECUTIVE HEAD, SCHOOL OF ARCHITECTURE,
COLUMBIA UNIVERSITY.

ECONOMICS AND POLITICAL SCIENCE

FRANK HAMILTON HANKINS, PH. D.,
ASSISTANT PROFESSOR OF ECONOMICS AND SOCIOLOGY,
CLARK COLLEGE.

EDUCATION

MILO B. HILLEGAS, PH. B.,
ASSOCIATE PROFESSOR OF ELEMENTARY EDUCATION,
TEACHERS COLLEGE, COLUMBIA UNIVERSITY.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH. D.,
PROFESSOR OF ART IN VASSAR COLLEGE

ELECTRICAL ENGINEERING

WILLIAM E. WICKENDEN, B. S.,
ASSISTANT PROFESSOR OF ELECTRICAL ENGINEERING,
MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

ASTRONOMY AND METEOROLOGY

T. W. EDMONDSON, PH. D.,
PROFESSOR OF MATHEMATICS, NEW YORK UNIVERSITY.

EXPLORATION AND POLAR RESEARCH

CYRUS C. ADAMS,
MEMBER OF THE STAFF OF THE AMERICAN GEOGRAPHICAL SOCIETY. GEOGRAPHICAL WRITER
FOR THE NEW YORK "SUN."

CHEMISTRY

JAMES LEWIS HOWE, PH. D.,
PROFESSOR OF CHEMISTRY AT WASHINGTON AND
LEE UNIVERSITY.

FOREIGN GAZETTEER

EDWARD LATHROP ENGLE AND
ALLAN EVA ENGLE.

GEOLOGY

DAVID HALE NEWLAND,
ASSISTANT STATE GEOLOGIST, NEW YORK.

INTERNATIONAL ARBITRATION

CLINTON ROGERS WOODRUFF, LL. B.,
SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND OF THE MOHONK CONFERENCE, AND
PRESIDENT OF THE BOARD OF PERSONAL REGIS-
TRATION, PHILADELPHIA.

LIBRARY PROGRESS

M. R. HAINES,
MANAGING EDITOR OF THE "LIBRARY JOURNAL"

LITERATURE, AMERICAN AND ENGLISH

EDWIN E. SLOSSON, PH. D.,
LITERARY EDITOR, "THE INDEPENDENT."

LITERATURE, FRENCH

ALBERT SCHINZ, PH. D.,
PROFESSOR OF FRENCH LITERATURE, BRYN MAWR
COLLEGE.

LITERATURE, GERMAN

AMELIA VON ENDE,
AMERICAN CORRESPONDENT FOR THE "LITERAR-
ISCHES ECHO."

MANUFACTURES, TECHNOLOGY, AERO- NAUTICS, AND FIRE PROTECTION

HERBERT TREADWELL WADE.

MEDICINE

ALBERT WARREN FERRIS, A. M., M. D.,
PRESIDENT NEW YORK STATE COMMISSION IN
LUNACY UNTIL JANUARY 1, 1912; FORMER AS-
SISTANT IN NEUROLOGY, COLUMBIA UNIVERSITY;
FORMER ASSISTANT IN MEDICINE, NEW YORK
UNIVERSITY AND BELLEVUE MEDICAL COLLEGE;
ASSISTED BY

DAVID G. YATES, M. D.,
SURGEON, NEW YORK CHILDREN'S HOSPITAL AND
DEMILT DISPENSARY.

MILITARY PROGRESS

O. E. HUNT, CAPTAIN, U. S. A.,
INSTRUCTOR IN MODERN LANGUAGES, UNITED
STATES MILITARY ACADEMY.

MILITARY STATISTICS, FOREIGN

HERBERT TREADWELL WADE.

MUSIC

ALFRED REMY, M. A.,
PROFESSOR OF HARMONY AND COUNTERPOINT,
INTERNATIONAL CONSERVATORY, NEW YORK.

NAVAL PROGRESS AND BATTLESHIPS

H. F. BRYAN, COMMANDER, U. S. N.

PHILOLOGY

CHARLES KNAPP, PH. D.,
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD
COLLEGE, COLUMBIA UNIVERSITY.

LOUIS H. GRAY, PH. D.,
ASSOCIATE EDITOR OF THE "ORIENTALISCHE
BIBLIOGRAPHIE."

PHILOSOPHY

FRANK THILLY, A. M., PH. D., LL. D.
PROFESSOR OF PHILOSOPHY, SAGE SCHOOL OF
PHILOSOPHY, CORNELL UNIVERSITY.

PHYSICS

BURTON W. KENDALL, S. B.,
INSTRUCTOR OF PHYSICS, COLUMBIA UNIVERSITY.

PSYCHOLOGY, PSYCHICAL RESEARCH, AND PSYCHOTHERAPY

MADISON BENTLEY, B. S., PH. D.,
ASSISTANT PROFESSOR OF PSYCHOLOGY IN COR-
NELL UNIVERSITY.

RAILWAYS

RODNEY HITT, B. S., M. E.,
ASSOCIATE EDITOR "STREET RAILWAY JOURNAL."
ASSOCIATE MEMBER MASTER CAR BUILDERS'
ASSOCIATION.

SANITARY ENGINEERING AND MU- NICIPAL ACTIVITIES

MOSES NELSON BAKER, C. E.,
EDITOR OF THE "ENGINEERING NEWS."

SPORTS

CHARLES A. TAYLOR,
MEMBER OF THE STAFF OF THE NEW YORK
"TRIBUNE."

UNIVERSITIES AND COLLEGES

EDWIN E. SLOSSON, PH. D.,
LITERARY EDITOR, "THE INDEPENDENT."

ZOOLOGY

AARON L. TREADWELL, PH. D.,
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*=Latin "which see") in parentheses following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

THE NEW INTERNATIONAL YEAR BOOK

ABBAY, EDWIN AUSTIN. An American artist, died August 1, 1911. He was born in Philadelphia in 1852 and received his early education in Philadelphia and first studied art at the Pennsylvania Academy of the Fine Arts. His artistic endeavors began when he was a small child and it is related that before he was four years of age he used to amuse himself by scribbling figures of men and beasts on the margins of old magazines. His first published picture appeared in *Oliver Optic's* magazine for young people, *Our Boys and Girls*, in 1866. This was an illustrated rebus. Two years later he took instruction in wood engraving. His wood engraving entitled "The First Thanksgiving," was accepted by *Harper's Magazine* before the artist was twenty years old. At the Pennsylvania Academy of the Fine Arts he acquitted himself with signal honor in black-and-white work. Shortly after his graduation he became one of the permanent staff of *Harper's Magazine*, which at that time included Charles S. Reinhart, Howard Pyle, Joseph Pennell, and William T. Smedley. He became a member of the famous "Tile Club." It was the duty of the members of this club to paint tiles and plaques for the adornment of each other's studios. Abbey spent a great deal of time in fulfilling this duty. He was, however, primarily at this period a worker with the pencil. He received the commission from the magazine to illustrate some of the poems of Robert Herrick, and in order to absorb the proper atmosphere for this work he went to England. He lived and wandered about in the portions of the country identified with Shakespeare. After he had illustrated Herrick's *Hesperides* and *Noble Numbers*, he turned his attention to a noteworthy series of Shakespearean drawings. The completion of this task found him with a reputation in both America and England. It was his intention to return to America on the completion of this commission, but English influences proved too strong and he remained in England for the greater part of the remainder of his life. Abbey's transition from pencil to painting was gradual. He had always worked more or less with water colors, and his water-color work had attracted attention in London. In 1883 he was elected a member of the Royal Institute of Water Colors. His first honors with oils came in 1890 when the Royal Academy not only accepted his "May Day Morning," but hung it in a favorable place. Six years later he was elected an associate in the Academy, and in 1908 was made a full academician. His most notable work was done as a decorative painter and perhaps the series by which he will be

longest remembered is "The Quest of the Holy Grail," in the Boston Public Library. His greatest fame in England was won by his painting of the coronation of Edward VII., which he was especially commissioned to do. Other notable pictures in addition to those mentioned above are: "The Trial of Queen Katherine," "Crusaders Sighting Jerusalem" (1901), "Columbus in the New World" (1906), reredos for the American church in Paris, 1907. At the time of his death he was occupied on a remarkable series for the Pennsylvania State Capitol at Harrisburg. A portion of this work had already been completed. Mr. Abbey was a member of many American and European societies connected with art. He was also a chevalier of the French Legion of Honor.

ABBEY, HENRY. An American poet, died June 7, 1911. He was born at Rondout, N. Y., in 1842, and was educated at Kingston Academy and the Hudson River Institute. He edited several papers in New York and contributed to the *New York Leader* and other papers. He was the author of several volumes of poems, including *My Dreams* (1862), *Ballads of Good Deeds* (1872), *The City of Success, and Other Poems* (1883). A complete edition of his works was published in 1904.

ABUSJR. See **ARCHÆOLOGY.**

ABYSSINIA. Formerly the Empire of Ethiopia. An empire (independent) of eastern Africa. The area is variously estimated at from 308,000 to 432,000 square miles; the population, between nine and eleven millions. The capital is Addis Abbeba, with an estimated population of between 30,000 and 35,000. The Abyssinians are members of the Alexandrian Church, the head bishop being a Copt; education (compulsory since 1907 for males) is provided by the state through Coptic teachers. The chief industries are stock raising and agriculture, carried on by primitive methods. Tropical fruits, rubber, and valuable timbers are plentiful. Iron, coal, gold, etc., have been found. Imports through Jibuti in 1908 were valued at about £285,000; through Zeila, the Sudan, and Italian colonies, at about £70,000 (cotton goods, £81,500; American gray shirting, £43,878). Exports by way of Jibuti, about £334,868; Zeila, etc., about £40,000 (coffee, £109,047; hides and skins, £87,304; ivory, £63,838; wax, £36,717). The railway from Jibuti (in French Somaliland) to Diré Dawa (193 miles, of which 111 are in Abyssinia) has been taken over by a new company, which plans to extend the line to Addis Abbeba. Telegraphs (1056 miles) and posts are under French management. The Menelek dollar (the talari, worth about 50 cents) is the

official standard; but barter prevails in many parts.

The regular army of Abyssinia at present consists of mercenary troops under weak central control, and inadequately organized. There are also various tribal troops from the different large provinces in each of which they act as garrison under the *ras*. The imperial troops are for the most part mounted and form an irregular cavalry and artillery, with 50 modern and 30 old type guns, in addition to some Hotchkiss guns for the mountain battalions. The imperial and tribal forces together are estimated at about 1000 men. In addition, there are foot soldiers with varying arms and equipment which in recent years have been improved to a considerable extent. In the event of war unembodied retainers, numbering perhaps 140,000, and somewhat in the nature of a militia, could be added to the regular forces and about 200,000 men put in the field, but only a part would be armed with modern rifles, and these would include many different patterns.

The emperor in 1911 was Menelek II. (born 1844, crowned 1889). His grandson, Lidj Jeassu (or Eyassu), has administered the government (under the guardianship of Ras Tassama) since March 23, 1910. He was born in 1897; proclaimed heir-apparent in 1908; was married (1909) to Princess Romanie, granddaughter of John, former emperor of "Ethiopia."

It was announced on May 18 that Lidj Jeassu, Emperor Menelek's grandson, had been solemnly proclaimed emperor, and that the brother of the empress Taitu, Ras Olie, had been condemned to death for treason. In July and September it was reported that fighting had taken place between the rival chiefs, and it was said that the father of Lidj Jeassu had driven his opponent, brother of the deposed empress, out of his position and seized his territory.

ACADEMY, BRITISH, FOR THE PROMOTION OF HISTORICAL, PHILOSOPHICAL, AND PHILOLOGICAL STUDIES. This body was incorporated by royal charter in 1902. It aims at the promotion of the study of moral and political science, including history, philosophy, law, politics and economics, archaeology and philology. The maximum number of ordinary fellows is fixed at 100. In 1911 there were ninety-nine distributed under four main sectional committees—history and archaeology, chairman, Dr. G. W. Prothero; philology, chairman, Dr. F. G. Kenyon; philosophy, Professor B. Bosanquet; jurisprudence and economics, chairman, Sir W. R. Anson. The president of the academy is Dr. Ward, master of Peterhouse College, and the secretary is Professor I. Gollancz.

ACADEMY, FRENCH (*Académie Française*). The French Academy is the first of the five academies constituting the Institute of France. It consists of forty members and is the final authority on questions relating to the niceties of the French language and of grammar, rhetoric, and poetry, and of the classification of French classics. Four new members were elected in 1911: Gen. Hippolyte Langlois to succeed Marquis Costa de Beauregard; Henri de Regnier to succeed Marie Eugène Melchior, Vicomte de Vogüé; Henry Roujon to succeed Louis Henri Barboux, and Denys Cochin to succeed Jules Albert, Comte Vandal. There was one vacancy in the academy at the end of the year.

ACCIDENTS, CAUSES OF. See EMPLOYERS' LIABILITY.

ACCIDENTS, PREVENTION OF. See LABOR LEGISLATION.

ACCIDENTS, RAILWAY. See RAILWAYS.

ADALIN. Known chemically as brom-diethyl-acetylcarbamide, has the formula $C_4H_{10}O_2N_2Br$. It is an almost colorless and odorless crystalline powder, with a melting point of $116^\circ C.$ ($240.8^\circ F.$), which dissolves readily in alcohol, but with difficulty in water. It is prepared by the action on urea of brom-diethyl-acetyl bromide, obtained by the action of bromine on diethylacetic acid anhydride. Adalin is said to be an efficient and prompt sedative, reducing mental excitement and producing sleep in conditions where a powerful hypnotic is not needed. In ordinary doses it does not depress the heart or respiration, and the sleep induced is restful and dreamless. The drug is recommended as a sedative and mild hypnotic in neurasthenia, hysteria, cardiac neuroses with rapid heart action, chorea, mental disorders with moderate excitement, and insomnia.

ADAMS ACT. See AGRICULTURAL EXPERIMENT STATIONS.

ADAMS, CHARLES FRANCIS. See LITERATURE, ENGLISH AND AMERICAN, *History*.

ADAMS, GEORGE B. An American jurist, died October 10, 1911. He was born in Philadelphia in 1845, and was educated in the public and private schools of that city. He served in the Civil War, and after its close remained in the quartermaster's department in the regular army until 1871. In 1876 he began the study of law and was admitted to the bar from Pennsylvania in 1878. In 1883 he removed to New York City where he specialized in admiralty cases. In 1901 he was appointed by President McKinley to be district judge for the Southern District of New York. He was reappointed by President Roosevelt. For two years before his death he was unable to fulfill his duties on the bench on account of illness.

ADAMS COUNTY. See OHIO.

ADEN. A British dependency on the coast of Arabia; a part of the Bombay Presidency. Area, 75 sq. miles; population 1901, 41,222; 1911, 46,165. Attached to Aden are the island of Perim (area, 5 sq. miles; population in 1901, 2752), the Kuria Muria Islands (five in number), and the Aden Protectorate (area, 9000 sq. miles; population about 100,000). Sokotra, an island off the coast of Africa, is under British protection (area, 1382 sq. miles; population, about 12,000, chiefly Mohammedans). Imports (1909-10) by sea, £2,956,055; by land, £163,693; treasure, £524,706. Exports by sea, £2,621,780; by land, £102,594; treasure, £545,341. Government stores and treasure are not included. The trade is almost exclusively one of transhipment. In 1909-10 1323 merchant vessels of 3,187,479 tons (net) entered the port of Aden; 401 at Perim. A political resident (1911, Brig-Gen. J. A. Bell) administers the dependency under the Bombay government. Aden is an important coaling station, and by reason of its strategic position is strongly fortified.

ADLER, HERMANN. Chief rabbi of the United Congregations of the British Empire, died July 18, 1911. He was born in Hanover, Germany, in 1839. His father was chief rabbi of Hanover and was afterwards chief rabbi of Great Britain. He was educated at University College, London, and at Leipzig and Prague universities. In 1862 he was ordained and two years later was

appointed minister of the Bayswater Synagogue in London. Here his ministry was remarkably successful, and on the death of his father in 1889 Dr. Adler was unanimously chosen to succeed him. In addition to his chief rabbiship he was, in reality, minister of the Great Synagogue, which is the Cathedral Synagogue of London. Within the Jewish community his sphere of activity included almost every institution of any importance. He engaged in several famous controversies. One of the earliest works which he wrote was *The Jewish Reply to Dr. Colenso's Criticism on the Pentateuch*. Another famous controversy in which he took part was that with Professor Goldwin Smith on the subject, *Can Jews be Patriots?* Dr. Adler was elected an honorary member of the Athenaeum Club and was also an honorary D. C. L. of Oxford and an honorary LL. D. of St. Andrews. Among his published writings in addition to those mentioned above, are *A Volume of Sermons on the Old Testament*, several volumes of pulpit addresses, and many articles and addresses on education, social questions, Hebrew literature, and Anglo-Saxon history. He was a contributor to the *Jewish Encyclopedia*.

ADVANCEMENT OF SCIENCE. AMERICAN ASSOCIATION FOR THE. A learned society which is a continuation of the American Association of Geologists and Naturalists, organized in 1840. In its present form it was chartered in 1874. The association is made up of eleven sections: Mathematics and Astronomy; Physics; Chemistry; Mechanical Science and Engineering; Geology and Geography; Zoölogy; Botany; Anthropology and Psychology; Social and Economic Science; Physiology and Experimental Medicine, and Education. The association holds annual meetings in different cities of the United States. The meeting for 1911 was held in Washington, D. C., December 27-30. This was the most successful meeting in the history of the association both from point of attendance and from the enthusiasm shown. The total registration of members of the association was 1306. A large number of affiliated and other scientific societies met in Washington at the same time. The opening meeting of the association was called to order by the retiring president, Dr. A. A. Michelson, who introduced the president-elect, Dr. Charles E. Bessey of the University of Nebraska. An address of welcome was delivered by President Taft and to this President Bessey responded. The annual address delivered by the retiring president, Dr. Michelson, was entitled "Recent Progress in Spectroscopic Methods." Among other important addresses delivered in the various sections were those by Professor Frankforter before the Section of Chemistry on "Resins and Their Chemical Relations to the Terpenes"; Mr. Rotch before the Section of Mechanical Science and Engineering on "Aerial Engineering"; Professor Moore before the Section of Mathematics and Astronomy on the "Foundation of the Theory of Linear Integral Equations"; Professor Dixon before the Section of Anthropology and Psychology on the independence of the Culture of American Indians; and Senator Burton before the Section of Social and Economic Science on "The Cause of High Prices." Among

the symposiums held in connection with other societies were those on "Instinct and Intelligence," with the American Psychological Association and on "Soils," with the Botanical Society of America. The following officers were elected for the year 1912: President, Dr. Edward C. Pickering, director of the Harvard Astronomical Observatory; vice-presidents, Section A, Mathematics and Astronomy, A. E. B. Van Vleck, University of Wisconsin; Section B, Physics, Arthur Gordon Webster, Clark University; Section C, Chemistry, W. Lash Miller, Toronto; Section D, Mechanical Science and Engineering, J. A. Holmes, Washington, D. C.; Section E, Geology and Geography, James E. Todd, University of Kansas; Section F, Zoölogy, Professor William A. Lucy, Northwestern University; Section G, Botany, Professor D. S. Johnson, Johns Hopkins University; Section H, Anthropology and Psychology, Professor J. Walter Fewkes, Washington, D. C.; Section I, Social and Economic Science, John Hays Hammond, New York; Section K, Physiology and Experimental Medicine, J. J. McCleod, Cleveland, O.; Section L, Education, J. McKeen Cattell, Columbia University; general secretary, H. E. Summers, Iowa State College; secretary of the council, H. W. Springsteen, Western Reserve University. The next meeting of the association is to be held in Cleveland, O., in January, 1913.

ADVANCEMENT OF SCIENCE. BRITISH ASSOCIATION FOR THE. This society was founded in 1831 for the stimulation of scientific inquiry and the attraction of public attention to its progress. The association holds annual meetings in different cities of the United Kingdom. The meeting in 1911 was held at Portsmouth. The presidential address was delivered by Sir William Ramsay, who called attention to the deficiencies of scientific education in the United Kingdom. He laid special stress on the weakness of the scholarship and examination system. In the Mathematical and Physical Section, the president, Professor H. H. Turner, reviewed recent astronomical work, notably that of Professor Campbell at the Lick Observatory. A number of foreign papers were read, among them one on "The Earth as a Radiator" by Professor W. J. Humphreys of the United States Weather Bureau. Many important addresses were made in the meetings of the other sections of the association. The president is Sir J. J. Thomson. The next meeting of the association will be held at Dundee, Scotland.

ADVENTISTS, SEVENTH DAY. A religious denomination which had its origin in 1845. Its doctrine is based on the belief that the second coming of Christ is near at hand, founded on certain passages in both the Old and New Testaments. Since its foundation, the doctrines of the body as to the second coming of Christ have been modified. While the original founders set a specific date for the second coming, the belief now held by the denomination is that the event is near at hand, but no set time is specified. According to the United States Census of 1906, published in 1910, the body in the United States numbered 62,211 communicants, 488 ministers, and 981 churches. The property in its possession was valued at \$1,454,087. In the Sunday schools were 50,225 scholars with 11,033 teachers. Figures gathered by officers of the denomination indicated that there were at the close of 1911, 23 union conferences, 106 local conferences, 150 foreign mission stations (48 being

in non-Christian lands), and 2769 churches, with 104,526 communicants. The denomination spends annually over \$2,000,000 for the support of all lines of evangelical work. In educational lines it is represented by 86 colleges, academies, and intermediate schools, and 594 primary schools. There are 28 denominational publishing houses, printing 126 papers. The publications are issued in 67 languages. The denomination also maintains over 80 sanitariums, with which there are connected over 2000 physicians and trained employees. The next general conference of the denomination meets in 1913.

In addition to the Seventh Day Adventists several other bodies bear the name Adventists. These have practically nothing in common with the former denomination except possibly the doctrine of the second coming of Christ, and even there the connection is remote. These bodies are the Evangelical Adventists, numbering in 1911 481; Advent Christians, 26,799; Church of God, 611; Life and Advent Union, 509; Churches of God in Christ Jesus, 2124.

AERODROMES. See AERONAUTICS.

AERONAUTICS. Under this title it is the custom of the YEAR BOOK to include the navigation of the air by such dissimilar means as the aeroplane and other mechanical devices heavier than air, the dirigible balloon, and the aerostat or spherical non-dirigible. In all of these fields in 1911 and the years immediately preceding, there was notable accomplishment and progress, but most of all in aviation where improvements in the design of supporting planes and propelling motors had put mechanical flight on a practical basis.

AVIATION

The record of accomplishment in aviation in 1911 best can be understood when the events of the years immediately previous are summarized. After the first announcement of the Wright brothers' flight with a motor-driven aeroplane, December 19, 1903, it was almost two years, September 26, 1905, before a flight of eighteen minutes' duration was made by these American inventors. Then on July 6, 1908, Henry Farman in France with his biplane made a flight of twenty minutes' duration, and later made the first cross-country flight, flying on October 30 from Bouy to Rheims, a distance of seventeen miles. In the meantime Orville Wright on September 9 had made a flight of over one hour's duration, and other aviators were entering the field, so that by June, 1909, when the first great aviation meeting was held at Rheims there were numerous contestants. In this year, on July 25, Louis Blériot flew across the British Channel, and Henry Farman, November 3, made the then notable record of a flight of 144 miles in four hours and six minutes at Mourmelon. In 1910 many aviators achieved success, especially in flights from city to city, across the English Channel, across the Alps, and finally over a measured course 385 miles in 7 hours, 48 minutes, by M. Maurice Tabuteau were recorded. Such achievements were being secured by an ever-increasing number of aviators, whose ranks from time to time were diminished by fatal accidents.

From such beginnings and early flights the

use of the aeroplane, as well as the mechanical efficiency and construction of the machine itself, developed until by the beginning of 1911 the practice and theoretical knowledge of aviation had reached a point where the condition and problems of the air and its navigation were well recognized. The monoplane or aeroplane with a single supporting surface, whose possibilities hardly had been indicated in the earlier days, had been developed so that in speed and efficiency it had rivaled, if not surpassed, the older biplane so successfully used by the Wright brothers in the United States and France and more, or less imitated by French and American inventors. Flight with aeroplanes had been extended from mere exhibitions and demonstrations where conditions of wind and weather had to be considered, to long-distance flights extending even across the continent, and the development was compared quite properly with that of the automobile.

The early aim of the aeroplane designer was to secure a large supporting surface that with its engine should involve a minimum weight for the power secured. Consequently, earlier machines were made with a light framework of wood, the breaking of which led to many serious accidents. With increase in power of the gasoline engines, and with no substantial increase in its weight, it was found possible to reduce the area of the supporting planes and to make the machines themselves of greater strength, even at an increase in weight. This was particularly the case with the monoplane where high speed was secured, especially in the machines of Blériot, and led to a reduction in the size of the supporting surface.

At first these monoplanes were used for short distances and high-speed flights, at which they figured successfully in many competitions, but soon their possibilities were realized and by 1911 they were able to compete successfully not only in speed and distance competitions, but in such reliability and other tests as were demanded by European war offices.

At the beginning of the year 1911 a gradual development in all fields of aviation was looked for rather than extraordinary incidents, which characterized the earlier stages of the art. It had passed from sensational exhibitions for the curiosity of the multitude to the realm of accepted fact, and further developments were to come along lines of sound engineering and economic practice.

This, as will be shown, was in general the tendency of the year, which, taken all in all, was one of distinct progress. There was not an undue imitation of successful machines by the many manufacturers, but more or less development along original lines. This was evidenced by the fact that during the year it was estimated that some two hundred different types of aeroplanes were in use, of which a greater proportion than ever were practical. Naturally there was also an increased number of aviators, both amateurs and professionals, and the aggregate mileage was reaching large figures. In the United States alone some four hundred new aeroplanes were constructed and of these about three hundred were successful, which was a far greater proportion than in any previous year.

In all branches of aviation there was considerable development, and the machines produced were of greater efficiency than in previous years. A large number of exhibitions were held in all

the leading countries of the world and various competitions took place, for which valuable prizes were given. There were so many contestants, however, that the individual winnings and results were hardly as great as in previous years; and it was believed that this feature of practical aviation had reached its highest point. Vast outlays were made by manufacturers of machines in Europe, which already had begun to number long-established engineering firms, yet it was considered that the commercial possibilities would rest rather in the military use than in more general fields other than sport. Numerous sales were made to foreign governments, and military tests made for the French army led to important results from a commercial as well as military standpoint.

Owing to competitions and military applications the main aim in the design and construction of machines during the year was to increase speed, and this naturally required engines of greater horsepower, so that motors from 140 to 200 horsepower were being fitted to the more recent aeroplanes. With the increase of speed the dangers of flight were diminished, especially under unfavorable conditions of weather and changes of the wind. The most apparent shortcoming in the aeroplane of 1911 was the inability of the aviator to control his speed as desired, and especially to start his motor again in case of stoppage or sudden failure.

While the Curtiss and Wright biplanes were frequently seen in the United States in long-distance flights and competitions, where they gave good accounts of themselves, in the various European races and long-distance events the monoplane appeared to somewhat better advantage than the biplane, and the tendency of the year was to construct monoplanes stronger and of more compact form, with powerful engines. In other words, the monoplanes were being made so rigid as to need but the smallest possible number of stays for their frames and planes and thus reduce the amount of air resistance.

An interesting feature of the year was the construction of aeroplanes with bodies more closely resembling that of a bird, which became most marked in the Austrian Etrich monoplane. These covered bodies were first developed in the case of the monoplane, and the long covered fuselage was found much more useful to support the propeller and side planes than a construction of spars and at the same time it diminished resistance. Furthermore, such covering naturally involved the enclosing of the motor, and at the Paris Aviation Salon, held in December, it was noted that most of the more advanced types of machines were built with enclosed motors.

Another tendency of the year was to increase the strength of the various aeroplanes by the increased use of tubular steel of high tensile strength for the framework. At the Paris Salon of 1911, of forty-two machines exhibited, six were built entirely of steel, five of steel and wood, and one of steel and aluminum. The frames of the remainder were of wood. Sheet steel has been used in some cases for the planes, and several machines have been shown with bodies of pressed steel.

In the general design of the planes various conditions had to be taken into consideration. The ability to warp the wings being controlled by the Wright patents, some other means was

required by other makers. Yet the flexibility of the planes themselves was no longer desired if smaller controlling planes or ailerons could be used. These have been found very satisfactory, and they figure in most of the aeroplanes of the day. Some device for reducing the size of the planes or reefing them was also suggested, as by telescoping, but nothing practical along these lines was forthcoming.

Taken all in all, the great tendency of aeroplane design was the reduction of resistance and supporting surface, and using the power of the motor to compensate for it. With increased power and means of control at their disposal aviators during the year were able to fly under conditions of wind which previously would have been considered impossible. Flights in winds up to thirty miles an hour were not uncommon, and in the long-distance trips the amount of time lost by bad weather was being greatly diminished.

MOTORS. With the conditions of the planes and propeller virtually established, the question of the engine was perhaps the most important one to be considered by the aeroplane engineer. There was a demand for increased reliability and ability to operate the motor at different speeds, and start and stop it at will. In fact the Short biplane was provided with a double motor, so that power was available in the event of the failure of one engine. That this was a desired condition was shown by the fact that the *Scientific American* offered a prize of \$15,000, given by Edwin Gould, for the most perfect and practicable heavier-than-air flying machine designed and demonstrated in the United States, equipped with two or more complete power plants (separate motors and propellers) so connected that either may be operated separately or both used together.

The aviation motor, as a type of internal-combustion engine developed under special conditions, has been designed to secure the maximum power with the minimum weight. With this end the object has been to secure as many air-cooled cylinders as possible, so as to give out the greatest power for the weight involved. Yet many aeroplanes were fitted with four-cylinder water-cooled motors, a particularly efficient example being that used in the Bréguet biplane.

The problem in 1911 was to secure increased flexibility. The motor should be capable of an economical speed for ordinary conditions of flight, but furthermore it should be capable of instant acceleration when the aviator meets a strong current or air-hole which tends to alter his equilibrium. In addition, it should be possible to control the motor when gliding to earth for a landing without the danger of the machine being stopped by the propeller, acting as a brake. With some aviation engines it was impossible to reduce speed, while with others there was but a limited amount of flexibility. Furthermore, improvements in the method of lubricating and carburetting were needed, and all these considerations involved a gradual and careful improvement.

Many of the propeller shafts were directly connected to the countershaft of the engine, so that the velocity of the latter is restricted. For that reason renewed interest was being manifested in the chain drive as used by the Wright brothers on their biplane. This would permit a high-speed engine, with a large propeller turn-

ing more slowly and more efficiently, and reproduce to a large extent the conditions under which an automobile motor is operated, with the change of speeds through gears or otherwise.

At the end of 1911 it was an open question whether the aviation motor of the future would be further along original lines or there would develop additional modification of the automobile motor, which already had been taking place. Yet aviators had been prompt to introduce all improvements made in motor-car engines that are applicable, and several monoplanes were supplied with self-starting engines.

In the efforts to secure the improvement of the aeroplane motor in the interest of increased efficiency and general reliability, there has been an attempt to eliminate the torque caused by the varying eccentricity of the pistons in the rotary engine. To improve this condition M. Anzani suggested the insertion of two groups of cylinders, one behind the other, in order to balance the torque of one group by that of the other. The gyroscopic effect of the rotary engine has proved a source of trouble, and while it is desirable to use this effect to secure automatic stability, yet no satisfactory results were reached. Various independent gyroscopic devices have been suggested to increase the stability of the aeroplane, but none was considered practical.

All things considered, during the year there were no revolutionary changes in the motors employed with the leading types of aeroplanes. Of the thirty-one machines entered in the French military trials, twelve had Gnome motors and seven Renault. The Gnome motor achieved considerable vogue in Great Britain and the United States, yet in the latter country the Wright and Curtiss types continued pre-eminent. With many of the newer machines, silencers were being used, and it was thought that their application would be very general; in fact they were demanded in the British military specification issued at the end of the year. Already mufflers had been adopted by the Wright brothers for their motors and silence was considered no less desirable to the aviator than it was essential as a military necessity for scouting and reconnaissance.

Among the many machines developed during the year were various unusual types, a large proportion of which naturally failed of success. Two triplanes, namely, the Astra-Wright and the Paulhan, were seen in the French military competition flights, but did not achieve the success of the older types.

While the French have maintained preëminence in the construction of aeroplanes, a new German design attracted favorable notice during the year. This was the *Albatross*, a biplane in which are flexible extensions of the main planes at the rear in place of ailerons. These extensions are warped by wires much after the fashion of the familiar Wright biplane. This machine, of which twenty had been sold to the German government, and six to Russia, was considered by critics typical of the latest developments at the close of the year, inasmuch as it had a monoplane body which became flat at the rear and terminated in a horizontal rudder. Above the tail was located a vertical rudder in the shape of a fin, while the lower plane was very short. The two planes are connected by diagonal struts or braces in place of the more usual truss wires.

CARRYING CAPACITY. During the year the passenger-carrying capacity of the aeroplane was developed. On January 20 six passengers were carried by M. Sommer, and on March 24, in a machine of his own design, he was able to carry aloft twelve passengers with a total weight of 1436.5 pounds. August 29, with six passengers Sommer flew a distance of ninety-nine miles, and on October 16 he carried six passengers from Rheims to Mourmelon and back, a distance of thirty miles. M. Bréguet on March 23 had carried eleven passengers for three kilometers in a flight at Douai. So much progress has been made along these lines that Blériot built for Henri Deutsch de la Meurthe a passenger-carrying machine that was termed an "Aerial Taxi-cab." This machine had a finished body, like that of a taxicab, and the four passengers entered by a side door, sitting behind the pilot who was placed in front with a foot tiller and other contrivances at his command. A 100-horsepower Gnome motor was mounted on top of the cab, together with the fuel tanks and the spread of wing was forty-three feet from tip to tip, while the over-all length was forty-six feet. This machine ready for flight without passengers weighed 1540 pounds. There were pneumatic cushions to protect the passengers in case of rough landings, and mica windows through which the landscape could be viewed. The Deutsch "taxicab" or aerocar was considered to mark an epoch in providing comfort and convenience for passengers; and it was predicted that closed bodies for aeroplanes would soon be developed along lines similar to those used in motor cars.

FRENCH MILITARY TRIALS—TECHNICAL ASPECT. At the trials made by the French War Department in October, the results were based upon

$$\frac{\text{speed} \times \text{useful load}}{\text{fuel consumption}}$$

The actual test consisted in a flight around a measured course with a single passenger beside the aviator. The first place in the competition was achieved by the Nieuport monoplane, which at the end of the year was considered by many critics to be a most advanced type of aeroplane. Aside from the military aspect, this competition was useful in developing many mechanical features and in forming a basis for the comparison of the leading French types. The conditions of the competition involved non-stop flights over a measured course aggregating 186 miles, with a load of 300 kilograms in addition to the fuel for the motor. A mean speed of at least sixty kilometers per hour was required, and the various machines must be easily transportable, and built to land upon and rise from rough ground. They must have a carrying capacity of three persons, and be able to reach a height of 500 metres in fifteen minutes. The Nieuport monoplane, equipped with the Gnome 100-horsepower motor, with M. Weymann as pilot, received the first award, which involved the purchase of the machine at \$20,000, and ten more of the same type at \$16,000 each. Weymann made in the speed trial an average rate of seventy-five miles per hour. Second place was achieved by M. Prévost with a Deperdussin monoplane, also equipped with a Gnome 100-horsepower motor; and third place by M. Fischer with a Henry Farman biplane, and a motor of the same general size and type. Two Maurice Farman biplanes and a Savary biplane also competed, and were placed in the order named. The

second award was the purchase of six machines at \$8000 each, and the third, four machines at the same price. It will be seen, therefore, that at the close of the year the French army was in a position to develop its aeroplane service in a most effective fashion as, in addition to the machines so ordered, a large number had been acquired by individual purchase.

In fact, it was announced that the French War Department would purchase no less than 350 aeroplanes for the army during 1912, ordering these machines in lots of twenty, fifty, and even one hundred from the leading French constructors. Having used some twenty-nine aeroplanes for reconnaissance work in the autumn manoeuvres, it must be assumed that the war office was convinced of their usefulness. The French army aeroplanes were to be known as "avions," in commemoration of the first army aeroplane built and experimented with by Clément Ader in 1897, and preserved in the *Conservatoire des Arts et Métiers* at Paris. These aeroplanes had a distinct military importance which will be considered in an appropriate section of the article on MILITARY PROGRESS.

In connection with the discussion of the value of the aeroplane in warfare, the possibilities were brought out by the fact that on July 3, 1911, eleven aviators in the "Circuit of Europe" competition, flew across the English Channel from Calais to Dover, and a twelfth on the following day, thus making commonplace the achievement of Blériot on July 25, 1909, when this flight first was successfully essayed. Two days later ten of these aviators returned to France, and the fact immediately suggested the possibility of an over-sea invasion by aeroplanes as a military event of the future.

FRENCH AEROPLANE INDUSTRY. The event of the interest in aviation in France was illustrated by the activity of leading French manufacturers. There were six firms, Blériot, Train, H. Farman, Pelterie, Bréguet, and Nieuport, who were more or less prominent among French manufacturers in this field. Their output for the entire year was estimated at 822 machines, of which 410 were sold to various governments, 367 were used in exhibitions and for instruction, and 46 for sport. The output of other large firms, such as Maurice Farman, the Astra Company, Antoinette, Paulhan, Morane; Deperdussin, Sommer, and Voisin, was estimated at over 1600 machines, while at least several hundred were constructed by various individual manufacturers.

Statistics from seventeen French firms elicited figures for some 1300 aeroplanes, with an engine horsepower of about 60,000. These machines had carried more than 5000 passengers, and had made over 3000 cross-country trips in excess of ten kilometers (6.2137 miles) in addition to flights around aerodrome courses, which were estimated at over 500,000 kilometers (310,685 miles). In other words, there were recorded flights for about 1300 aeroplanes which approximated 8300 hours spent in the air. As these figures were compiled during the late summer of 1911, it will be appreciated that the totals for the year would be correspondingly increased.

AMERICAN DEVELOPMENTS

While most of our discussion so far has concerned European conditions, it must not be inferred that American aviators were not active. The original masters of mechanical flight, the Wright brothers, were engaged not only in the

manufacture of their improved biplanes and in the training of aviators, but also in practical experiments undertaken with their usual care and thoroughness to investigate atmospheric conditions, while the possibilities of the aeroplane were widely extended by Curtiss in experiments in which he demonstrated the complete feasibility of rising from the surface of the water or landing thereon. In fact, the Curtiss hydroplane experiments were among the most important of the year.

In 1911 the manufacture of aeroplanes in the United States, as well as in Europe, had reached a point where it might be considered an independent industry. It was estimated that at least 750 aeroplanes were built during the year by manufacturing concerns and by various individuals. Of these about 200 represented the output of our recognized manufacturers, and of 174, the owners of which were definitely known, 64 were purchased for private use, 105 for exhibition purposes, and 11 were sold to various governments. About 425 aeroplane engines were sold during the year, and a number of new types were being developed in addition to the Wright, Curtiss, and foreign motors, such as the Gnome, that were sold in the American market.

WRIGHT GLIDER EXPERIMENTS. In October, 1911, the Wright brothers returned to the scene of their original notable experiments at Kitty Hawk, N. C., and Orville Wright carried on a series of experiments with a motorless glider which was in many respects similar to the model B Wright machine frame, but with a smaller surface of planes and a larger rudder. Flying or gliding in the face of a wind, Mr. Wright was able to attain greater heights, greater distances, and stay in the air longer than in any other flights of this kind previously attempted. Mr. Wright not only was able once more to show his wonderful manipulative skill with an aeroplane in the air, but to study wind and stability conditions free from other considerations. In a 50-mile gale he was able to soar to a height of over 200 feet, remaining in the air 10 minutes and 34 seconds, and advancing his aeroplane about a quarter of a mile.

HYDROPLANES

HYDROPLANES.—The first successful American hydroplane was that of Glenn H. Curtiss, which was shown at San Diego, Cal., on Jan 26, 1911. In March, 1910, Fabre, with a French monoplane he had invented, had shown his ability to rise from the surface of the water. This Curtiss hydroplane of 1911 was a biplane equipped with floats in place of the usual landing skids, following the lines of previous experiments made at Hammondsport, N. Y. The most successful type of machine was fitted with a single long, narrow scow-shaped pontoon, made of wood, 14 feet long, 2 feet wide, and a foot in depth, and capable of sustaining a weight of 1400 pounds. These hydroplanes were fitted with wheels, also, so that they could alight on land as well as water. Several were built for the United States navy, and one has been sent to Russia. With these hydroplanes United States naval officers made some interesting flights at Annapolis. See NAVAL PROGRESS.

In further experiments with the hydroplane Mr. Curtiss found it possible to launch the machine from a wire so that a single guy or

wire could be stretched on a battleship from the boat deck to the bow, and with the aid of two other auxiliary wires to keep the plane from falling, it could glide down until sufficient headway was gained to preserve the balance. This demonstration was considered of importance, inasmuch as it made possible the launch of an aeroplane from a battleship, or other vessel, when the sea was too rough to permit rising from its surface, and at the same time there was required no platform or elaborate arrangement that would interfere with the guns, the wire guys being susceptible of being rigged rapidly and quickly removed.

Aside from such military application, the Curtiss hydro-aeroplane was utilized in an interesting flight down the Mississippi River made by Hugh Robinson, October 17-21, carrying 5000 pieces of mail which were collected and distributed along the route. The trip extended from Minneapolis to Rock Island, a distance of 314 miles. It was abandoned for lack of financial support.

A notable flight of more than 110 miles entirely over water was made by Harry Atwood in a Burgess hydro-aeroplane on December 21 from Lynn, Mass., around Cape Cod to Narragansett Bay, in 2 hours and 45 minutes. The trip was made with one of the pontoons broken, which accident he had met with the night before, in making a flight at Lynn.

OTHER HYDROPLANES, notably of the Wright brothers, in the United States, Voisin in France, and Roe in England, were developed during the year. The Voisin machine, known as the *Canard*, was a biplane with a long body projecting forward in front. It was mounted on four floats designed by M. Fabre and constructed of several layers of veneer. It made many flights on the Seine during the summer of 1911. The introduction of the hydro-aeroplane was considered a great advantage to the development of aviation, as it made possible flights without an aerodrome, or special ground, especially over rivers and canals, with a minimum of danger.

In all the leading countries of the world schools for aviation have been developed aside from those maintained by the different governments for the instruction of military and naval aviators, and aeronauts. The fullest opportunity was offered to purchasers of new machines, and all desiring proficiency in aviation; and the requirements for pilots' licenses were made much more rigorous than heretofore.

The principal American aerodromes in 1911 were at Nassau Boulevard, Mineola, Belmont Park, Bergen Beach, all in the vicinity of New York, Washington Park and Kinloch, St. Louis, two fields near Chicago, one at San Francisco, several near Los Angeles, the army aerodrome at College Park, Md., and a field near Boston. In December the Signal Corps of the United States army, opened a school at Augusta, Ga., for the training of aviators, and an active winter season was promised there. Winter schools were also opened at Palm Beach and Miami, Fla., and at San Diego Bay, Cal. During the year schools were open for the training of aviators at tuition fees ranging from \$250 to \$750 for the course of instruction, and among the more prominent schools have been those of Wright, Curtiss, Burgess, Moissant, Benoist, Atwood, Eaton brothers, Gage, and Schneider.

Up to the end of December, 1911, eighty-two aviation pilots had been licensed in America.

It is interesting to record that No. 1 on this list was Glenn H. Curtiss. The tests for aviators are prescribed by the International Aeronautic Federation and are conducted by the representative of some duly accredited club. The tests included two distance tests, involving a flight of not less than five kilometres (3.11 miles), an altitude test of at least fifty metres, and a landing test to be made by stopping the motor within fifty feet from a point designated by the applicant.

One of the developments of the year was the increased attention being paid to the scientific study of aeroplanes of various types. In France several engineering laboratories were engaged in the study and perfection of the various types. M. Eiffel, the distinguished engineer, continued his experiments which had been carried on since 1905, and Professor Prandtl of Göttingen in a special laboratory was engaged in studying the conditions of the movement of the air in the wind tunnel. These wind tunnels are employed by numerous investigators, and the laboratory equipment for practice and exact study was highly developed.

In connection with the scientific study of aerial problems, there was opened on July 6 an aeronautic institute at Saint-Cyr, founded by M. Henri Deutsch de la Meurthe, who for many years had been a liberal patron of aviation.

AMERICAN FLIGHTS AND COMPETITIONS

Progress in aviation in the United States during 1911 was indicated by a number of important long-distance flights and by competitions in which American and foreign aviators participated. In the long-distance flights the work of American pilots and their machines appeared to good advantage, and more than satisfactory comparison with the best European performances could be made, as will be seen from the summaries given below.

Nevertheless, there was not the widespread interest in aviation, such as was noted in Europe, especially in France, and support by the government was most limited. A number of competitions and meets were held at Los Angeles, Mineola (Long Island), San Francisco, San Diego, Boston, and elsewhere, as well as at fairs and other gatherings, but for the most part without the exceedingly valuable prizes characteristic of the French contests. Nevertheless, such foreign aviators as Sopwith, Grahame-White, and others were attracted to the United States, and participated in various meetings with considerable profit. The work of army and navy aviators was deserving of commendation, especially with the small appropriations available for its prosecution. This is referred to more at length in appropriate sections of the articles on MILITARY PROGRESS and NAVAL PROGRESS.

NOTABLE FLIGHTS

One of the first important flights to take place in 1911 was by J. McCurdy, with a fifty-horsepower Curtiss biplane, in which he flew on January 30 from Key West, Fla., to within ten miles of Havana, Cuba, accomplishing a distance of about ninety miles in two hours and eight minutes. A leak in his oil reservoir necessitated his descent, and he was picked up by the United States torpedo-boat destroyer *Paulding*, which was following him, and taken to Havana, a distance of six miles.

BURGESS HYDRO-AEROPLANE, MARBLEHEAD BAY, DECEMBER, 1911

CURTISS HYDRO-AEROPLANE AT MIAMI, FLORIDA

HYDRO-AEROPLANES OF 1911

Among the noteworthy flights of the year was one by Lincoln Beachey in a headless Curtiss biplane in which on June 27 he made a dip over Niagara Falls, and then flew down through the gorge, passing under the steel arch bridge. This was a thrilling and apparently reckless exhibition, but it served to demonstrate the complete control of the machine by the aviator. Other sensational flights, often over cities, were made by Ovington, Masson, Sopwith, Lewkowitz, Robinson, Ely, Willard, Hamilton, Atwood, Jannus, and others.

ATWOOD'S FLIGHTS. A notable American cross-country flight was that of Harry N. Atwood, which began at Boston on June 30 and ended at Washington on July 11. He employed a Burgess-Wright biplane, and in the course of his flight passed over the course of the Harvard-Yale boat race and the assembled spectators at New London. The longest stage of the journey was from Atlantic City to Baltimore, 122.40 miles. On August 14, Atwood began a flight from St. Louis to New York via Chicago, a distance of 1266 miles. This required twelve days, with a total flying time of twenty-eight hours and fifty-three minutes. The average daily flight amounted to 105.5 miles and average speed of 44.88 miles. There were twenty stages to the journey, which was accomplished without damage on landing and starting and with a minimum of motor troubles, the engine used being the same as on his previous flight and requiring no attention except the rebabbiting of two bearings.

RODGERS' TRANSCONTINENTAL FLIGHT. Perhaps the most important long-distance flight of the year was by Calbraith P. Rodgers in a Wright biplane from New York to Pasadena, California, a distance of 4017 miles, but somewhat greater as actually traversed. This trip involved frequent repairs to the machine, but it demonstrated that long-distance flight was readily realized, and just what troubles must be anticipated and guarded against. Rodgers left Sheepshead Bay near New York on September 17 and was forty-nine days en route to Pasadena, arriving there on November 5. On November 12 at Compton, Cal., on his way from Pasadena to the Pacific Ocean, he fell and was so badly injured that he was delayed until December 10, when he made his actual flight to the actual shore. While Rodgers was forty-nine days making the trip to Pasadena, yet his actual time in flight was but three days, ten hours and four minutes, or an average speed of about fifty miles an hour. His best day's work was 231 miles.

This first trans-continental trip by aeroplane recalled the first motor journey from San Francisco to New York, made in 1903 and requiring sixty-five days. By 1908 this time had been reduced to fifteen days, two hours and twelve minutes, so that a similar rate of development for the aeroplane could be reasonably expected. The mechanical analysis of Rodgers' trip is not without interest. The weather was responsible for the loss of eleven days on the journey, and thirteen and one-half days were consumed in making repairs. These repairs included an aggregate of two and one-half days for the engine and several days where the accidents were caused not by failure or wear of the machinery or planes, but by unfortunate landings or collision with objects. Rodgers repeatedly was able to outdistance the special train that accompanied him, and it was clear that a transcontinental trip in ten days could be achieved with a few

improvements in machinery and devices to insure increased stability in windy weather.

An aeroplane race from New York to Philadelphia for a prize of \$5000, was started on August 5. The competing aviators, L. Beachey, H. Robinson, and E. Ely, all used Curtiss machines, with Curtiss engines, and the winner, Beachey, made the flight of approximately eighty-three miles in one hour and fifty minutes, with a single stop of ten minutes.

At the meeting of the Harvard Aviation Society a tri-State race was held on Labor Day, September 4, over a course of 174 miles, which extended from Boston to Nashua, then to Worcester and Providence, and return to Boston. Two of the four competitors starting finished, and the winner was E. Ovington, in a Blériot machine with Gnome engine. The second was Lieutenant Milling in a Burgess-Wright machine with Wright engine, the net flying time being three hours, six minutes, twenty-two and one-fifth seconds, and five hours, twenty-two minutes and thirty-seven seconds respectively. The prizes were \$10,000 for first place and \$5000 for second.

FOREIGN FLIGHTS AND COMPETITIONS

Throughout Europe the greatest interest was manifested during the year in long-distance flights and competitions for which valuable cash prizes were given, often by newspapers, and in many cases by individuals. The tendency was toward more practical work involving greater distances, and flights from city to city, such as were involved in the "Circuit of Britain" and the "European Circuit" competition, marked noteworthy advances. True, there was much interest in competitions at the various aerodromes, but these too were more practical, looking towards development and improvement of the machines rather than sensational exhibitions. In fact, it might be said as characteristic of the year that the merely spectacular and sensational side of aviation had passed, and the interest of the public while not abated was more general and critical.

An important European flight was made on February 1 by Captain Bellinger, who flew from Paris to Pau, 450 miles, in four stages. Captain Bellinger employed a Blériot monoplane, and accomplished the distance in two days, with a total flying time of ten hours and twenty-three minutes. His first day's flight from Paris to Bordeaux, 330 miles, was made in eight hours and twenty-two minutes. A record of quite a different nature, but also indicating progress in machine construction, was made on February 10, by F. Champel, who in a single day made sixty-two landings with a Blériot monoplane.

On March 5 Lieutenant Bague of the Fourth Algerian Rifles, in an attempt to cross the Mediterranean, in a Blériot monoplane, flew from Cape Antibes, near Nice, Italy, to the island of Gorgona, near Corsica. The air-line distance was estimated at about 124 miles, but the aviator lost his way in the clouds and flew much further, being in the air four hours and thirty-two minutes. This was the record over-sea, non-stop flight for the year. On June 5 Lieutenant Bague attempted a second flight to Corsica from Nice, in the course of which he perished. He was last seen near Cape Antibes by a fisherman, and it was presumed that, accidently overtaking the machine, he fell and was drowned.

PARIS-PUY-DE-DÔME FLIGHT. A special Michelin prize of 100,000 francs for the first aviator to make a trip with a passenger from Paris to the summit of the Puy-de-Dôme, an air-line distance of 220 miles, with one stop, within six hours, was won on March 7, by M. Eugène Renaux in a Maurice Farman biplane with M. Senonque as passenger. His time was five hours and seventeen minutes, of which four hours and fifty-one minutes was actual flying time.

LONDON TO PARIS FLIGHT. An important non-stop flight took place on April 12, and amounted to about 250 miles in three hours, and fifty-six minutes. This was made by M. P. Prier from Hendon near London to Paris, in a Blériot monoplane, and was the record time and distance for a cross-country non-stop flight.

PARIS-MADRID RACE. This important race had a most inauspicious beginning on May 21, in a serious accident whereby M. Berteaux, the French minister of war, was killed, and M. Monis, the premier, injured by the falling monoplane of M. Train, who had lost control of his machine. (See FRANCE.) This accident reduced the number of competitors to but six, and but one of these was able to complete the 842 miles of the course, which was divided into three stages: from Paris to Angoulême, 248 miles; to San Sebastián, 208 miles; to Madrid, 386 miles. The race was started on May 21 and 22, from the aviation field at Issy-les-Moulineaux, and was won by J. Védérines, in a Morane monoplane with a Gnome motor. Védérines' total elapsed time was thirty-seven hours, twenty-six minutes, twelve seconds, or a net flying time of fourteen hours, fifty-five minutes, eight seconds. The second in this competition was L. Gibert in a Blériot monoplane, with a Gnome motor. His machine upset on the last stage from San Sebastián to Madrid. The interesting feature of this race was that it involved the crossing of the Pyrenees Mountains, and in so doing Védérines was compelled to rise to a height of some seven thousand feet. Both Védérines and Gibert were attacked by eagles on this stage of the journey.

EUROPEAN CIRCUIT RACE. On June 18, there was started at Paris this important race for which prizes aggregating some \$97,500 were announced. Like the Paris-Madrid competition its beginning was marred by fatal accidents, in which three aviators, one competitor and two military officers were killed in the presence of some 700,000 spectators assembled at Vincennes. The conditions involved flight from Paris to Brussels, via Liège and Utrecht, then to London via Calais and back to Paris, a total distance of 1073 miles. More than forty started, and of these eight finished. The winner was Lieut.-Jean Conneau in a Blériot monoplane. His total time was fifty-eight hours, thirty-eight minutes, and four-fifths second. Second and third respectively, were Garros, also in a Blériot, and Vidart in a Deperdussin; Renaux in a Maurice Farman biplane carried a passenger for the entire trip. Lieutenant Conneau's share of the prize money was \$21,244.

PARIS-ROME RACE. A prize of \$20,000 was offered for a race from Paris to Turin via Rome, a distance of 1300 miles. This race, which attracted twelve starters from a field of twenty-one entries, was never finished, so only four of the contestants were able to reach Rome where it was abandoned. It was started on May 28,

and the conditions prescribed that contestants should alight where and when they desired so long as the time limit of June 15 was not exceeded. The best performance was by Lieutenant Conneau in a Blériot monoplane. Other competitors were R. Garros, also in a Blériot, A. Frey in a Morane monoplane, and H. Vidart in a Deperdussin monoplane. Frey when on the third stage fell near Ronciglione, Italy, breaking both arms and legs.

CIRCUIT OF BRITAIN RACE. This competition, organized by the London *Daily Mail* with a prize of \$50,000, provided for a 1010 mile circuit of Great Britain in five sections. The start was at Brooklands near London, and the towns included were Edinburgh, Glasgow, Carlisle, Manchester, Bristol, Brighton, and back to London. There were thirty entries, and nineteen starters crossed the line on July 22. Of these seventeen finished the first section, from Brooklands to Hendon, five traveled to Edinburgh, 363 miles, while four completed the circuit. The winner was Lieut. Jean Conneau ("Beaumont") in a Blériot monoplane, with a net time of twenty-two hours, twenty-eight minutes, nineteen seconds. The second was Jules Védérines in a Morane-Borel monoplane, with a net time of twenty-three hours, thirty-seven minutes, fifty-four seconds. Valentine, with a Deperdussin monoplane, and S. F. Cody, with a Cody biplane, finished third and fourth on August 4 and 5 respectively.

Other long-distance competitive flights held during the year were the German National Circuit, 1850 kilometers (1168 miles), for a prize of \$25,000, which was won by Benno Koenig, with a passenger, on an Albatross biplane, and the Russian Circuit, 380 miles, for a prize of \$50,000, won by Vasilieff on a Blériot monoplane.

GORDON BENNETT AVIATION TROPHY. The annual Gordon Bennett trophy race in 1911 took place on July 1 at Eastchurch, England, in virtue of the fact that Great Britain held this cup, which had been won in 1910 in the United States by Grahame-White. The distance for this competition was twenty-five circuits round a course of six kilometres, the entire distance aggregating ninety-four miles. The competition in 1911 was won by C. Weymann, representing the United States, in a Nieuport monoplane, his time being 71 minutes, 36.5 seconds. A. Le Blanc of France, with a Blériot monoplane, was second with a record of 74 minutes, 40.2 seconds. E. Nieuport of France, with a Nieuport monoplane, third, with 74 minutes, 37.2 seconds, and A. Ogilvie of Great Britain, in a Wright biplane, fourth with 109 minutes, 10.4 seconds. Other competitors did not finish.

The Femina cup, which in 1910 was won by Mademoiselle Hélène Dutrieu, with a record of 103¾ miles in two hours and thirty-five minutes, was again taken by this distinguished aviatrix, who on December 31 at Etampes, with a Henry Farman biplane increased the distance to 159 miles. On the same day Jeanne Hervieu in a Blériot machine started from Compiègne and made a flight of 155 miles.

The Quentin-Bauchart prize of \$10,000 for aggregate mileage in officially observed flights between May and October was won by M. Maurice Renaux in a Maurice Farman biplane, with 6600 kilometers (4100 miles) to his credit.

The award of the Statue of Liberty prize of \$10,000, made in 1910, was reversed at a meet-

ing of the International Aeronautic Council in Rome in November, and Grahame-White's protests against John B. Moissant and Count de Lesseps were sustained, and the prize awarded to the English aviator. This race, it will be recalled, which was flown at the Belmont Park meeting of 1910, was for the best performance from that point to the Statue of Liberty and back.

SPEED RECORDS. During the year 1911 the speed record for an aeroplane was increased from 67 to about 83 miles per hour. This was achieved on June 21, 1911, at Mourmelon by E. Nieuport in the Nieuport monoplane, in a flight in which he made a record of 4 minutes, 30½ seconds for 10 kilometers, or a speed of 82½ miles per hour. Previously, on June 16, Nieuport made world's records for 5, 20, 30, 40, 50, and 100 kilometers, the last named distances being made in 46 minutes, 27½ seconds. Speed records of 93 miles an hour for short distances were also claimed for Védérines and Nieuport.

The Duration Record for the longest time in continuous flight was raised on September 1 from 7 hours and 18 minutes, scored by Tabuteau in 1910, to 11 hours, 1 minute, 20½ seconds at Buc by Alexander Fourny, who covered 720 kilometers (447.38 miles) on his Maurice Farman biplane with Renault motor. This was also the record for longest non-stop flight until it was supplanted on December 24 by M. Gobé, on a Nieuport monoplane. He remained aloft 8¼ hours while traversing a closed circuit in the "Criterium de l'Aéro Club" contest, formerly known as the race for the Michelin cup, and covered 740 kilometers (459.81 miles) at an average speed of about 55¼ miles an hour. This contest was for the greatest distance over a closed circuit in one continuous flight. Gobé carried 220 liters of gasoline and 60 liters of oil aloft at the start, and had enough left for 3 hours more when he landed. The flight was made in a wind of 10 to 12 miles per hour.

In 1911 the altitude record of 11,642 feet, made by L. Beachey at Chicago with a Curtiss headless biplane on August 25, was supplanted by R. G. Garros, who on September 4, in a Blériot monoplane with a Gnome motor, at Paramé, rose to the height of 12,792 feet, thus reaching an altitude above the earth's surface in excess of two and one-half miles. New altitude records with passengers were made by H. Hirth in an Etrich monoplane, who flew to a height of 2475 meters (8120 feet), with a single passenger at Berlin, October 1; while Lieutenant Bier in a monoplane of the same type, with two passengers, rose to a height of 1220 meters (4003 feet) at Wiener Neustadt, September 29.

MAIL BY AEROPLANE. During 1911 a number of flights were undertaken to show the possibility of mail by aeroplane. In India experiments along such lines had been undertaken, and on March 14, an aerial post was established in connection with the United Provinces Exhibition, and letters and post cards were carried by aeroplane from the grounds to Allahabad. In France Pierre Védérines on August 13 made a noteworthy flight from Issy-les-Moulineaux to Deauville, near Trouville, a distance of 112 miles, carrying on the aeroplane a package of mail. He made the trip in one hour and forty-three minutes, or at a rate of somewhat better than sixty-five miles an hour. This was faster by one hour and nineteen minutes than the time of the fast railway express between these two cities. In

England on September 8 an aerial mail service was established for a week between Hendon, near London, and Windsor, a distance of twenty miles, with the coöperation of the General Post Office, the proceeds being devoted to charity. Over 100,000 pieces of mail were handled. In connection with the aviation meet at the Nassau Boulevard Aerodrome on Long Island, N. Y., in September, an aerial post was maintained and letters and cards mailed in boxes on the grounds were carried to a tent, sorted, stamped, and placed in mail sacks which were carried by aeroplane to Mineola, and there given to the postmaster. On one occasion United States Postmaster-General Hitchcock was a passenger on a biplane with Captain Beck, and personally carried the mail sack. The mail service was maintained with but one day's interruption during the entire meet.

DIRIGIBLE BALLOONS

The status and general usefulness of the dirigible airship at the end of the year 1911 was a subject about which there was considerable difference of opinion. In Germany and France military dirigibles had been developed at considerable outlay, since the first airship of Count Zeppelin of 1900, and those launched in 1911 showed considerable improvement over older types. On the other hand, their performance in military manœuvres was a matter of dispute, and most unprejudiced military authorities believed that the aeroplane, costing but a fraction of an airship, and readily mastered and operated in various conditions of weather, was far more useful, particularly since a fleet of aeroplanes could be procured for the same expense as a dirigible, and did not require the gas-generating apparatus or other appliances inseparable from a large airship. It was true that the military dirigible could be used for offensive purposes, but on the other hand, it presented a large target, and it was at the mercy of high winds and unfavorable weather conditions. Furthermore, the difficulty of use and maintenance as well as other shortcomings were emphasized by the various accidents mentioned below, and the fact that the German army, whose balloon service had been most generously supported in previous years, was devoting rather more attention to aeroplanes at the end of 1911, seemed to indicate their inability to meet present tests, and that future developments in the field of dirigibles were not so promising as in aviation.

On the other hand it was shown that the Zeppelin airship could rise to a height of 6500 feet and carry a considerable weight, which in the form of high explosive could be dropped with manifest injury to a town, not only direct, but producing panic. Furthermore, with a radius of 600 miles and ability to rise and descend, scouting trips of great value could be made. This naturally suggested the arming of airships and aeroplanes and combats between aerial scouts and bombships were considered inevitable in the event of hostilities. As a matter of fact the German airships were being mounted with guns.

In commercial work progress was made by a new Zeppelin airship, the *Schwaben*, which ran on various sight-seeing trips, even more extensively than the ill-fated *Deutschland* and *Zeppelin VI*. in the previous year. But it was considered that novelty contributed more to the suc-

cess of this venture than the possibilities of realizing safe and rapid commercial travel.

PROGRESS IN DIRIGIBLES

THE AIRSHIP "SCHWABEN." The most important development of the year was the Zeppelin airship *Schwaben*, which was operated on schedule for tourist trips about Germany. The airship was a successor in design of the famous *Deutschlands*, the first of which, launched in 1910, was wrecked the same year, while the second, launched in 1911, was broken in two by collision with its own shed. The *Schwaben*, under construction at the time of this accident, was a somewhat smaller airship, displacing 634,500 cubic feet, as compared with the *Deutschlands*' 667,560. It was 462 feet long, 46 feet beam, and had 17 gas cells. It developed a speed of almost 43 miles an hour on its trial trips over a measured course. For this airship satisfactory 6-cylinder motors were developed with 165-horsepower, so that even on trips as long as 700 miles they operated without trouble. The *Schwaben* had a conical bow, and great care was taken in stretching the covering over the frame, so that it appeared absolutely smooth and solid. The rudders were improved so that it was possible completely to turn the large airship within a circle of 1600 feet diameter. Improvements in the design of the propellers secured greater efficiency, and the various means of control and handling were improved. The passenger-carrying facilities—notably the corrugated aluminum cabin—were improved with an idea to maximum comfort, and the arrangements for docking and landing were developed in the interest of increased safety to both airship and passengers.

Anchorage facilities, where there were no sheds, were provided for the large military and other dirigibles near almost every German city, so that with four cables instead of one a much greater measure of safety was insured. Tickets for sight-seeing trips were sold at \$50 each per person and in a series of eighty-one ascents, which included nine long voyages, 1675 passengers were carried, including six German princes in one of the November trips. The aggregate distance during the season was 10,811 kilometers.

There was exhibited during the year a tendency to develop miniature dirigible balloons that were cheaper and handier than the Zeppelins and the Parsevals. The Villehad-Forsmann dirigible was of 800 cubic meters capacity, yet it weighed only about 1000 pounds. It was of the non-rigid type with a single ballonnet and had a 24-horsepower engine direct coupled to the propeller. Its speed was up to twenty-five miles an hour, consequently its usefulness was limited to light breezes.

In France successful work was done with the dirigible. The *Capitaine Maréchal*, a semi-rigid type of dirigible, made successful trial flights on March 24 and was used successfully in September in connection with the French army manoeuvres about Châlons. Two airships of the non-rigid type, the *Adjutant Vincenot* and the *Adjutant Reau*, made notable flights during the year, the former remaining in the air on one occasion thirteen hours and forty minutes and maintaining wireless communication with Verdun and Paris. The former, in addition to making an altitude record of 6453 feet on June 19, a little later, July 8, made a trip of 410 miles

in a closed circuit in sixteen hours, fifty minutes, with eight passengers. On September 19 the *Adjutant Reau* made a trip of 573 miles in twenty-one hours, 20 minutes, carrying eight passengers and two tons of supplies, a record for distance and duration. To these three airships at the end of the year was added the *Lieutenant Sells de Beauchamp*, the four names being those of the officers who perished on the ill-fated *République*. The *Beauchamp*, as do the others, follows the Lebaudy type with single short car, but has the vertical stabilizing fin at the extreme stern suppressed and replaced by fixed surfaces which form part of the vertical rudders. All rudder surfaces were doubled, as was the tendency of modern airships of very large size, which meant a saving of weight, and the horizontal rudders were placed amidships where they acted more as aeroplanes, lifting or depressing the ship while maintaining an even keel. There were two air ballonets, and the blowers were mounted on the frame above the car, being driven by a long transmission. The frame is long and deep, well trussed underneath the car so that while the airship possesses great strength yet there is considerable air resistance.

The development of Lebaudy airships for military purposes was going on vigorously in France, and, as in Germany, they figured in the manoeuvres of the year. European military aeronauts were considering the offensive possibilities of dropping one-ounce bullets from great heights. These bullets would serve at the beginning of a trip as ballast and a considerable weight could be transported.

The latest military dirigible of the year was the German *L. Z. 9*, which was launched in October. It was a large airship with three motors which propel the balloon at a speed of forty-eight miles an hour.

The French Military Aeronautical division was increasing its facilities for dirigible balloons. In addition to the hangars at Issy and Moissons, the only balloon sheds over 400 feet in length, new buildings of this length but capable of being increased in size were being added at Verdun, Belfort, Epinal, and Trel, and new sheds were planned for Mézières, Montaigne, camp of Châlons, and Langres. Each will be designed to accommodate two large dirigibles. There were also in operation a number of factories for the generation of hydrogen, and a plant with a capacity of 360,000 cubic feet a day was planned for Châlons.

DISASTERS TO GERMAN DIRIGIBLES. Notwithstanding the great progress Germany had made with military dirigibles, there was to be recorded during the year a series of disasters to six great airships. On March 16, the *Parseval VI* met with a serious accident in which its envelope was destroyed, and both the *Ersatz-Deutschland*, a new Zeppelin airship, and the *Parseval II* were wrecked in the month of May. On June 3 the *Ruthenberg*, an airship of the Siemens type, was wrecked on its trial trip, and on the 26th of the same month the *Parseval V* was seriously damaged by fire. The military dirigible *M3* also had its envelope destroyed by fire on September 13 after it had made some successful trial trips. Notwithstanding these misfortunes there were three German airships of the semi-rigid type able to take part in the autumn manoeuvres.

WRECK OF BRITISH DIRIGIBLE "MAYFLY." The first non-German rigid dirigible met with

a disastrous accident upon leaving its shed September 24 a few months after its completion. It had been building for over two years at Barrow-in-Furness, by Vickers, Ltd., and was designed to embody the best features of Continental construction. It was the largest dirigible constructed, having a gas capacity of 700,000 cubic feet. It was over 500 feet in length, forty-eight feet in diameter, and had a lifting capacity of twenty-one tons. It was driven by two Wolseley engines each of 200-horsepower. The airship was designed for a capacity of twenty-two passengers and crews, and cost the British government over \$200,000 at the time of its completion and launching on May 22. The rigid framework contains seventeen independent gas chambers, which together formed a cylinder with tapering ends. The accident which destroyed the *Mayfly* was caused by the failure of the central part of the frame, and deflation of a single compartment due to an accident caused by leaving the shed in a cross wind. Previously, on May 22, the British *Lebaudy* had been wrecked at Farnborough, and while four other airships were carried on the British military strength at the end of the year, two of these were out of service and dismantled. At that time the British war office was more actively concerned with the consideration of aeroplanes than with the future building of airships.

PROPOSED TRANSATLANTIC EXPEDITIONS. In no way daunted by the destruction and loss of the airship *America* in 1910, Melvin Vaniman, with the coöperation of F. A. Seiberling, of the Goodyear Tire and Rubber Co., of Akron, Ohio, constructed during 1911 for a transatlantic expedition a new dirigible balloon, named the *Akron*, based essentially on the plans of the *America*. It was 258 feet in length, with a diameter of forty-seven feet, and carried a car considerably longer than that of its predecessor. It had a body frame and a steel tank, having a capacity for five tons of gasoline, over which on a platform there were three engines. The forward engine of 100-horsepower drives propellers rotating in a vertical plane, while engines of 100- and 80-horsepower, respectively, drive dirigible propellers whose plane of rotation may be varied to any desired angle. Normally, the forward engines only were to be used and were estimated to give a speed of about thirty miles per hour. Sufficient gasoline was to be carried to last for about one week. A novelty in the *Akron* was the use of water ballast and stabilizing places, fore and aft. It was planned to maintain the airship at a height of between 200 and 1000 feet, and, with the lightening of the craft by the consumption of gasoline and provisions, it was anticipated that toward the end of the voyage it might rise to greater heights. Sufficient fuel was to be taken to last about one week, and every care was manifested in building the machine to avoid the weaknesses which developed in the *America*. The equilibrator which was used on that airship was to be replaced by the self-filling water ballast tanks, as Mr. Vaniman was convinced that fundamentally this idea was of considerable merit. Towards the end of the year everything was in readiness for the initial trip, but beyond taking the airship out of its hangar at Atlantic City and making a brief trial trip on November 4, no voyage was undertaken.

THE "SUCHARD." In Germany the airship *Suchard* was also building for a transatlantic

trip. This was a dirigible balloon 250 feet in length, with a diameter of fifty feet in the centre. It was built for a transatlantic expedition planned by Dr. Paul F. Gans, and was christened at Kiel, Germany, February 15, 1911, by Princess Henry of Prussia. Dr. Gans proposed to start from Teneriffe, Canary Islands, by flying with the trade winds from the northeast and reach the West Indies, ending his flight at Barbados with the possibility of continuing it to the coast of Florida if conditions were favorable. This plan was based largely on a study of meteorological conditions, and was radically different from those of Wellman and Verman. Dr. Gans visited the United States late in the year to interest naval officers and others in his proposed expedition, which he thought could be made ready by March, 1912. The airship was fitted with two motors of 110-horsepower, designed to make a speed of twenty miles an hour, in addition to the velocity of the trade wind. At night the power was to be shut down, and the balloon was to be driven with the favorable wind. To keep the big, cigar-shaped gas envelope fully distended there were provided three air ballonets into which air could be pumped as required. The estimated duration of the trip was five days. The air pump was worked by a small motor which, in addition, operated winches for the cable to which the buckets used for dipping up sea-water ballast were attached. The general fittings and equipment of the *Suchard* were in the main similar to those of the *Akron*, the great difference in the plan being the use of favorable meteorological conditions as an important feature.

AEROSTATION

INTERNATIONAL BALLOON RACE—BENNETT CUP SUMMARY. The Bennett Cup competition for spherical balloons in 1911 did not develop any new records, or mark anything unusual, except general enthusiasm in this field of aeronautics. The race was started from Kansas City, Mo., on October 5, 1911, six contestants representing Germany, France and the United States, and the order in which they finished was as follows:

Berlin II. (Germany)—Lieut. Hans Gericke, pilot; S. O. Duncker, aide; landed at Holcombe, Wis., distance 471 miles. Time 12 hours, 28 minutes, 20 seconds.

Buckeye (United States)—Lieut. F. P. Lahm, pilot; J. H. Wade, Jr., aide; landed at Millston, Wis., distance 408 miles. Time 8 hours, 47 minutes, 30 seconds.

Berlin I. (Germany)—Lieut. Leopold Vogt, pilot; Lieut. M. Schoeller, aide; landed at Austin, Minn., distance 350 miles. Time 16 hours, 16 minutes.

Million Population Club (United States)—John Berry, pilot; Paul McCullough, aide; landed at Mason City, Iowa, distance 293 miles. Time 23 hours, 2 minutes, 30 seconds.

America II. (United States)—William F. Assman, pilot; J. C. Hulbert, aide; landed at Emmetsburg, Iowa, distance 275 miles. Time 7 hours, 46 minutes, 30 seconds.

Candor III. (France)—Emile Dubonnet, pilot; Pierre Dupont, aide; landed at Mingo, Iowa, distance 200 miles. Time 27 hours, 22 minutes, 30 seconds.

At the same time the International Balloon Race was held at Kansas City, the race for the Lahm Cup was started with five competitors.

This competition was won by the balloon *Kansas City II.*, Captain Honeywell, pilot; John Watt, aide. A landing was made on the following day at Kennen, Wis., after a trip of 460 miles in fifteen hours and two minutes.

The National Balloon Race was held at Kansas City on July 10, and was won by *St. Louis IV.*, Lieut. F. P. Lahm, United States army, pilot, who with Lieut. J. F. Hart made a trip of 480 miles in twenty-two hours and twenty-six minutes, landing at La Paz, Neb., the following day. Six other competitors participated in the race. An intercollegiate balloon race on June 3, with competitors from the University of Pennsylvania, Dartmouth College and Williams College, was won by the balloon *Pennsylvania*, which made a trip of 115 miles from North Adams, Mass., to West Peabody, Mass., in seven hours and two minutes.

All things considered, ballooning in the United States was not as popular in 1911 as in 1910, as but 116 trips were recorded against 142 ascents in the previous year. In addition to the pilots, 233 passengers were carried aloft. An interesting feature of the year was the successful use of treated natural gas at the big races at Kansas City, with considerable saving in expense over hydrogen gas. The natural gas was heated by passing it through the generator of a water-gas plant. In passing through the body of hot coke the natural gas was partially decomposed and free hydrogen was liberated. This then went through the same treatment as ordinary water gas, and the machine used was found to have a capacity of 50,000 cubic feet an hour.

LEGISLATION. A contribution to the solution of the legal problems brought up by aeronautical progress was the passage by the British Parliament on June 1 of the Aerial Navigation bill, which conferred on the Home Office the power of restricting aviators from flying over areas where the general public would be likely to be placed in danger by such flight. Already at the university boat race on April 1, six aeroplanes had flown over the Thames course, and this legislation had particular reference to the crowds collected for the coronation. In the United States several such flights were made by aviators over ball fields and other places where throngs were collected, and while they did not lead to legislation, yet the practice was universally condemned.

Towards the close of the year a ministerial decree regulating aerial navigation in France was countersigned by the various ministers and approved by President Fallières in the form of a charter, which to become a law as was desired must be passed by the French Chamber and Senate. The decree provided that no steerable balloon or aeroplane would be permitted to navigate over French territory unless with a navigation certificate obtained from the government, after the inspection and tests of the airship and the issue of a proper number. Restrictions were placed on the liberty of aerial navigation, and airships were prohibited from landing in towns and villages, except on such stopping places as were to be specially designated. The passing of airships over interdicted territory without special authorization was forbidden, as well as the transport of either pigeons, explosives, arms, or ammunition. The transport and use of photographic apparatus was forbidden without a special permit, as well as the use of either wireless telephone or telegraph instruments.

The pilot of an airship must possess a proper certificate, and must keep a log book in which essential details of passengers, trips, accidents, etc., must be inscribed. Rules were also provided for airships going over foreign countries, and for the display of lights by dirigible balloons while navigating between sunset and sunrise. Aeroplanes must carry a signal light showing a red light to the left and a green light to the right. The navigation of foreign military airships over French territory was prohibited. The French government airships were freed from various restrictions in the decree. The control of exhibition flights and the omission of aerodromes from certain of the restrictions imposed were also provided for. Certain rules of the road were promulgated, and it was provided that an aeroplane meeting a dirigible balloon at about the same altitude must alter its course. In this proposed legislation the term "airship" applies to both dirigible balloons and aeroplanes. The decree and charter were considered of unusual interest as marking the beginning of legislation which, sooner or later, must be enacted in all countries. In fact, certain bills had been framed for that purpose in the United States.

FATALITIES OF 1911. The death roll of the year numbered over a hundred fatal accidents. Many of the aviators perishing were among the most proficient and promising of the pilots and inventors. This was an increase over previous years, but the more extensive use of the aeroplane must be taken into consideration, and the fact that men and women of more ordinary gifts were entering a field after brief training which but a few years previously was occupied solely by those well qualified in physique, temperament, and training. There were a number of fatalities due to recklessness at public exhibitions, which in general was condemned by the more enlightened public and by the majority of aviators, and there were also deaths due to the breaking or failure of machines, but this last feature was hardly so conspicuous as in the preceding year, and it promised to decrease with the development of the art. The number of deaths due to explosions of gasoline and burning of the planes either in the air or upon reaching the ground was distressingly large. It must be considered that by 1911 flights were being made in strong winds instead of the calm days previously utilized. Furthermore, increased speeds were the order, and this, while increasing safety in the actual flight, made a greater risk of accident when landing. Estimates by Col. Bouttiaux of the French army and M. Sec, based on the distance flown per fatal accident indicated that in 1911 nearly 5000 miles of flight were represented by each fatality, while in 1910 the corresponding number was 3500 miles.

The more notable fatal accidents of the year are listed below:

Jan. 9. Edouard Roussijan, Belgrade, Servia. Lost propeller.

February 6. Lieut. Stein, Doeberitz, Germany. Fell in Wright biplane from height of 65 feet.

Feb. 9. Jules Noël, Douai, France. Collapse of wings of new monoplane.

Feb. 9. M. Delatorre, Douai, France. Fell with above.

March 8. Arturo Villati, Madrid, Spain.

March 20. Paul Keyser, Crefeld, Prussia.

March 28. M. Cei, Paris, France. Caudron biplane. Motor failure.

April 14. Lieut. Byasson, Chevreuse, France. Monoplane capsized in air.

April 17. Capt. E. Carren, Versailles, France. Broken plane in cross-country flight. Fall.

April 20. Louis Liete, Châlons, France.

April 25. William G. Purves, Baton Rouge, La. Fell in Gates biplane on March 5.

May 1. Mattevitch brothers, Sebastopol, Russia.

May 4. M. Cacheux, Kiewitt, Belgium.

May 6. René Vallon, Shanghai, China. Exhibition flight in Sommer biplane.

May 10. Lieut. George E. M. Kelly, U. S. A., Fort Sam Houston, Texas. Lost control. Curtiss biplane.

May 11. Hans Bockemüller, Johannesthal, Germany. Paulhan monoplane. Collision with building in a mist.

May 17. Addison V. Hartle, Los Angeles, Cal. Biplane of own design. Failure due to detachment of ailerons.

May 18. Lieut. Paul Depuis, Rheims, France. R. E. P. monoplane, capsized and took fire on reaching ground.

May 18. Pierre Marie Bournique, Rheims, France. Passenger with above.

May 21. Maurice Berteaux, Minister of War, Issy-le-Molineaux, France.

May 23. C. Laemmlin, Strassburg, Germany. Collision with tree.

May 25. George Benson, Hendon, England. Valkyrie monoplane. Lost control.

May 27. M. Charsky, St. Petersburg, Russia.

May 27. M. Smith, St. Petersburg, Russia. Sommer biplane.

May 27. Edward Farrell, Lansing, Mich.

May 28. Ciro Cirri, Voghera, Italy. Blériot monoplane. Caught fire in air.

June 3. S. Quarez, São Paulo, Brazil.

June 5. Marcel Pennot, Havana, Cuba. Bad landing.

June 6. Lieutenant Brague. Lost at sea on a flight to Corsica.

June 8. Sig. Marra, Rome, Italy.

June 9. George Schendil, Johannsburg, Germany. Lost control in high wind and fell 6000 feet.

June 9. Herr Voss, Johannsburg, Germany. Mechanic with above.

June 9. Vincenz Weissenbach, Weiner-Neustadt, Austria. Fell in monoplane of own design.

June 18. Capt. Princetau, Paris, France. Gasoline explosion; burned to death.

June 18. U. Le Martin, Paris, France. Broken steering gear. Blériot monoplane.

June 18. M. Landron, Paris, France. Gasoline explosion. De Pishoff monoplane.

June 26. George Blondell, North Sea.

June 26. Leon Corbin, North Sea.

June 27. Richard Miller, Wesser, Idaho.

June 29. Lieut. Trochon, Châlons, France. Farman biplane. Bad control.

June 30. Lemar, Coshocton, Ohio.

July 6. Charles Schultz, Phillips, Okla.

July 13. Daniel A. Kreamer, Chicago, Ill. Lost control.

July 14. Edouard Paillette, Algiers. Capsized in wind gust.

July 21. Mme. Denise Moore, Etampes, France. Fall from capsized biplane.

July 23. H. Joly, Juvisy-sur-Orge, France. Fall from Voisin biplane. Lost control.

July 25. M. Shimansky, St. Petersburg, Russia. Passenger; fell from capsized biplane.

July 26. Harry Darnell, Plainfield, Ill. Lost control of machine and drowned in Lake Michigan.

Aug. 2. Gerald Napier, Brooklands, England. Bristol biplane. Caught by gust of wind.

Aug. 15. William R. Badger, Chicago, Ill. Collapse of planes. Baldwin biplane.

Aug. 15. St. Croix Johnstone, Chicago, Ill. Lost control of machine and drowned in Lake Michigan. Moissant monoplane.

Aug. 18. Lieut. Theodore Ridge, Aldershot, England, British army *Canard* biplane.

Aug. 20. Frank Cranford, Marion, Ill. Fall from parachute.

Aug. 29. Lieut. Zolotnehin, St. Petersburg, Russia.

Sept. 1. John J. Frisbie, Norton, Kan. Machine turned over in a gusty wind; machine was crippled before start.

Sept. 2. H. C. Browne, Charlotte, N. C.

Sept. 2. Capt. de Camine, Nangis, France. R. E. P. monoplane. Fall due to breaking of wing.

Sept. 2. Lieut. de Grailly, Rigny, France. R. E. P. monoplane. Breaking of wing and fire.

Sept. 2. M. Marron, Chartres, France. Aeroplane caught fire. Savary biplane.

Sept. 3. M. Leforrestier, Huelva, Spain. Fall due to fire; machine of own design.

Sept. 7. Lieut. Newman, Mühlhausen, Germany. Aeroplane caught fire in cross country flight. Fall of 60 feet.

Sept. 7. M. Lecomte, Mühlhausen, Germany. Aeroplane caught fire. Passenger with Newman.

Sept. 7. Paul Senge, Karlsruhe, Germany. Fall.

Sept. 7. Carlos Tenaud, Lima, Peru. Injured in fall previous February.

Sept. 9. Raimund Eyring, Esslingen, Germany. Collision with flagpole.

Sept. 12. Lieut. Chotard, Villecoublay, France. Fall of 300 feet.

Sept. 16. Edouard Nieuport, Verdun, France. Caught in wind gust and was injured on hard landing.

Sept. 17. Lieut. R. A. Cammel, Hendon, England. Expert pilot; fell on first flight with Valkyrie monoplane.

Sept. 19. Louis Rosenbaum, De Witt, Iowa. Killed by fall of 600 feet.

Sept. 19. Edward Berlinger, Rockville, Conn. Fall from parachute.

Sept. 22. Tony Castellane, Mansfield, Pa. Fall of 500 feet.

Sept. 22. Frank H. Miller, Dayton, Ohio. Burned to death in biplane.

Sept. 25. Charles B. Clarke, Nassau, L. I. Fall. Inexperienced use of Queen monoplane.

Sept. 25. Ray J. Raymond, St. Louis, Mo.

Sept. 29. Capt. Engelhardt, Berlin, Germany. Killed by fall. First pilot in Germany taught by Wright brothers.

Oct. 2. Cromwell Dixon, Spokane, Wash. Fell as result of too sharp a turn. Curtiss biplane.

Oct. 5. Capt. John Broder, Tifton, Ga.

Oct. 11. James Kinny, Joplin, Mo. Struck by biplane.

Oct. 12. M. Horta, Charlesville, France.

Oct. 12. R. Level, Rheims, France. Fall of 250 feet in military trials. Savary biplane.

Oct. 14. Hans Schmidt, Bern, Switzerland. Burned to death in mid-air.

Oct. 19. Eugene Ely, Macon, Ga. Lost con-

trol of machine while making a dip. Curtiss biplane without front rudder.

Oct. 21. Herr Tachs, Hamburg, Germany. Fall.

Oct. 27. Jean Desparmet, Rheims, France. Fall of 600 feet. Blériot monoplane.

Oct. 31. Prof. John J. Montgomery, San José, Cal. Fell to death in a glider of his own construction.

Nov. 15. Samuel Heiler, Perkins, Okla.

Nov. 15. Herr Pletchker, Berlin, Germany. Fall of 150 feet. Albatross monoplane.

Nov. 25. Baron Freitag von Loringhoven. Berlin, Germany.

Dec. 2. Herr Reeb, Munich, Germany. Fall during cross-country flight.

Dec. 2. Tod Schriener, Ponce, Porto Rico. Fall of 200 feet. Baldwin biplane.

Dec. 6. Hubert Oxley, Scarborough, England. Fall.

Dec. 6. Robert Weiss, Scarborough, England. With above.

Dec. 13. Lieut. Charikos Lantheaume, Medun, France. Fall of 1500 feet.

AEROPLANES. See **AERONAUTICS**; and **NAVAL PROGRESS**, paragraphs *Naval Aeronautics*, *Guns and Gunnery*, *Torpedoes*.

AFGHANISTAN. A monarchy in central Asia. Area, about 225,000 square miles; population, estimated at 5,000,000. The capital is Kabul, with about 70,000 inhabitants; Herat has 45,000; Kandahar, 35,000. Agriculture occupies the majority of the population, and wheat, barley, lentils, rice, millet, corn, and pulse are grown. Fruits abound, and quantities are preserved for export. Sheep and transport animals are raised. Copper is found, as well as lead, iron, gems, and gold. The principal manufactures are silk, woolens, haircloth, and carpets. Trade (1910) with India, £845,465 imports and £696,088 exports; with Russia, 400,000 and 4,000,000 roubles. The revenue, which is not accurately calculable, consists largely of payments in kind. The Sind-Pishin railway terminates at Chaman, on the frontier, 65 miles from Kandahar. Foreign relations are sustained only with the British-Indian government; commercial, with India and Russia. The ameer (1911, Habib Ullah Khan) receives a subsidy of Rs. 180,000 from the Indian government; he is an absolute despot, and the provinces are administered by nobles under a sort of feudalism. A native British agent (1911, Malik Talib Mehdi Khan) resides at Kabul.

ARMY. A regular army is maintained by conscription and is under the command of the ameer's brother, Sardar Nasrullah Khan, who was appointed commander-in-chief in 1903. While service is obligatory, only about one man in eight is called upon to serve, and as a result the army in 1911 comprised about 27,000 infantry and 7000 cavalry, in addition to a strong force of artillery which were armed with guns of modern European pattern. In addition, the irregular troops comprise some 25,000 mounted men, and a smaller force of infantry which are either the retainers of various tribal chiefs or are organized as auxiliary to the regular infantry. The Afghan army was organized and trained on a modern European basis, and the artillery, particularly as regards equipment and personnel, was considered highly efficient. Official ordnance works and arsenals under European superintendents were maintained at Kabul. The equipment of arms available was sufficient for

an army of 100,000, but the force actually in service was estimated at little more than one-half this amount.

AGRICULTURAL EDUCATION. Since 1907 the facilities for teaching agriculture and the number of students of this subject have increased rapidly. In foreign countries agricultural colleges or agricultural schools have been established in Australia, Canada, China, England, Finland, France, India, and Japan. In the United States the agricultural colleges have more students, larger incomes, and have added about \$20,000,000 to their permanent endowment and equipment. The institutions offering secondary courses in agriculture have probably doubled in number. In 1908 there were 40 independent agricultural schools supported wholly or in part by State funds, now there are 77 of these schools; then there were no State-aided courses in agriculture in public high schools, now there are 251. In all, about 2000 public and private high schools now report having students in agriculture. The facilities for training teachers of agriculture have also increased. In 1908 there were 156 normal schools teaching agriculture; now there are about 220 institutions giving such training, including a large percentage of the State agricultural colleges.

In Argentina the National Agronomic and Veterinary Institute was united with the University of Buenos Ayres at La Plata. The first educational train to be run in Great Britain was a poultry demonstration train, fitted up with improved poultry appliances and other illustrative material, which was run for eight days over the railroads in Wales. A farm school was opened at Kingston, Jamaica, to give boys about fifteen years of age three years' training in tropical agriculture.

The legislature of British Columbia set aside 170 acres at Point Grey, a suburb of Vancouver, as the site for a provincial university, and granted two million acres of public lands for its endowment. Plans have been made for about thirty buildings, including an important group for a college of agriculture, with associated schools of forestry, home economics, and veterinary science.

In Salvador an agricultural school was established in the Episcopal Palace, at Sensuntepeque; and in Mexico one of the functions of the newly constituted agricultural boards will be to establish agricultural schools.

EDUCATIONAL CONVENTIONS. A new national association of agricultural educators known as the American Association for the Advancement of Agricultural Teaching was formed in Chicago, April 10, 1911, and held its second meeting at Columbus, Ohio, November 14. Many other associations gave prominent place in their pro-

grammes to agricultural education. Among the more important of these associations were the following: The Association of American Agricultural Colleges and Experiment Stations, the National Education Association, the Southern Educational Association, the Conference for Education in the South, the Farmers' National Congress, the National Dairy Show, the International Live Stock Exposition and the National Corn Exposition. State associations of agricultural educators held meetings in California, Illinois, Michigan, Minnesota, Nebraska, Ohio, Wisconsin, and other States.

UNITED STATES OFFICE OF EXPERIMENT STATIONS. This office continued to represent the United States Department of Agriculture in its relations with agricultural colleges and schools. It compiled and published the official statistics and the annual organization lists of the State agricultural colleges and experiment stations, annual reports of progress in agricultural education and farmers' institutes, and a monthly chapter on agricultural education in the *Experiment Station Record*. In addition to these regular current publications the office issued the following educational publications: Bulletins—Legislation Relating to Farmers' Institutes in the United States and on County Schools of Agriculture in Wisconsin; Farmers' Bulletin on Forestry in Nature Study; circulars—A Secondary Course in Animal Production, The American System of Agricultural Education, Agricultural Fair Associations and their Utilization in Agricultural Education and Improvement; Year Book separate—Community Work in the Rural High School.

UNITED STATES BUREAU OF EDUCATION. Statistics of the land-grant colleges were compiled and published, a specialist in agricultural education was appointed, and studies of the work of agricultural colleges and schools begun. Among the publications of the bureau was a bulletin on Opportunities for Graduate Study in Agriculture in the United States.

GRADUATE SCHOOL OF AGRICULTURE. Announcement was made of the selection of Dr. A. C. True, of the United States Office of Experiment Stations, as dean of the fifth session of the Graduate School of Agriculture, to be held under the auspices of the Association of American Agricultural Colleges and Experiment Stations at the Michigan Agricultural College, East Lansing, Mich., in July, 1912.

THE AGRICULTURAL COLLEGES. A prosperous year was enjoyed by the agricultural colleges and nearly all of them opened the school year 1911 with largely increased enrollment in regular four-year courses. Among the new buildings completed during the year were a \$200,000 agricultural building for the college of agriculture of the University of California, dairy buildings at the Delaware, New Hampshire, South Dakota, and Wisconsin colleges, a poultry hospital at the Rhode Island College, barns, greenhouses, and a forest-products building at the University of Wisconsin, and a women's building and a large boys' dormitory at the Oklahoma college.

The appropriations made by the State legislatures for the support of the agricultural colleges during the 1911-12 biennium, include some of the most liberal provisions ever made for the maintenance and improvement of educational institutions. The University of Illinois received \$3,800,000, of which \$952,300 was for the agricultural college and experiment station. The

Kansas college and station received \$985,000; the University of Minnesota, \$1,283,900, including \$399,700 for the school of agriculture at University Farm, and \$89,200 for the school of agriculture at Crookston; the Montana college and station, \$274,295; the Oregon college and station, \$681,500; the Washington college and station, \$485,000, and the Colorado college, \$200,000.

Marked progress was made by the colleges in developing facilities for the training of teachers of agriculture for the elementary and secondary schools. At least forty-six of the agricultural colleges maintained teacher-training courses in agriculture, and these courses varied from summer courses of a few weeks to regular four-year courses, with additional graduate work. Four-year courses for teachers were offered by twenty-two colleges; three-year courses by six institutions; two-year courses by nine institutions; and one-year courses by six of them. Twenty-nine of the colleges provided summer schools of agriculture for teachers, five coöperated with other agencies in the training of teachers, and seven conducted correspondence courses for teachers.

EDUCATIONAL EXTENSION WORK IN AGRICULTURE. In forty-three States there were directors in charge of extension work. In twenty-seven States 109 men gave all their time to extension work and in twenty-nine States 256 men gave part time to this work. Among the largest extension staffs were Iowa seventeen, Kansas sixteen, Ohio twelve, Massachusetts eight, Minnesota seven, and Utah five. The States giving the largest appropriations for extension work were Iowa and New York, \$50,000 each, Indiana \$49,200, Minnesota \$42,000, Ohio and Wisconsin \$40,000 each, Kansas \$35,000, Georgia \$30,000, Massachusetts \$20,000, Illinois \$19,900, and Nebraska \$17,500. When it is remembered that only six years ago there were scarcely a half-dozen institutions in the entire country having organized systems of extension work in agriculture, the present important position it occupies in the field of agricultural education is remarkable.

Farmers' institutes were held in all of the States and Territories excepting Alaska, Hawaii, Nevada, and Porto Rico. There were 5889 institute meetings, comprising 16,741 half-day sessions. The attendance at these meetings was about 2,292,000. The appropriations for this work from all sources was \$432,700.

Movable schools of agriculture were held in fourteen States to the number of 168, averaging about four days each and attended by 48,000 persons.

Twenty-eight States ran seventy-one educational trains over 40,000 miles of railroad and reached 995,000 people. There were also many special institutes, independent institutes, agricultural meetings at fairs and picnics, and other like meetings, which brought the aggregate attendance at institutes of all kinds up to 3,615,000.

SECONDARY AND ELEMENTARY SCHOOLS. The most notable development in agricultural education in the United States in 1911 was in the large number of high schools that added courses in agriculture to their curricula. From 630 secondary schools reporting students in agriculture in 1910 the number increased to about 2000 in 1911. In the case of over 200 high schools receiving for the first time State aid for the teaching of agriculture, the addition of

this course involved the employment of a special teacher of agriculture and the purchase of considerable laboratory apparatus and other special equipment. The following States gave bonuses for high school agriculture for the first time or increased the number of schools receiving bonuses: Kansas, \$250 to each of 100 schools; Maine, to any free high school or incorporated academy a sum equal to two-thirds of the local expenditures for the course, not to exceed \$500 to one school; Massachusetts, to any public high school a sum equal to two-thirds the salary paid to instructors in agriculture; Minnesota, increasing the number of schools receiving \$2500 for courses in agriculture, home economics, and manual training from 10 to 30, and providing a \$1,000 bonus to each of fifty schools maintaining courses in agriculture and either home economics or manual training; North Dakota, \$2500 a year to each of five schools meeting State requirements as to the teaching of agriculture, home economics, and manual training; Texas, \$500 to \$1500 to any high school maintaining an approved course in agriculture, aid to be given not more than twice to the same school; Wisconsin, \$250 to any free high school maintaining an approved course in agriculture.

A new State school of agriculture was established at Randolph, Vt., and four district agricultural schools supported by the State were opened in Arkansas.

The legislature of North Carolina passed a law for a "County Farm-Life School" in each of ten counties in the State. These schools must not be in any city or town of more than 1000 inhabitants nor within two miles of a city of more than 5000. Schools meeting all other State requirements and having local funds for maintenance amounting to \$2500 may receive \$2500 from the State.

The teaching of agriculture in elementary schools was promoted in many ways. Ohio passed a law requiring the teaching of agriculture in all elementary schools and rural high schools. New York and Oregon inaugurated systems of rural school supervision to aid the introduction of this subject. State rural school supervisors in nearly all of the Southern States lent similar aid in that section of the country.

Boys' and girls' agricultural clubs increased rapidly in number and in membership. The boys' corn clubs in the South enrolled over 55,000 members. There were also in that section 1400 members of boys' cotton clubs and 500 members of girls' garden and canning clubs. Twenty winners of State prizes in the corn contests were given free trips to Washington in December. A Mississippi lad who raised 227 1-16 bushels of corn on one acre at a cost of 14 cents per bushel won the sweepstakes prize.

There were also many members of agricultural and home economics clubs in the other States. Massachusetts had 10,000 members of potato clubs. In Oregon there were truck-gardening clubs; in California, garden city clubs, and tree growing clubs; in Texas and Louisiana, hog clubs; in Nebraska, agricultural and home improvement clubs, and so on through a long list of enterprises intended to educate boys and girls and give them experience in rural affairs.

TEXT-BOOKS AND MANUALS. Many text-books and manuals suitable for use in agricultural courses were published. The most important of those issued in 1910 and 1911 are classified below.

RURAL ECONOMICS: L. H. Bailey, *The Coun-*

try Life Movement (1911); J. A. Bexell, *Farm Accounting and Business Methods* (1911); G. Pinchot, *The Fight for Conservation* (1910); T. G. Thomas, *First Aid to Shipping Fruits, Vegetables, Butter, Eggs, and Game for Profit to Market* (1910); C. R. Van Hise, *The Conservation of Natural Resources in the United States* (1910); G. F. Warren and K. C. Livermore, *Laboratory Exercises in Farm Management* (1910).

AGRONOMY: C. W. Burkett, *Farm Crops* (1910); P. B. Crane, *Quack Grass Eradication* (1910); J. F. Duggar, *Southern Field Crops* (1911); P. G. Holden, *Corn Secrets* (1910); C. G. Hopkins, *The Story of the Soil* (1911); C. G. Hopkins, *Soil Fertility and Permanent Agriculture* (1910); C. G. Hopkins and J. H. Pettit, *Soil Fertility Laboratory Manual* (1910); A. A. Houghton, *Practical Silo Construction* (1911); P. McConnell, *The Complete Farmer* (1910); E. E. Miller, *Fertilizing for Profit* (1910); L. H. Pammel, *Weeds of the Farm and Garden* (1911); T. Shaw, *Weeds and How to Eradicate Them* (1911); J. A. Widsote, *Dry Farming: A System of Agriculture for Countries under Low Rainfall* (1911).

AGRICULTURAL EXPERIMENT STATIONS. EXTENSION OF THE WORK. Better financial conditions resulting from increased federal funds under the Adams act of 1900, and other resources, as well as growing interest in progressive agriculture, have continued to strengthen the stations. Special provision for the more practical experiments to meet local conditions is being made on a broader scale. In California the university and station have come into possession of the farm of 5400 acres bequeathed to Mr. M. T. Kearney near Fresno, and valued at \$1,000,000. This will afford unusual facilities for experiments required for the San Joaquin Valley. In Idaho branch stations are conducted at Clagstone, Caldwell, and Gooding. Minnesota has given the station about \$20,000 for field and demonstration work in various lines. This is in addition to \$50,000 for the biennium for extension and demonstration work, including the operation of twenty demonstration farms. North Dakota has five sub-stations and twenty-four demonstration farms. Seven new sub-stations have been located in Texas. The Washington station has appropriations of \$20,000 for extension work and dry farming. The Wisconsin station has twenty-five county and asylum farms under its management. Ohio has provided for county demonstration farms on petition of taxpayers.

In 1910 the stations employed 1403 persons in the work of administration and inquiry, as compared with 1100 in 1907. They published 583 annual reports, bulletins, and circulars, which were supplied to over 952,000 addresses on the regular mailing lists. The correspondence with farmers is enormous and constantly increasing. The value of the additions to station equipment in 1910 aggregated \$938,750.

FEDERAL AND STATE STATIONS. Agricultural experiment stations maintained in whole or in part by federal funds now exist in every State and Territory, including Alaska, Hawaii, Porto Rico, and Guam. There are also stations in the Philippines under the insular government. More than \$1,000,000 has been added to the annual income of the stations within the past three years. The total amount expended for stations maintained under the acts of 1887 (Hatch) and 1906 (Adams) during the fiscal year ended June 30, 1910, was \$3,537,700.25, of which \$1,344,000 was received from the national government. In addition to this, the Office of Experiment Stations had an appropriation of \$349,220, including \$28,000 each for the Alaska, Hawaii, and Porto

Rico stations; \$15,000 for the Guam station, \$10,000 for nutrition investigations; \$75,000 for irrigation investigations; \$81,160 for drainage investigations, and \$10,000 for farmers' institutes and agricultural schools.

In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York, North Carolina, and Virginia, separate stations are maintained wholly or in part by State funds and in a number of States sub-stations are maintained. Excluding sub-stations the total number of stations in the United States is sixty-two, of which fifty-five receive federal funds.

OFFICE OF EXPERIMENT STATIONS. An annual inspection of the stations is made by the office and much advice and assistance is given them in a great variety of ways. About 350 projects are being conducted by the stations under the Adams act, many of which deal with fundamental problems in agricultural science. The review of the world's literature of agricultural science in the *Experiment Station Record* has been further enlarged. Two volumes of this journal are now issued annually, containing over 7000 abstracts. The 24 volumes thus far issued contain references to 85,829 articles, besides editorials, special articles, and notes. The card index of the literature of the American stations issued by this office now contains about 32,000 cards and is being widely used by students. Copies of this index are deposited in the libraries of the agricultural colleges, experiment stations, and State departments of agriculture. The special investigations in charge of this office, for which its income in 1911 aggregates \$330,000, are in five main lines: (1) Maintenance of experiment stations in Alaska, Hawaii, Porto Rico, and Guam; (2) agricultural education (q. v.); (3) food and nutrition (q. v.); (4) irrigation (q. v.); and (5) drainage (q. v.). See also AGRICULTURAL EDUCATION.

RECENT EXPERIMENTS. The study of problems relating to dry farming has been an important feature of the stations' work in recent years and has included crops, methods of culture, relations of water to plant growth and health, breeding of drouth-resisting varieties, etc.

Irrigation experiments at many places have shown that more healthy and productive plants can be grown by carefully limiting the amounts of water used and applying them at the right time. The Wisconsin Station is distributing pedigreed barleys and oats, improved tobacco seed, and new varieties of plums and apples. The South Dakota station has developed excellent hybrid raspberries, plums, and crosses of the plum with the sand-cherry and the Chinese apricot. The North Dakota station has been especially successful in breeding alfalfa, corn, and winter wheat and rye. A variety of winter wheat and three varieties of oats originated at the Minnesota station have outyielded ordinary varieties by fifteen to twenty-five per cent. Pedigreed strains of corn, oats, wheat, and soy beans developed by the Ohio station have yielded from two to fourteen bushels more per acre than the original stock. The hybrid wheats originated by the Washington station resulted in 1910 in an increase of 1,500,000 bushels in the wheat production of that State. The studies of soil bacteria at Western stations have shown the great importance of bacterial activity in relation to the formation of nitrates in that region and the great desirability of adapting cultural methods to the requirements of beneficial bac-

terial activity. The New Jersey station has worked out a bacteriological method of determining the availability of nitrogenous fertilizers which promises to be of great practical value. The Nebraska station has demonstrated that when corn is above thirty-five cents per bushel and alfalfa not over seven dollars a ton, the old method of fattening cattle by feeding heavily with grain and using little roughage is much less profitable than a moderate use of grain with more roughage. The Tennessee station has worked out a system for growing two crops on the land annually, thus maintaining a steer for every acre.

Several stations have shown that heavy feeding of silage—up to over forty pounds a day—can be followed with advantage in fattening cattle. The Iowa station has designed a silo built of hollow tile, reinforced between courses of blocks, which is proving very efficient and cheaper than concrete when sand and gravel have to be shipped in.

At the Missouri station studies on the dormant periods of plants have shown that hard freezing or severe drouth will force the development of buds and that anything which will delay ripening will cause a prolonged resting period. Late growth due to fertilizing and cultivation has resulted in heavy crops of fruit, whereas frosts destroyed those in orchards which were permitted to mature in a normal manner.

After experiments running fifteen years the New York State station has concluded that commercial fertilizers are of little benefit to young apple orchards growing on soils naturally suited to apple culture, provided the orchards are well tilled and properly supplied with organic matter from stable manure or cover crops.

In the Eastern States the work of the stations continues to indicate the advisability and practicability of growing alfalfa in many sections.

In Alaska the efforts to grow barley and oats at the Rampart station have been uniformly successful and a number of good crosses of varieties of barley have been made. At the Fairbanks station several hundred bushels of potatoes were produced. At the Kodiak Station eighty-two head of Galloway cattle, ten grade cattle, and eighty-nine sheep were successfully wintered on native forage supplemented by a small amount of purchased grain. At Sitka the work with hybrid strawberries has been continued with marked success.

In Hawaii the experiments with Sea Island and Caravonica cotton continue to attract favorable attention and the profitability of this new agricultural industry has apparently been demonstrated. The Japanese rice imported by the station have been successfully grown. It has been found that pineapples can be grown in Hawaii with less rainfall than was formerly thought necessary, but the lack of drainage and sometimes too much manganese in the soil are the chief hindrances to this crop. Two demonstration farms have been established on Hawaii and one on Kauai. A sub-station has been begun in the Nahiku rubber district in Maui to study problems relating to Ceara rubber, awa (*Piper methysticum*), broom corn, and tobacco.

In Porto Rico some three-year-old trees of the introduced varieties have borne at the rate of 800 pounds merchantable coffee per acre as compared with the island's average of 200 pounds. More than forty varieties of mangoes

have been introduced from various tropical countries.

In Guam experiments have already demonstrated the superior value of Para grass, Guinea grass, and several non-saccharine sorghums. The pigeon pea, jack bean, and peanut are promising well. The Smooth Cayenne pineapple has been introduced from Hawaii. Six Morgan horses, five Ayrshire cattle, four Berkshire hogs, and some poultry have been introduced for experimental purposes. Secretary Wilson has recommended the establishment of a station on Tutuila in the Samoan group, where the copra industry is threatened by the coconut beetle.

In England a station has been established at Burbage, Leicestershire, for applying Mendelian methods of research to the practical breeding problems of agronomy, horticulture, and forestry. In Canada additional experimental farms have been located at Cap Rouge near Quebec and at Ste. Anne de la Pocatière in Kamouraska county, Quebec. In Spain a station has been established at Burgos and œnological station at Aranda de Duero, Felanitx (Balears Province), and Valdepeñas.

Germany now has seventy-two stations, employing 1378 persons and having a total income of about \$1,450,000.

AGRICULTURAL EXPORTS. See AGRICULTURE.

AGRICULTURAL EXTENSION. See AGRICULTURE.

AGRICULTURAL LEGISLATION. FEDERAL LEGISLATION. Aside from the annual appropriation act for the support of the Department of Agriculture, the most important measure enacted by Congress was that popularly known as the Appalachian Forest Reserve act. This act was approved March 1, 1911, after a contest extending over several years. Under its provisions \$200,000 may be expended in cooperation with the States in protecting from fire the forested watersheds of navigable streams irrespective of ownership. It also appropriates \$2,000,000 annually until July 1, 1915, for the purchase of lands located at the headwaters of navigable streams and their subsequent maintenance as national forests. This legislation, although general in its terms, was enacted with special reference to conserving the forests and water supply in the White Mountains and the Southern Appalachian System, and it is expected that operations will for the present be confined largely to these regions. The States chiefly concerned for the most part accepted the provisions of the act during the year.

No other measures of direct agricultural interest were enacted except the Canadian Reciprocity measure (see **TARIFF**), which was rendered ineffective by its failure to receive ratification by Canada, but an unusual number of matters were pending at the close of the year. One of the most important of these contemplated national legislation to keep out new and dangerous insect pests and plant diseases now frequently introduced with imported nursery stock. A number of other bills would provide federal appropriations aggregating over \$12,000,000 per annum to the States for instruction in agriculture, the trades and industries, and home economics in secondary schools and normal schools, for extension work in these subjects by the colleges of agriculture and mechanic arts, for collegiate work in forestry, for research work in home economics, and for branch experiment

stations. There were also being advocated the undertaking by the federal government of the actual construction of public roads and land drainage projects, the amendment of the Food and Drugs act, the oleomargarine laws, and the meat inspection act, the inspection of imported seeds, the establishment of a rural parcels-post system, the leasing of grazing privileges on the public lands, the restriction of speculation in farm products, and many other projects of a special or local nature.

STATE LEGISLATION. The quantity of State legislation pertaining to agriculture was considerable and much of it was of general significance. Control measures of foods, feeding stuffs, fertilizers, seeds, and other agricultural commodities were especially in evidence.

New pure food laws were adopted in Florida, Idaho, Indiana, Iowa, Maine, Montana, Texas, and Wyoming, the action of Montana reducing the States without effective machinery to three—Arkansas, Mississippi, and West Virginia. Many other States amended their laws, some to bring about closer conformity with the federal Food and Drugs act, and others in the direction of greater stringency, as by requiring the net weights of all packages to be declared, and regulating the sale of cold-storage products. Maine provided for the inspection of its canned goods, and Florida forbade the sale of green or otherwise unfit fruit. Laws regulating the sanitary conditions under which food products are produced and sold were strengthened in Idaho, Illinois, Missouri, Nevada, New Hampshire, New Jersey, Ohio, and Utah.

Pennsylvania and California took a prominent part in the good-roads movement, the former authorizing a system of nearly 300 State roads, and the latter a system to cost not to exceed \$18,000,000. Alabama, Colorado, Connecticut, Delaware, Illinois, Kansas, Missouri, Oklahoma, Washington, West Virginia, and Wisconsin, and other States also enacted roads legislation.

Measures were passed to promote the reclamation of swamp lands in at least sixteen States, most of which authorized the establishment of drainage districts for financing and constructing drainage systems. Amendments of varying importance were made by most of the arid States to their irrigation codes.

A comprehensive campaign against the chestnut-bark disease was begun in Pennsylvania with an initial appropriation of \$275,000. Colorado, Kansas, Massachusetts, Pennsylvania, and Vermont established apiary inspection. California, Colorado, Florida, Vermont, and Wisconsin strengthened their laws as to insect pests, California and Florida enacting insecticide and fungicide inspection laws.

Stallion registration was required in six additional States. Indiana authorized the formation of coöperative associations for the insurance of farm animals, and a number of States made appropriations for the distribution of hog cholera serum.

Agricultural education met with general encouragement, with liberal appropriations in most States for instruction, research, and extension work. Ohio made agriculture a required subject for all non-city schools, and Kansas prescribed examination of its teachers upon it. Idaho and North Carolina instituted a system of rural high schools in which agriculture is taught, and Massachusetts, Maine, and North

Dakota extended additional State aid to certain schools offering agricultural instruction. New York appointed a State advisory board to consider the promotion of agricultural education and the advancement of country life.

FOREIGN LEGISLATION. In Great Britain a bill providing more stringent regulations in the sale of fertilizers, feeding-stuffs, and other commodities intended for agricultural purposes was passed by the House of Lords in December, one of its principal provisions being that for seed inspection. A Scottish small-landholders' bill was enacted similar to that in operation in England since 1907, under which county councils may purchase lands for rental in small tracts to homeseekers.

The various governmental agencies engaged in agricultural work in France were brought together November 1, under a department of agriculture, with bureaus of general administration, agricultural instruction and service, waters and forests, horse-breeding, inspection work, and agricultural credit and other coöperative societies. A phytopathological service was established May 1, for the protection of horticultural interests from insect pests and plant diseases. The fertilizer regulations were revised to include a more comprehensive system of inspection, and new standards promulgated for sugars, confectionery, cocoa products, and other foods. A commission reported a plan for the organization of a complete meteorological service.

Denmark has passed an act amending the law as to the trade in butter and foreign agricultural products. The coloring of butter or use of preservatives is forbidden, and the water content of exported butters limited to sixteen per cent.

A law was passed in Turkey in June, 1911, admitting agricultural machinery and implements free of duty, and extending the same concession to commercial fertilizers.

AGRICULTURE. One of the most notable developments agriculturally since 1907 has been the country-life movement and a more intimate study of the conditions surrounding the farmer and his industry. The movement set on foot in 1908 by the appointment of a commission on Country Life by President Roosevelt, has grown in force with each succeeding year. Along with this have gone the agitation for the conservation of national resources, of which the soil has been pronounced the greatest, and a widespread effort to make the average farmer more efficient, in which the railroads, bankers, and other industrial organizations have participated. The increased cost of food products and the problem of the food supply of the future are also subjects which have sprung into prominence.

The International Institute of Agriculture, at Rome, was organized in 1908, and an agricultural bank opened in the Philippines for the aid of farmers. Land expositions are a development of the last three or four years, and are now held annually in several of the large cities. In Great Britain an important measure, known as the Development and Road Improvement Funds acts, was passed in 1909, providing aid for agricultural development along educational and economic lines.

The most important new contribution is the results of the census, giving the figures showing the status of agriculture in 1910.

CENSUS OF AGRICULTURE IN THE UNITED STATES. The preliminary results for agriculture of the Thirteenth Decennial Census were issued in September. These showed that there were in 1910 in continental United States, 6,340,357 farms, as compared with 5,737,372 in 1900, an increase of 10.5 per cent. These represented a total acreage of 873,729,000, of which 477,448,000 acres were improved land, an increase of 15.2 per cent in the latter in the decade. The improved land constituted fifty-five per cent of the total in 1910, and forty-nine per cent in 1900. The size of the average farm was 138 acres in 1910 and 146 in 1900.

The increase in population in the decade was twenty-one per cent, which the number of farms did not keep pace with, the increase being only 10.5 per cent. This is the lowest rate of increase noted since the number of farms was first recorded in 1850. In large areas of the country the number has remained practically stationary. Nor is the low rate of increase compensated by any growth in the size of farms, as shown above. Improved land, however, increased more rapidly than the total farm acreage, showing an advance of 15.2 per cent, but this was only about two-thirds of the growth of population, so that at the best the number of acres under cultivation did not keep pace with the increase in the number of people.

In striking contrast with the above is the enormous rise in the value of farm property. Farm land, exclusive of buildings, which was valued at \$13,058,008,000 in 1900, had more than doubled, being returned in 1910 at \$28,386,770,000. This represents an increased value of \$15,328,762,000 or 117.4 per cent. The average value of farm land per acre increased from \$15.57 in 1900 to \$32.49 in 1910, a gain of 108.7 per cent. This increased value is attributed in part to the advancing prices of agricultural products which have increased the income-producing power of farm lands. Another important factor is the cost which has been involved in improving 62,949,000 acres of what was previously unimproved land. The fact that desirable free land has practically disappeared, and that there has been increased demand for homes in the country and a growing appreciation of the importance of land ownership, has also affected prices. The value of farm buildings likewise showed a large increase—from \$3,556,640,000 in 1900 to \$6,294,737,000 in 1910, or a gain of seventy-seven per cent. The value of the implements and machinery on farms increased from \$749,776,000 in 1900 to \$1,262,022,000 in 1910, or 68.3 per cent.

Of the total number of farms 85.5 per cent. were operated by white farmers and the remaining 14.5 by negro and other non-white farmers. The latter showed an increase of about one per cent, the number in 1910 aggregating nearly a million farms.

Taking the country as a whole, there was relatively little falling off in the farms operated by owners, and less than in the preceding ten years. The total number in 1910 was 3,933,705, or sixty-two per cent, as compared with 3,653,323, or 63.7 per cent, in 1900; whereas the number of tenant farmers was 2,340,254 as against 2,024,964 in 1900. The farms conducted by managers amounted to one per cent. at both censuses.

There has been a relative increase in the number of mortgaged farms, but the increase in the

proportion of mortgaged farms from 1900 to 1910, was less than in the previous decade.

The expenditure for hired labor on farms amounted to \$645,612,000 in 1910, as compared with \$357,302,000 in 1900, an increase of 80.6 per cent. The expenditure for fertilizers more than doubled, being \$53,432,000 in 1900 and \$114,277,000 in 1910.

LIVESTOCK. The aggregate value of all livestock in continental United States, including domestic animals, poultry, and bees, as reported April 15, 1910, was in round numbers \$4,895,000,000. This is an increase of 59.2 per cent. since 1900. These figures do not include livestock in cities and towns. The value of the principal classes of domestic animals on farms was as follows: Horses and colts \$2,076,000,000, cattle \$1,485,000,000, mules and mule colts \$522,000,000, swine \$398,000,000, sheep and lambs \$231,000,000, and poultry \$153,000,000.

In 1900 cattle constituted 48 per cent. of the value of all farm livestock, far exceeding any other class; but in 1910 horses had taken first place, forming 42.4 per cent, with cattle 30.3 per cent, mules 10.7 per cent., and swine 8.1 per cent., while sheep and lambs made up less than 5 per cent. of the total value. The two classes of horses and mules together now constitute over half the total value of livestock on farms and ranges. The total value of horses increased 131.6 per cent. and of mules 166.2 per cent. since 1900.

It is noted that the figures for cattle are not strictly comparable with those for 1900, as the latter census was taken as of June 1, after all the spring calves were born, while the 1910 census, as of April 15, showed a much smaller number of calves. There were 20,580,845 dairy cows and heifers kept for milk in 1910, having an average value of \$34.24, or a total of \$704,612,120. Of the total number of farms 80.9 per cent reported dairy cows as being kept. The number of horses on farms was returned at 19,731,060, the mature animals having an average value of \$112.53. Mules had a considerably higher average value, \$131.54.

For the country as a whole an increase of \$60,000,000 in the value of sheep was shown, but this is not as great as the relative increase for other classes. Sheep were kept on less than 10 per cent. of the farms. Swine showed a gain in total value of 71.6 per cent. and poultry of 78.9 per cent. The latter now has a value of \$153,394,142 for the United States, while bees represent an investment of a little over \$10,000,000, showing practically no change.

The number of sheep of shearing age was about $\frac{1}{2}$ per cent. less in 1910 than in 1900. The wool clip in 1909, however, amounted to 289,419,977 lbs. as compared with 276,567,584 lbs. in 1900. This gain was due to an increase of one-half pound in the average weight per fleece, which was 6.8 lbs. in 1909 and 6.3 lbs. in 1900. The total value of wool produced increased from \$45,670,000 in 1900 to \$65,472,000 in 1909, a gain of 43.4 per cent. By far the most important factor in determining this change was the increase in the price of wool from seventeen cents per pound in 1900, to twenty-three cents in 1910. Nearly half (forty-seven per cent) of the wool was produced in 1909 in the mountain division of the United States, and sixteen per cent. in the east-north central division, the Pacific division being third with nearly twelve per cent. The value of the

fleece showed considerable range in different sections. In the east-north-central division it averaged \$2.11 and in the middle Atlantic \$1.98. The high averages came from a high average weight combined with a high value per pound. In the west-north-central division the value averaged \$1.71, in the mountain division \$1.47, and in the Pacific \$1.35. The lowest averages were in the east-south-central, \$1.05, and west-south-central \$1.07, due chiefly to the low weight per fleece.

RURAL POPULATION. The general trend of population toward the cities is very forcibly brought out by the census report upon urban and rural population. For purposes of discussion, urban population is defined as that residing in cities and other incorporated places of 2500 inhabitants or more, and the remainder as rural. Taking continental United States as a whole, 46.3 per cent. of the population is classed as urban and 53.7 per cent. as rural, while in 1900 rural population constituted 59.5 per cent. and in 1890 63.9 per cent. This shows a very considerable decrease in the proportion of rural population, varying greatly for the different sections of the country. The percentage of increase in population in the last decade was 34.9 in urban and only 11.1 in rural territory. The percentage gain in population was, therefore, three times as great in urban as in rural territory. In seven States—New Hampshire, Vermont, Ohio, Indiana, Illinois, Iowa, and Missouri, there was an actual decrease in rural population, while every State showed an increase in urban residents; and in all but two States—Montana and Wyoming—the urban population increased more rapidly than the rural. The largest percentage gains in rural population occurred in the mountain, Pacific, and west-south-central divisions, in the order named.

The census has discussed in a special report the movement of white and negro population in the Southern States. Contrary to the oft-repeated statement that the negroes are moving to the towns and cities more rapidly than the whites, the census figures show that the reverse is the case. The rate of increase for the urban whites advanced from 27.6 per cent. in 1900 to 46.6 per cent. in 1910, or a difference of nineteen per cent., while the rate for the urban negroes advanced from 23.2 to 30.5 per cent., or a difference of 7.2 per cent. It is shown that in many sections the number of farms operated by whites has materially decreased, while the number of colored tenant farmers has largely increased.

AGRICULTURAL IMPLEMENT MANUFACTURE. For the manufacture of farm implements the census shows 640 establishments in the United States, a slight decrease since 1904. These had \$256,281,000 invested in the business, which was a gain of thirty per cent. and they turned out products in 1909 having a total value of \$146,329,000, a gain of thirty-one per cent. over 1904. These included 5,024,637 implements as compared with 3,892,012 in 1904, or twenty-nine per cent. more. In this list implements of cultivation—plows, harrows, cultivators, etc.—lead with a total of 3,287,649, followed by harvesting implements—mowers, rakes, reapers, harvesters, etc.—1,059,482. A very great increase was noted in steam thrashers, from 7950 in 1904 to 23,586 in 1909, or 197 per cent., while the manufacture of horse

thrashers decreased from 2237 to 822, or sixty-three per cent.

The magnitude of this industry is shown by the report of the International Harvester Company, one of the largest manufacturers. The total sales of farm machinery and allied products during 1910 aggregated \$101,106,358, an increase of sixteen per cent. over the sales of 1909. More than one-third of this product is marketed in foreign countries.

CROP PRODUCTION IN THE UNITED STATES. The climatic conditions of the early part of the growing season of 1911 were adverse to agriculture throughout the country east of the Rocky Mountains, to a degree that exceeds all records. It is stated by the Weather Bureau that probably not in the last half century has the temperature been so continuously and largely above the average over so extensive a region as from early May until into July. Deficient rainfall combined with this continuous heat made the severest test to which the crops of the immense area covered have been subjected during the many years for which there are records. But in spite of this, 1911 was not a lean year and many crops made a better showing in total production than was feared. Most crops, however, fell considerably behind the average production of the preceding five years, hay showing the greatest percentage of deficiency. Cotton was the most conspicuous exception to this rule, being estimated at the close of the year as the largest crop ever grown and one-quarter larger than the five-year average. The sugar-beet crop was also the largest ever grown, and was much above the average of the previous five years, while rice and buckwheat were considerably above.

For the first time in many years the total value of farm products declined from that of the preceding year. The estimate for 1911 is based on the census items and is \$8,417,000,000, or \$277,000,000 under the total for 1910, and considerably less than for 1909. The loss in 1911 is chargeable to the decline in prices of general classes of animal products and animals sold and slaughtered. Dairy cows are the only farm animals for which increase of price is indicated. The farm prices of eggs, wool, butter, and poultry have likewise suffered during the year. In consequence of this decline farm animals and their products are estimated as having produced a value of \$2,913,000,000 in 1911, or \$321,000,000 below the amount for 1910.

On the other hand, the crops were worth more than those of 1910, the estimate of farm value being 5,504,000,000, a gain of \$44,000,000 over 1910. Farm prices of all crops were higher than for 1910, except for cotton, cotton seed, flaxseed, and perhaps rice; and this general fact, notwithstanding that production was low, makes about ten crops of 1911 the most valuable ones of the same kinds that the farms of this country have ever produced.

Corn was far ahead of all other crops in value, having twice the value of the cotton crop and nearly the combined values of the cotton, wheat, and oat crops. The estimated production of 2,631,488,000 bushels has been exceeded in but two years, and is a little under the average for the five preceding years. The farm price is higher than it has been since the records of the Department of Agriculture began in 1866, except in 1883, and this gives the crop a value of \$1,565,258,000, breaking all records. About three-fourths of the world's crop was grown in

the United States, and for the past five years the exports have formed about one-third of the world's exports of corn.

Cotton has declined to a price five cents a pound of lint below that of last year, and the seed likewise. Accordingly the value of the fibre and seed of this record crop is below that of two former crops, being estimated at \$775,000,000. The decline in price has led to a vast scheme of financing in the effort to lessen the loss. The Southern Cotton Congress and the conference of governors of the cotton States have arranged with New York bankers to put up \$50,000,000 in the cotton States to enable planters to hold their crop for a possible rise until January 1, 1913, but in accepting this financial help farmers must agree to reduce their acreage the coming year. No crop grown in this country excites such world-wide interest as cotton, for the reason that the United States' product is about three-fifths of the world's supply, constitutes two-thirds of the world's exports, and has a fibre that has no direct competition in other countries. The fibre makes up about one-half of the value of agricultural exports and more than one-fourth of that of all exports from the United States. During the fiscal year 1911 it reached the unprecedented amount of \$585,000,000, or over \$148,000,000 more than the average for the preceding five years.

Hay, with a production of only 47,444,000 tons, far below the five-year average of 63,500,000, is the third crop in value, owing to an increase in farm price of about \$2.50 over 1910. The value of the crop is placed at a little less than \$700,000,000, which is \$50,000,000 more than the estimated value of the cotton lint, and \$150,000,000 more than that of the wheat crop. These comparisons show for the hay crop a value which is not generally recognized off the farm.

The wheat crop, estimated at 621,338,000 bushels, was five and one-half per cent. below the five-year average in amount, and had a value of about \$550,000,000, a little below the average. The United States produced one-fifth of the world's wheat crop during the past five years, and contributed about one-eighth to the world's exports.

The oat crop was, as usual, fifth in order of value, the relatively low production of 922,298,000 bushels being valued at \$414,663,000, or five per cent. more than the five-year average. About one-fourth of the world's crop is grown in this country.

The potato crop, the early prospect for which was an almost complete failure, amounted to 292,737,000 bushels, an amount twelve per cent. below the five-year average. The farm price, however, increased twenty cents a bushel, with the result that the total value was the highest on record, \$233,778,000, or fourteen per cent. above the five-year average.

Barley was also deficient in production, the 160,000,000 bushels being twelve per cent. below the five-year average, but owing to a high farm price of eighty-five cents a bushel it had a total value of \$139,182,000, much above the record value of 1907.

Tobacco production, estimated at about 900,000,000 pounds, was two per cent. under the five-year average, and its value of \$85,000,000 was 5.3 per cent. under the average. The crop grown in this country during the past five years has comprised thirty-one per cent. of the world's

crop, and supplied other countries with 42.3 per cent. of the world's exports.

The flaxseed crop was seven and one-half per cent. under the five-year average, but owing to a price of \$2.17 its value rose above any previous year, being fifty-three per cent. above the five-year average.

Rye also reached its highest value, although the crop was short of the average by 5.4 per cent. The sugar-beet crop was the largest yet produced and reached a value of over \$24,000,000, an increase of twenty-three and one-half per cent. above the average, and much above the previous highest value. A rise in the price of hops, usually ten to twenty cents a pound, to about thirty-eight cents, gave the crop of fifteen per cent. below the average a value of \$15,500,000, or 140 per cent. more than the five-year average. A little over one-fourth of the world's crop is produced in the United States.

Rice was one of the crops above the five-year average, although the production of a little more than a billion pounds has been twice exceeded; but owing to price its value was ten and one-half per cent. below the average, amounting to \$18,300,000. Buckwheat, which has been on the decline for many years, gave a crop 7.3 per cent. above the five-year average, which has been exceeded only twice since the sixties. The farm price was unusually high, about seventy-two cents a bushel, giving the crop the largest value since the sixties.

The crops of the year compare more favorably with the averages of the previous five years than they do with the single years of highest production. The combined production of cereals was 4,522,000,000 bushels, which is 3.4 per cent. below the five-year average, and the fifth in size.

The census figures showed a remarkable falling off in the wheat acreage during the decade, amounting to 8,328,000 acres or fifteen per cent. This decrease was widespread. In California it amounted to eighty-two per cent.—from 2,688,000 acres in 1899 to 483,000 acres in 1909; in Iowa to 68.8 per cent., Minnesota to fifty per cent., and in Ohio to forty-three per cent. The change means to a large extent a shifting from wheat to livestock farming, and has resulted in some cases from bringing about a condition by continuous culture under which wheat became unprofitable. There was a gain in area in ten States, North Dakota leading with eighty-four per cent., and Kansas with fifty-seven per cent., these two States adding 5,896,000 acres to the wheat area. This reflects in large measure the invasion of the dry farming district by the wheat farmer.

FOREIGN TRADE IN AGRICULTURAL PRODUCTS. The large balance of trade in favor of agricultural exports from the United States, which showed a decline in 1909 and 1910, was maintained in 1911. In the fiscal year 1908 this balance in agricultural products was \$488,000,000, in 1909 it was \$274,000,000, and in 1910 it fell to \$198,000,000, while in 1911 it rose to \$366,644,580 on farm products and \$53,976,340 on forest products. In the latter year the balance in favor of non-agricultural exports was \$156,000,000. The balance in the case of both classes of exports is due largely, if not entirely, to raw cotton.

In 1911 the export of farm products totaled \$1,031,000,000, being exceeded only by 1907. There was a gain in packing-house products exported of \$21,000,000 over 1910, amounting to

\$157,000,000; but grain and grain products continued the decline which began in 1909 and fell to a value of \$124,000,000, a loss of \$91,000,000 in three years. Exports of butter have increased steadily for the past two years until they have doubled in volume and value, while in the same period cheese has increased three times in volume. Tobacco exports continued large, amounting to \$39,000,000, or \$1,000,000 above the previous year. The same is true of fruits, with a value of \$24,000,000 or \$5,000,000 over 1910. The exports of live animals have declined to \$19,000,000, which, however, is \$2,000,000 over 1910.

The imports of agricultural products amounted to \$679,000,000, a decrease of about \$8,000,000. The imported silk fibre was valued at \$75,000,000, coffee \$91,000,000, vegetable fibres \$56,000,000, seeds 30,000,000, fruits \$27,000,000—all with increases over the values of 1910.

Declining from the previous year, the imports of wool in 1911 were valued at \$23,000,000, packing-house products, largely hides and skins, \$84,000,000, sugar and molasses \$98,000,000.

The value of exports of domestic forest products continued to advance and the amount for 1911, \$103,000,000, was the highest yet reached. The exported lumber was valued at \$60,000,000, timber and logs at \$17,000,000, and naval stores at \$25,000,000.

The imports of forest products in 1911 were valued at \$164,000,000, and came within \$15,000,000 of equaling the total of 1910, which holds the highest place. India rubber was imported to the value of \$78,000,000, other gums \$26,000,000, lumber \$21,000,000, wood pulp \$14,000,000, an import that has doubled in value in four years.

WORLD'S PRODUCTION OF CROPS. Climatic conditions of the growing season of 1911 were likewise unfavorable in several of the countries of Europe. Western and north-central Europe suffered during late July and the greater part of August from an almost unprecedented drouth, with unusually high temperature in parts. The affected territory comprised England, France, Italy, Belgium, Netherlands, the Scandinavian countries, Germany, Austria, Hungary, and a part of western Russia. In Russia prolonged drouth in western Siberia and the eastern provinces of European Russia resulted in an almost complete failure of cereal and hay crops. The peasants have been forced to dispose of their cattle and poultry at greatly reduced prices, on account of the high prices of feed. In England, France, Germany, and Austria-Hungary especially, the continued drouth was disastrous to the proper development of the autumn-maturing crops, especially sugar beets, potatoes, roots, hay, and all kinds of forage. The Hungarian, Austrian, and French corn crops were irreparably injured, and hops in Austria and Germany were considerably damaged.

The production of cereal crops for the principal countries was as follows:

The following table, prepared by the Bureau of Statistics of the United States Department of Agriculture, shows the average production of the world crops for the five years 1905 to 1909, together with the average percentage of the total grown in the United States for the same period.

AVERAGE WORLD PRODUCTION AND PROPORTION FROM THE UNITED STATES.

	Average	Percentage of total produced in U. S.,
	1905-1909	1905-1909
Wheat (bushels)....	3,008,000,000	20.7
Corn (bushels).....	3,556,000,000	76.8
Oats (bushels).....	3,695,000,000	24.2
Barley (bushels)....	1,298,000,000	12.4
Rye (bushels).....	1,558,000,000	2.0
Flaxseed (bushels)..	100,000,000	26.3
Potatoes (bushels)..	5,194,000,000	5.8
Sugar (tons).....	14,367,000	5.0
Rice (pounds).....	114,096,000,000	0.4
Cotton (bales).....	19,729,000	59.0
Hops (pounds).....	183,000,000	25.8
Coffee (pounds).....	2,541,000,000	...

The world production of leading textile fibres is given by the United States Census for the year 1909 as follows:

Cotton	8,505,191,000 lbs.
Wool	2,695,622,000 "
Silk	85,048,000 "
Flax	1,872,127,000 "
Hemp	1,453,186,000 "
Jute	2,918,000,000 "

Of the cotton the United States produced 60.6 per cent., of wool 12.2 per cent., of flax 0.2 per cent., and of hemp 0.7 per cent. of the total.

FOREIGN STATISTICS. Recent statistics gathered in Canada show the rapid expansion of its agricultural industry. The area in crops in 1891, was 15,662,811 acres; in 1901 it was 19,763,740 acres, an increase of twenty-six per cent, and in 1910 it was 32,711,062 acres, an increase of sixty-five per cent over 1901. This has been largely in the prairie provinces. The crop area increased in Manitoba from 2,756,106 acres in 1901 to 5,318,989 acres in 1910; the combined area in field crops in Saskatchewan, Assiniboia, and Alberta was 844,013 acres in 1901, while in 1910 it had reached 7,430,560 acres in Saskatchewan and 1,808,719 in Alberta. In 1910, the production of wheat in Saskatchewan was 81,139,000 bushel, of oats, 61,367,000, and of barley 3,598,000 bushel.

In 1891 the product of the creameries, cheese, and condensed milk factories of Canada was valued at \$10,780,000, in 1901 at \$29,731,922, and in 1907 at \$35,457,543. Of the fruit grown in Canada 75 per cent. is produced in Ontario.

A recent survey of statistics for agriculture in Great Britain shows that in the past twenty years, ending in 1910, there has been a decrease of about one and one-half million acres of land under arable cultivation, which is only partially compensated by laying down a million acres in grass, leaving a decrease of fully a half million acres in agriculture. Agricultural returns for Great Britain, collected in June, 1911, showed a further reduction of the cultivated area by over 51,000 acres, arable land having decreased by 20,786 acres and permanent pastures by 30,486 acres.

The total number of agricultural holdings of more than one acre in Great Britain in 1910 was 509,808, which was an increase of 637 over 1909. Notwithstanding, there was a reduction in the farmed area.

Within the last twenty-five years 1795 farms

Union of South Africa.....	2,500,000	3,500,000
Australia.....	93,263,000	75,880,000	132,000	2,513,000
New Zealand.....	8,934,000	100,000	1,845,000

of over 300 acres have disappeared in the United Kingdom, 349 of these since 1905. The large farm of several hundred acres is gradually losing its position, and now constitutes little more than three per cent. of the agricultural holdings. During 1910 applications for land under the Small Holdings' act were received from 4003 individuals and seven associations for an aggregate of 70,253 acres, bringing the total number of applicants since the act came into operation up to 30,886 individuals and thirty-four associations, and the total area of land applied for up to 507,377 acres. While the demand is therefore large and considerable progress is being made in providing small holdings in England and Wales, the net increase in the number of small holdings is kept down by the annual transfer of a substantial area of land from agriculture to other purposes. It is officially estimated that in the eighteen years from 1890 to 1908, the reduction in the number of small holdings amounted to 22,000; in the two years, 1909 and 1910, 1026 were added, showing a counteracting influence to the previous tendency.

The acreage of grain crops in Great Britain, as shown by official estimates, has been maintained, and fruit culture has extended very markedly. The returns for livestock in June, 1911, showed the following totals: Horses 1,627,393, cattle 7,114,264, including 2,825,049 cows, sheep 26,404,992, and pigs 2,822,154. Cattle increased somewhat in numbers, cows and heifers more largely than other classes, but the increase did not keep pace with the growth of population. A failure is noted of the milking herd of the country to keep pace with the steadily increasing demand for milk. Sheep, pigs, and horses did not greatly change.

The recent census in Great Britain also shows that people are flocking to the cities, as in the United States, although not quite so generally. An English paper says: "The British rural population does not increase as it should for two main reasons—the lowness of wages and the scarcity of housing accommodations. The former is undoubtedly due to our antiquated fiscal system, which admits foreign produce free but taxes heavily the British means of production." Germany and France also complain that too many of the young people of the farms hurry to the cities.

In Denmark much attention has been given for some time to the encouragement of small holdings to keep farmers and laborers on the land. The state provides for loans to societies having for their object the purchase and division of large tracts for small holdings, and to agricultural laborers desiring to purchase small holdings—two and one-half acres or more. For these loans the budget provides annually over \$1,250,000. During the ten years, 1900-1910, 5092 small farms were established under this law. The large majority of small holders continue to retain their character as agricultural laborers, working out on the average 155 days in the year.

A recent monograph on Belgian agriculture from 1885 to 1910 gives statistics showing the increase in value of farm lands in that country. This increase ranges from 7 per cent. to over 66 per cent. in the case of ordinary arable and prairie lands, and amounts to 300 per cent. for heath lands, in twenty-five years. The latter fact is due in great measure to experiments

made during the past few years through government aid in the profitable cultivation of heath lands, whereby some of the area formerly used for grazing cattle and sheep is being brought under cultivation. Although the value of heath land for agricultural purposes does not at present compare with that of other classes of land, being by far the cheapest in Belgium, it is beginning to have an agricultural value, which may be greatly increased by reclamation and utilization for crop production.

The cause of the increased land values is attributed largely to the increase in crop production, as a result of better farming methods, said to range from 10 to 50 per cent. or more, thus giving more profitable returns from the land and warranting a higher capitalization.

A census of livestock in the Netherlands, taken in 1910, gives 2,026,943 cattle, 54.6 per cent. of which are milch cows, an increase of 20 per cent. in the total number since 1904. The improvement through careful breeding and other means makes the increased value much higher than this amount. A moderate estimate places their total value at \$112,560,000. The average number of cattle to each 100 hectares (247 acres) of farm and pasture land is ninety-four. There has been remarkable development in poultry raising since 1904. In 1906 more eggs were imported than were exported, but in 1910 the exports exceeded the imports by 14,000,000 pounds.

The latest official report places the number of sheep in European and Asiatic Russia, including western Siberia, at 60,000,000 head. There has been a steady falling off in the production of wool, particularly of fine wools, which appeared at one time to be advancing. This is attributed to the evolutionary condition of farm life now going on in some parts of the country. Large estates which formerly pastured hundreds of thousands of sheep are now being cut up into smaller farms, and high rents have also had an influence.

The latest returns for the sheep industry in New Zealand, the most important industry in that country, showed (1910) a total of 24,269,620 sheep. In 1909 the total production of wool was estimated at 192,822,000 pounds, of which 187,619,000 pounds was exported. The export of wool in 1910 was valued at \$40,378,873, as against \$30,646,616 in 1909, and of frozen, preserved, and cured meat (chiefly mutton and lamb) at \$19,560,684.

ECONOMICS OF PRODUCTION. The cost of producing crops has been under investigation and has furnished important data. The Bureau of Statistics in the United States Department of Agriculture has collected figures from thousands of farmers distributed over the country, and has published the results for corn, wheat, oats, barley, and potatoes. The data are for the year 1909, and are based on reports from 6000 correspondents in the case of corn, 5000 in the case of wheat and oats, 4000 in the case of potatoes, and 200 in the case of barley. For corn, the cost of production, exclusive of rent, ranged from about 21 cents per bushel in the Mississippi Valley to nearly 44 cents in the South Atlantic States, averaging 26.3 cents, for the whole country; while when rent or interest on investment was allowed for, it ranged from about 33 cents in the Mississippi Valley to 56 cents in the South Atlantic States, averag-

ing nearly 38 cents. The average farm value per bushel was 62 cents.

For wheat the cost exclusive of rent ranged from 36 cents in the far Western States to 66 cents in the South Atlantic States, and averaged 46 cents. The figures including rent varied from 52 to 85 cents, and averaged 66 cents per bushel. The average farm value was 96 cents. The cost of producing oats, exclusive of rent, ranged from 18 cents in the Mississippi Valley to 33 cents in the South Atlantic States, and averaged 20 cents for the whole country. Allowing for rent or interest it ranged from 29 to 44 cents, and averaged 31 cents per bushel. The average farm value was 40 cents. Barley production averaged in cost nearly 25 cents for the country as a whole, exclusive of rent, or 36.4 cents when rent was allowed for. Its average farm value was 52.1 cents.

In the case of potatoes the cost, without rent, varied from about 18 cents in the North Central States to 25.8 cents in the South Central, and averaged 21.2 cents for the United States, while including rent the range was from 21.4 cents in the North Central to 30.4 in the South Central, the average being 24.6 cents. The average farm value for the whole country was 53 cents per bushel.

It is stated that the above figures are for the better class of farmers.

The Nebraska Experiment Station has found as the average of two years that the cost of producing a bushel of corn on the better farms was 29.6 cents, wheat 54.9 cents, oats 32.5 cents per bushel; wild hay \$5.37 a ton, clover \$4.18 and alfalfa \$3.10.

In Minnesota the cost of producing milk, estimated from careful studies based on record keeping in three localities, as recently published by the Bureau of Statistics, was \$1.11 per cwt. in 1905, \$1.22 in 1906, \$1.31 in 1907, \$1.27½ in 1908, and \$1.25 in 1909. The cost of producing butter fat ranged from 29.3 cents per pound in 1905 to 34.3 cents in 1909. "The data accumulated show very clearly that under average farm conditions the cost of milk and butter fat production is high and that, based upon cost alone, the income from products sold is not sufficiently high to cover cost of production." However, it is shown that "the dairy enterprise has aided materially in making the farm business as a whole more profitable."

The farmers have profited by the higher prices of agricultural products in recent years, but a large share—often held to be an unreasonably large share—goes to the handlers and distributors who do not manufacture the product in any way and take little risk compared to what the farmer bears from seed time to harvest. Feeling has been especially strong against commission men, the methods of some of whom have often been exposed as dishonest and unscrupulous, and legislation has been sought to regulate their business so as to protect the producer and the public. The methods of distribution through the retail trade are also shown to be uneconomical. Cooperation and direct selling are urged as the means of securing to the producer a more equitable share of the price paid by the consumer, or of dividing profits with the latter, and while each year records some progress in this direction, the rank and file of producers are unorganized and

forced to sell through established channels of trade. The high prices of foodstuffs offer a strong argument for reform in the methods of distribution, from both the farmer's and the consumer's standpoint. As the Secretary of Agriculture pertinently asks: "The consumer pays a dollar for food; the farmer gets less than 50 cents for it; who gets the rest?" Those who view the question broadly do not concede that either the supply of gold or the rush of people from the country to the city, or the taking up of public lands, or increased cost of production and prices paid to farmers, are alone adequate to explain the increased retail prices which the consumer is required to pay. The question is a very complex one, in which the increased prices paid to farmers for some products is a relatively small factor.

Agricultural surveys to ascertain the actual conditions which prevail and to take account of stock, have been undertaken by several of the States. One has recently been started in Ohio, beginning with a reconnaissance soil survey and direct work with farmers to ascertain the cost of production under their conditions. An agricultural survey of four townships in Tompkins County, N. Y., showed that for 749 general farms the average capital invested was \$5527, the average receipts \$1146, and the average farm expense \$389, leaving a balance of \$757, representing the earnings of the farmer and his family and the interest on the investment for a year. This is in addition to having a house to live in and such products as the farms furnish. Making allowance for the value of the labor of the farmer and his family, the average net return on the investment was 6.7 per cent. The labor income of 134 farm tenants averaged \$379. The profit made by landlords varied from 2 per cent. or less, up to 20 per cent. or over, but averaged for 135 farms a return of 8.3 per cent. on their capital.

The results of an agricultural survey of four townships in southern New Hampshire, in which various types of farming were represented, have been published by the United States Department of Agriculture in cooperation with the New Hampshire Experiment station. While there were considerable variations, it was found that after deducting 5 per cent. interest on investment the average farmer in the region surveyed received \$337 for a year's work, in addition to shelter and home-grown food for himself and family, or at the rate of \$1.07 a day for 313 working days. The average profit on the investment, after deducting the farmer's labor, was 5.7 per cent.; on general farms it was 5 per cent., and dairy farms 4.27 per cent., on poultry farms 9.39 per cent., and on a small number of fruit farms 23.08 per cent. Still, the particular type of farming was "not so important as the management of the farm." The most successful farmers were found to be "utilizing their land and equipment to much better advantage." In other words, efficiency was the real keynote of success, a conclusion which it is becoming apparent applies to the country as a whole.

The securing of increased efficiency of the farmer in his management and farming operations is receiving much attention from public men, associations, and business organizations, and is looked to as the principal means of increasing production and maintaining the fertility of the lands. That the yields and the returns are often

not what they might be under good farming conditions is attested by the low averages for the staple crops of the country, and that they might with advantage be greatly improved is the consensus of opinion of students of the subject. The bankers' associations have recently taken up the subject. Bankers of the Central West have interested themselves in promoting corn contests, short courses, institutes, and other means to tend to raise the grade of farming. One banker in Illinois has proposed to loan farmers money on approved notes without interest until after the harvest of 1911, for the purchase of fertilizers and lime to be used on wheat land. This movement was the chief topic at the last session of the Illinois Bankers' Association, which passed resolutions advocating federal funds for local field demonstrations for the benefit of farmers, State legislation for agricultural education in the country schools, support of the good roads movement, and the "establishment of country bankers' federations for the development of soil resources." As a result of the efforts of this association a bill has been introduced into Congress providing appropriation for farm demonstrations.

The railroads have for some time been giving attention to improvement in agricultural production, and this movement for local field demonstrators has taken concrete form in the organization the past summer of the National Soil Fertility League, with a working force and an office in Chicago, which is backed by the railroads. This league is conducting an aggressive campaign to create a sentiment for appropriations, State and national, to provide trained demonstrators in each county who shall bring personally and directly to farmers the results of modern farm teaching. Its advisory committee comprises a list of men prominent in agriculture, finance, education, and public affairs, headed by James J. Hill of St. Paul, and includes President Taft, who in his speech at Kansas City clearly stated the object of the organization and gave it his approval. A widespread and aggressive movement has been set on foot, and powerful support has been pledged to it.

The interest in various forms of agricultural extension work, of which the above is a feature, has grown apace, and many of the States now have large operations organized under State appropriation. The Association of American Agricultural Colleges and Experiment Stations at its convention in November strongly urged national legislation for that purpose.

In Canada, the Commission of Conservation has issued an interesting report dealing with its findings during 1910. An agricultural survey was undertaken to ascertain the state of agriculture in the Dominion, representative areas being taken in each province. Taking the whole number of farms, not more than 9 per cent. were found to follow any intelligent and effective system of rotation of crops. In some localities not a single farmer reported any systematic rotation. Lack of this has already shown injurious results; the fibrous material which formerly held the soil in place having been destroyed in one large area of about 500 square miles, leaving it subject to wind erosion. The statement is made as a result of

the survey that the production of field crops from the land now occupied in Canada would be doubled in three years if the farmers on the average would farm as well as the fifty best farmers whose farms were surveyed. It is suggested that one of the best means of promoting that result would be for municipal, provincial, and federal authorities to join in recognizing these best farmers as "illustration farmers," and in holding up the example of their good practice in order that others might follow their systems and methods.

COUNTRY LIFE. Several States are reducing their ideas to workable form and are trying to make substantial progress in defining the real needs of their communities. In the national meeting at the Corn Show in Columbus, early in 1911, where a four-days' rural-life conference was held, and in the Spokane meeting in the fall the countrywide viewpoint on rural needs was presented. The third National Conservation Congress, at Kansas City, emphasized the social as well as the industrial side of agriculture, and gave much consideration to country life conditions and problems.

At the Farmers' National Congress, one of the older agricultural bodies of the country, held at Columbus in October, 1911, Assistant Secretary of Agriculture Hays suggested that the congress be converted into a national country life federation, a federation of farmers and agricultural associations of the various States, with delegates from institutions and national organizations in any way associated with the improvement of conditions of farm living. The proposal was received with favor, and plans are now under consideration. A number of States have formed permanent country life organizations and held conventions, and have launched movements for the solution of their particular problems. A training conference for rural leaders was held at Cornell University during the summer, and a lectureship on Country Life Problems was established in the Wisconsin College of Agriculture, and an expert assigned to study rural conditions in that State, to discover their deficiencies, as a means of starting a movement for improvement.

The report of the Roosevelt Commission on Country Life has been published in book form, with an introduction by Theodore Roosevelt and an explanation by Professor L. H. Bailey, the chairman, since the Congressional report has never been available for popular distribution, and has long been exhausted (New York, 1911). Another book from the pen of Professor Bailey is entitled *The Country Life Movement in the United States* (London and New York, 1911). It explains that this movement is the working out of the desire to make rural civilization as effective and satisfying as any civilization. It is thus to be an end in itself, and not merely a way of raising more food, or of absorbing city undesirables, or increasing the price of land, although all these things happen as secondary consequences.

INTERNATIONAL INSTITUTE OF AGRICULTURE. The third general assembly of the International Institute of Agriculture convened at Rome, in May, 1911, all but two of the forty-eight countries adhering to the institute being repre-

sented by delegates, of whom there was a total of ninety-nine present.

Perhaps the most important action taken related to the form of reporting the conditions of growing crops. The assembly adopted the plan employed in the United States of making definite estimates of the percentage of probable yield as compared with average yield, instead of a much more indefinite statement which would require interpretation. By this action the institute will seek to induce all countries in its membership to adopt substantially the crop reporting basis employed in the United States, which will enable the reports of the several countries to be combined into a single statement readily understood. The assembly also recommended the appointment of "an international technical commission, composed of eminent specialists from the adhering countries, to take up and study effective international protection against the invasion and spread of diseases of plants and insect pests." Provision was considered for the continued printing of the institute's publications in English. The United States delegates expressed their conviction of the importance of the work which the institute is conducting.

The appointment of a salaried delegate from the United States to this institute was authorized for the first time in the diplomatic and consular appropriation act, \$3600 being provided in addition to the \$4800 which is the United States' quota toward the support of the institute.

The publication of bulletins from the Bureau of Economic and Social Intelligence, relating to the organization of agriculture in different countries, coöperation among farmers of various forms, etc., has been begun; and the statistical service has been extended to include the production of sugar beets and wine.

BRITISH DEVELOPMENT FUND. The Development Commissioners who were appointed under the Development and Road Improvement Funds acts of 1909 in Great Britain issued a report during the summer, outlining the general principles and plans decided upon. In agriculture they aim (1) at increasing the amount and quality of production by aiding in the extension of a system of scientific investigation and research, and a system of education to bring the results into practice, and (2) at increasing the variety of production, by determining what new crops and industries can be added with reasonable probability of profit. Hemp, flax, tobacco, and the sugar beet are crops to which attention has already been turned. Furthermore, they propose to encourage in particular the organization of co-operative enterprises. The preparation of a trained staff is considered a necessary first step, the number of men qualified to conduct agricultural research in Great Britain being inadequate.

The commissioners have allocated roughly £165,000 (nearly \$825,000) per annum, and made £100,000 non-recurring advances. By far the larger proportion of this will go for agricultural research and instruction, viz: England and Wales £105,000 per annum, Scotland £60,000, and Ireland £9000 per annum. This is in addition to schemes for which no definite estimates have yet been made, such as forestry in England and Wales, purchase of a demonstration forest area in Scotland and establish-

ment there of a central school of forestry, the development of Irish fisheries and fishery harbors, and the encouragement of coöperation throughout the United Kingdom.

In the first nine months of their work the commissioners allocated one-third of the annual income guaranteed to the Development Fund for five years.

Early in 1911 a grant of about \$200,000 for the year was made to the Board of Agriculture and Fisheries for the encouragement of light horse breeding in Great Britain. Subsequently an allotment of £50,000 (about \$250,000) a year was made to the Board of Agriculture and Fisheries for research in the various branches of agriculture, to be conducted at institutions already established, for the study of problems of local importance, the provision of advice for farmers on technical questions, and scholarships with a view to fitting men for agricultural research. For the latter purpose the board has awarded twelve scholarships in agricultural science, mostly to men at Cambridge University. The scholarships are for £150 a year, and are tenable for three years. It has also set aside £12,000 a year for grants to certain universities and agricultural colleges in England and Wales to assist in supplying technical advice to farmers and to provide for the investigation of local agricultural problems.

The Development Commissioners have also made a grant for investigating "teart land" (that is, *tart*, or sour land), a term applied to certain pastures in Somersetshire on which cattle scour, £17,000 for the purchase of an area for afforestation in Ireland, and £10,000 for the improvement of horse breeding, and have appropriated to the Board of Education an amount not to exceed £1,576,250 to March 31, 1916, to be used in providing county staffs of agricultural instructors, working from farm institutes as their headquarters, to hold central and itinerant courses.

IMPORTANT EVENTS. A State Board of Agriculture has been established in Alabama under the provisions of an act of the last legislature. This granted an appropriation of \$25,000 out of the fertilizer tag tax for use in farm demonstration work. The Porto Rico Board of Agriculture was organized in June as a branch of the local government. In addition to inspection and quarantine work, arrangements have been made for a survey of the birds and forest resources of the island, with measures for their development, and for the collection of agricultural statistics. A ministry of agriculture and commerce has recently been established in Greece. Steps are being taken for the improvement of the native breed of horses, by the location of good stallions at centres throughout the country. Agricultural experiment stations have been opened, a programme has been arranged for teaching agriculture in the village schools, and the spraying of fruits and vines is being promoted.

A department, headed by a director, has been organized in the islands of Trinidad and Tobago, and a board of agriculture established. In Jamaica a new department of agriculture has taken over the duties of the board of agriculture, the department of public gardens and plantations, and other agencies. A separate board of agriculture was provided for in

Scotland. The government of Ecuador has decided to provide a division for agriculture in the General Direction of Statistics. Steps have been taken in the different provinces for the collection of the preliminary data necessary in the estimation of agricultural production. The Chinese government has also begun the organization of a service for agricultural statistics, and it is expected will be in position to supply information as to the cultivation and production of its most important crops.

At the close of 1910 the French Chamber of Deputies directed the Ministry of Agriculture to undertake the development of work in agricultural meteorology. In accordance with this a committee of sixty-four members has been organized, headed by M. Violle, of the Institute of France, to prepare plans for such a service. In the provision of a separate service for the benefit of agriculture France is following the example of Russia. This movement attracted considerable attention at the last general assembly of the International Institute of Agriculture at Rome, where the international organization of such work was considered.

A service for the inspection of plants for disease was established in France during the year. This is similar to the nursery inspection provided in the United States, and is under the direction of the Ministry of Agriculture. The Russian Department of Agriculture has founded at the Rigi Polytechnicum a school for specialists in swamp cultivation.

Mr. Frederick W. Taylor, of Colorado, has been appointed director of agriculture in the Philippines to succeed Dr. George E. Nelson, resigned. In Belgium Professor Paul de Vuyst, formerly inspector-general of agriculture, has been made director-general of agriculture. Hon. Martin Burrell, a fruit grower of British Columbia, has been appointed minister of agriculture for the Dominion of Canada. Lord Carrington has retired as president of the Board of Agriculture and Fisheries in Great Britain, and has been succeeded by Mr. Walter Runciman, formerly minister for education. Lord Lucas has become parliamentary secretary of agriculture, in succession to Sir Edward Strachey.

Australia has begun the shipment of wheat to Japan, the first commercial shipment, amounting to 500 tons, being made in March, 1911. The Department of Agriculture and Technical Instruction in Ireland is encouraging the breeding of Irish draft horses for general farm and harness work, offering prizes and proposing to purchase colts found suitable for registration.

For several years experiments have been in progress by the United States Department of Agriculture in the production of a new and useful hybrid of the mule type, using the zebra in place of the jack. Eleven of these zebra-ass hybrids have been foaled. They show a decided improvement over either parent in action, conformation, and disposition, and make rapid growth as colts. They have been broken to ride and to draw a load, but their fertility has not yet been tested.

The Department of Agriculture is securing highly satisfactory results in its tea-farming experiments. On the 100 acres in South Carolina, about 12,000 lbs. of tea were produced in 1911, worth fully \$1.00 a pound. A ready

market is found for the product within a limited distance.

Guayule as a rubber plant has been exploited for several years, and the industry of making rubber from it is now in operation in Mexico, where it is said that fully \$30,000,000 of American capital is invested. Nearly two million pounds of guayule rubber were shipped from northern Mexico the latter part of February. The plant grows wild in New Mexico and Arizona, and its use is being exploited. It is prophesied that the wild supply in Mexico will soon be exhausted, as the plant is a very slow grower. The profitableness of its cultivation has not yet been demonstrated.

The New Zealand government has announced through the minister of agriculture a prize or prizes of about \$60,000 for improvements connected with (1) the extraction and dressing of fibre from the New Zealand hemp or flax plant, *Phormium tenax*, or (2) the utilization of the by-products obtained in the process. This plant is entirely different from any other hemp or flax plant, the fibre being imbedded in tough vegetable matter containing a gum and a coloring matter. The greatest difficulty lies in the removal of the vegetable refuse, gum, and dye without damaging or staining the fibre.

A remarkable demonstration of the practicability of the traction plow was given at Purdue University in October, when a new world's record in plowing was established. Three traction engines hitched to a unit of 50 plows, placed side by side, turned over a stubble field at the rate of one acre every 4½ minutes, with a fuel cost for the three engines of 8½ cents per hour. The swath turned over was sixty feet wide, the plows being set 4½ to 5 inches deep. Each of the 50 plows worked independently of the others, rising and falling with the undulations of the ground, demonstrating the utility of such gang plows on uneven land as well as on an absolutely smooth field.

CONGRESSES AND EXPOSITIONS. The International Dry Farming Congress, at Colorado Springs, Col., in October, 1911, was the most helpful session of this congress. The real students of the problem were in control, and land booming was less in evidence. In connection with it a congress of farm women was held, the first of its kind in this country.

The ninth International Agricultural Congress was held at Madrid, Spain, May 1-8, 1911. It divided into eight sections, covering the various branches of agriculture, rural development, agricultural education, and co-operation. Resolutions embracing recommendations upon a number of important points were passed by the congress. It has been decided to hold the tenth international congress in Belgium, in 1913.

The second International Brewers' Congress and an international barley and hop prize exhibition were held in Chicago, October 12-22. One section was devoted to agriculture—barley and other cereals, and hops. There was an International Congress of Apiculture at Turin in September. An International Fibre Congress and exposition were held at Soerabaya, Java, during July. The aims were to further the cultivation of fibres in the tropics, to attain uniformity in product, to show the value of various fibre plants for cultivation, and gen-

eral conference. Representatives were present from various foreign governments, including the United States, Austria, Germany, and Belgium. The exhibits of fibre and fibre-cleaning machinery were pronounced excellent. The fourth International Genetic Congress, in Paris, was occupied mainly with the results of breeding studies on plants to secure special qualities.

A South American Congress of Agricultural Sciences is being arranged for, to be held in Buenos Ayres in July, 1913. The Argentine Rural Society, the National Society of Agricultural Engineers, and the National Schools of Agriculture at Buenos Ayres and La Plata are entrusted with the organization of the congress.

A pure-bred sire league, started at the Wisconsin Agricultural College, has been organized as a national movement to promote the use of pure-bred stock in animal breeding. The National Corn Exposition, at Columbus, Ohio, in February, 1911, was a distinctly national event, exhibits being shown from thirty-five States, with extensive educational exhibits from a large number of institutions. The International Livestock Exposition at Chicago near the close of the year was the largest in the record of entries, and was conceded to be the greatest in point of merit. The carload lots were the marvel of the show, reflecting great credit on their skillful feeding, and the draft horse exhibit was an unparalleled one.

The twenty-fifth annual exhibition of the German Agricultural Society was held at Cassel. The show was notable for the absence of cattle, due to the prevalence of foot-and-mouth disease, and as a show without cattle was unsatisfactory it was decided not to attempt to hold one in 1912.

The Royal Agricultural Show in England was held at Norwich, in June. The one hundred and thirteenth Fat Stock Show of the far-famed Smithfield Club, at London, in December, was of the usual high order of merit, the prize list being the largest of any year except the centenary show.

LITERATURE. Of the long list of agricultural books which appeared during the year the following may be mentioned: *Rural Denmark and Its Lesson*, H. Rider Haggard (London and New York, 1911); *Text-Book of Egyptian Agriculture*, edited by G. P. Foaden and F. Fletcher; *Feeding of Crops and Stock: An Introduction to the Science of Nutrition of Plants and Animals*, A. D. Hall (London, 1911); *Landlexikon*, Konrad zu Putlitz and Lothar Meyer (Stuttgart, 1911); *Dry Farming: A System of Agriculture for Countries under Low Rainfall*, John A. Widtsoe (New York, 1911); *Agriculture in the Central Part of the Semiarid Portion of the Great Plains* (relates to dry farming), J. A. Warren, United States Department of Agriculture (1911); *Agricultural Explorations in the Fruit and Nut Orchards of China*, Frank N. Meyer, United States Department of Agriculture (1911); *Power and the Plow*, L. W. Ellis and E. A. Rumely (New York, 1911); *Guayule, A Rubber Plant of the Chihuahuan Desert*, F. E. Lloyd (Carnegie Institution of Washington, 1911); *The Sugar Industry of Mauritius: A Study in Correlation, Including a Scheme of Insurance of the Cane Crop against Damage Caused by Cyclones*, A. Walter (London, 1910); *Farmers of Forty Centuries, or*

Permanent Agriculture in China, Korea, and Japan, F. H. King (Madison, Wis., 1911).

AIKEN, CHARLES FREDERICK. An American editor and writer, died January 6, 1911. He was born at Cleveland, Ohio, in 1863 and was educated in the University of California. He was employed on the editorial staff of several San Francisco papers and in 1900 became editor of the *Sunset Magazine*, of which, except for a brief interval, he remained editor until the time of his death. He also acted as correspondent for several New York, Philadelphia, and Washington papers. He contributed largely to magazines and periodical articles dealing chiefly with Western development. He was the author of three monographs, *San Francisco* (1903); *California To-Day* (1904); *The Road of a Thousand Wonders* (1905). He was an active member of the Bohemian Club of San Francisco and was the author of several literary and dramatic productions that have made that organization famous.

AIRD, Sir JOHN. An English engineer, died January 6, 1911. He was born in 1833 and was educated privately. At an early age he joined his father in business as a contractor. When he was eighteen years old he was entrusted with a large amount of important work in connection with the Exhibition of 1857. He afterwards became largely connected with the building of gas and water works in England and elsewhere. He was best known, however, in connection with the damming of the Nile. In 1898 the firm of John Aird & Company contracted to build the Assuan Dam and Assiut Barrage and to complete the work in five years. The task was completed in 1902, a year before the expiration of the time stipulated in the contract and three and one-half years after the laying of the first stone. Sir John Aird was returned as member of Parliament in the Conservative interest from North Paddington in 1887 and held the seat until 1905. He was made a baronet in 1901.

AIRSHIPS. See AERONAUTICS.

ALABAMA. POPULATION. The population of the State according to the Thirteenth Census, taken in 1910, was 2,138,093 as compared with 1,828,697 in 1900, an increase in the decade of 16.9 per cent. The chief towns with their population in 1910 and 1900 are as follows (the figures in parentheses are for 1900): Birmingham, 132,695 (38,415); Anniston, 12,794 (9,695); Selma, 13,649 (8,713); Bessemer, 10,864 (6,358); Gadsden, 10,557 (4,282).

AGRICULTURE. The acreage, production, and value of the leading crops in 1910 and 1911 are given in the following table:

	Acreage	Prod., bu.	Value
Corn1911	3,000,000	54,000,000	\$42,120,000
.....1910	2,850,000	51,300,000	36,423,000
Wheat1911	30,000	345,000	414,000
.....1910	28,000	336,000	380,000
Oats1911	283,000	5,434,000	3,586,000
.....1910	283,000	5,286,000	3,142,000
Rye1911	1,000	10,000	12,000

MINERAL PRODUCTION. The total value of the mineral products in 1910 was \$47,751,059. Coal and pig iron were the chief mineral products.

The coal production in the State in 1910 was 16,091,979 short tons, valued at \$20,209,537. This is a large increase over the production of 1909, which was 13,703,450 short tons. This unusually large tonnage was due primarily to the strike in Illinois and other Western States, and secondarily to low water in the Ohio and Kanawha rivers, which reduced shipments from Pennsylvania and West Virginia to Mississippi River towns. This produced a large demand for Alabama coal. The average price per ton in 1910 was \$1.26 against \$1.19 in 1909. The coal mines of the State were practically free from strikes in 1910. The industry was marked during the year by two bad disasters, which together cost the lives of 131 men. The first occurred on April 20, at Mulga mine and cost 40 lives and the second at the Palos mine and cost 91 lives. The total number of fatal accidents in 1910 was 238. There were employed in the coal mines of the State, in 1910, 22,210 men, who worked on an average 249 days, chiefly of ten hours.

According to estimates made at the end of the year the output in 1911 was about ten per cent. over that of 1910. This was due chiefly to the curtailment of the production of pig iron with a proportionate reduction in coke and to curtailment of the output of coal from the mines of the iron making companies. Labor conditions were normal, the supply being sufficient and without interruption because of strikes.

The State ranks third in the production of iron ore. In 1910, 4,801,275 tons were mined, with a value of \$6,082,722, as compared with 4,321,252 tons valued at \$4,996,455 in 1909. See IRON AND STEEL.

Gold was produced in the State in 1910 to the amount of 1622 fine ounces, valued at \$33,533. A small amount of silver was also mined. No copper was mined in the State in 1910.

EDUCATION. The total enrollment of the schools in the State in 1911 was 431,707. Of these 287,102 were white and 144,605 were colored. The enrollment in the elementary schools was 419,798, of which 275,917 were white and 143,881 were colored. The total number of schools taught during the year was 6566, of which 4590 were for white and 1976 for colored pupils. The average yearly salary of teachers was—for male white teachers, \$413; for female, \$340; for male colored teachers, \$169; for female colored, \$150. The disbursement for the public schools for instruction during the year was \$2,865,254. Of this amount, \$2,507,669 was for white teachers and \$357,585 for colored teachers.

POLITICS AND GOVERNMENT

The State legislature met in 1911 and the measures passed by the session will be found noted below in the paragraph *Legislation*. On January 18, the legislature reflected John H. Bankhead to the United States Senate. Perhaps the most important political event of the year was the passage of the Parks local option bill, which is a virtual repeal of the Statewide prohibition statutes which have existed in the State for nearly three years. In 1909 a constitutional amendment providing for prohibition was overwhelmingly defeated by the voters.

The campaign for governor in 1910 was virtually along the lines of opposition or support of more stringent liquor laws in the State. In this contest the local option element was represented by Emmett O'Neal, while the Prohibitionists had as their candidate Colonel H. S. D. Mallory. Colonel O'Neal was nominated and subsequently elected. There were other indications during 1910 that the sentiment of a majority of the people was for some system of local option. At a meeting of the legislature in 1911 a measure was introduced providing for local option in the State. On February 9 the bill was passed in the House by a vote of 58 to 44, and on February 17 the Senate took similar action. On February 21 the bill was signed by Governor O'Neal. This bill makes the county a unit in voting on the liquor question. To guard against frequent agitation and elections, the bill also provides that an election may be held in any county only on petition signed by 45 per cent. of the number of qualified voters participating in the last previous general election. The passage of the bill through the House and Senate met with bitter opposition on the part of advocates of prohibition, and charges were made by them that the bill was passed because of broken pledges of legislators. A local option election held in Montgomery on July 17 resulted in the defeat of prohibition in that city, where it had been in effect since 1909. Local option was carried by a large majority. Russell county on the same day voted for local option. Other counties which vote out prohibition during the year included Colbert, Jefferson, Mobile, Madison, and Pike. Madison county voted for the reestablishment of a dispensary. On June 5 the voters of Mobile adopted the commission form of government by a substantial majority. The following towns and cities of Alabama are now under this form of government: Birmingham, Cordova, Hartselle, Huntsville, Mobile, Montgomery, Talladega, and Tuscaloosa.

The legislature during the year also created the State Court of Appeals to relieve the State Supreme Court. The new court has final jurisdiction in minor cases.

A State highway commission was created to encourage and have supervision over the construction of roads in the various counties of the State.

An important decision affecting the practice of peonage was rendered by the United States Supreme Court in January. The State statutes upholding the system, as alleged to have been practiced in the State, which were sustained by the Alabama Supreme Court, were declared contrary to the federal Constitution. The case in which decision was rendered was that of Alonzo Bailey, a negro, who made a contract with a company to work as a farm hand for a year at \$12 a month, received in advance pay the sum of \$15. After working for a little over a month he stopped work, but did not refund the money. According to the Alabama law, refusal to work after such a contract is made without refunding the whole advance payment is *prima facie* evidence that the employee intended to defraud his employer. In order to escape conviction for fraud, the employee has then to prove positively that he did not intend to act fraudulently. The law, however, prohibits him from testifying directly as to his own intentions. He is therefore convicted of fraud

by virtue of stopping work, and is then heavily fined and in lieu of payment is put to work without remuneration. The case of Bailey was previously presented to the Supreme Court, but was sent back to the lower courts because all the requisite formalities had not been observed. In the fall of 1910 it again arrived at the Supreme Court. The decision declared the Alabama law contrary to the Constitution and was rendered by Justice Hughes. The dissenting opinion was written by Justice Holmes.

OTHER EVENTS. On May 26 the city of Mobile began the celebration of its two-hundredth anniversary. On April 8 an explosion in the Banner mine near Littleton resulted in the death of 128 miners, most of them convicts.

LEGISLATION. The important acts passed at the legislative session of 1911 included the following: An act was passed creating a Court of Appeals consisting of three judges. This court has final jurisdiction of all civil cases excepting actions to try the title of land where the amount involved, exclusive of interest and costs, does not exceed \$1000. A measure designed to enforce better sanitary conditions in inns, hotels, and restaurants was passed. A bank department of the State was created, under whose supervision all State banks are placed. A number of measures were passed providing for the adoption by the people of a commission form of government by municipalities of the State. A local option act permitting counties by a vote to authorize the sale of vinous spirituous liquors, and the establishment of an excise board, having under its control the issuance of licenses where the sale of liquor has been authorized, was enacted. A State prison inspector was created. It was made a capital felony wantonly to wreck railroad trains. A reformatory for wayward and delinquent females was authorized. The statute relating to the mining of coal in the State was amplified, and a measure was passed regulating the consolidation of insurance companies.

STATE OFFICERS IN 1911: Governor, Emmett O'Neal; Lieutenant-Governor, W. D. Seed; Secretary of State, Cyrus B. Brown; Auditor, C. B. Smith; Adjutant-General, J. B. Scully; Attorney-General, R. C. Brickell; Treasurer, John Purifoy; Superintendent of Education, H. J. Willingham; Commissioner of Agriculture, R. F. Kolb; ex-officio Commissioner of Insurance, Cyrus B. Brown—all Democrats.

SUPREME COURT: Chief Justice, J. R. Dowdell; Associate Justices, Ormond Somerville, A. D. Sayre, John C. Anderson, R. T. Simpson, J. J. Mayfield, and Thomas McClellan; Clerk, R. F. Ligon, Jr.—all Democrats.

STATE LEGISLATURE, 1911: Senate, Democrats, 34; Republicans, 1; House, Democrats, 100; Republicans, 4; joint ballot, Democrats, 134; Republicans, 5. Democratic majority, Senate 33; House, 96; joint ballot, 129.

The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

ALASKA. A territorial possession of the United States, situated at the northwestern extremity of North America. Its total area, according to a revised survey made in 1906, is 586,400 square miles.

POPULATION. The population of Alaska, according to the United States Census of 1910, was 64,356, divided almost equally between whites and natives. There are fourteen incor-

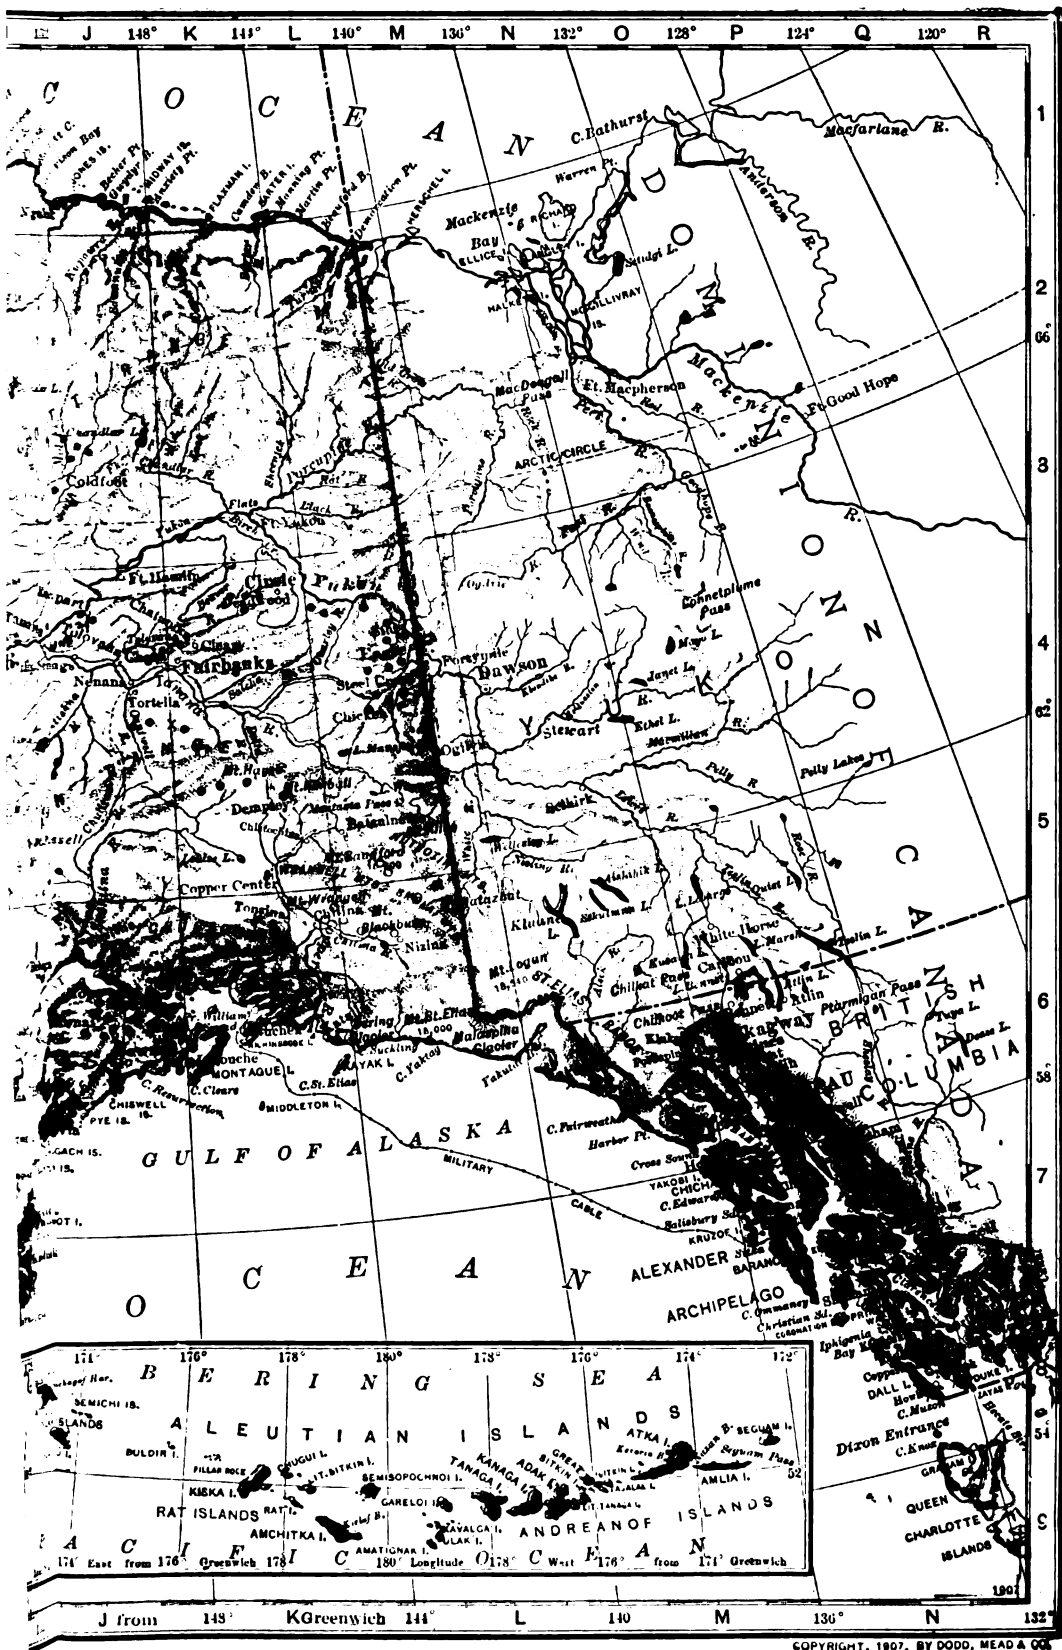

porated towns in the Territory; and of these, five increased in population between 1900 and 1910, five decreased and four are towns which did not exist in 1900. Of all the principal white settlements or mixed white and native settlements appearing in the census returns of 1910, nine showed an increase and fourteen a decrease, while twenty-seven new settlements came into being and four disappeared. The territory is divided into four judicial districts, as follows: The First Judicial Division, with a population of about 9000; the Second Judicial Division, with Nome as its centre of population, 7000; the Third Judicial Division, with Valdez and Cordova as centres of population, 7000; and the Fourth Judicial Division, with Fairbanks as a centre of population, 10,000. The population of the Territory is engaged almost entirely in mining, railway construction, fishing, and occupations related thereto. A few people, chiefly near the mining camps, are engaged in truck farming.

AGRICULTURE. During recent years the possibility of agriculture in Alaska has been widely discussed, and investigations have shown that a considerable portion of the Territory is adapted to the growing of crops. The feasibility of growing wheat, except in an experimental way, is still a matter of doubt, but the successful raising of barley, oats, hay, vegetables, and live-stock has been demonstrated. At an agricultural fair held in Fairbanks, which is in the same latitude as middle Norway, in May, 1911, a great variety of native farm products was shown, which included ripe grain, both thrashed and in sheaf.

The Department of Agriculture has carried on successful experimental work and has shown the possibility of the successful growing of garden vegetables. In 1911, as a result of the increase in farming, the shipments of potatoes from the States was smaller by 25,149 bushels than in 1910; of hay, by 2155 tons; of beans and peas, by 7322 bushels; and of onions, by 964 bushels.

The luxuriant growth of grasses in the territory surrounding Cook Inlet, and in other regions where the winter climate is comparatively mild, induces the belief that stock raising will eventually become a profitable industry. The grazing areas in the Territory are of large extent. In several localities, cattle and horses having been left at the end of the working season to shift for themselves have survived the winter without artificial shelter. White clover grows wild everywhere in the territory south of the Arctic Circle.

MINERAL PRODUCTION. Mining is the chief industry in Alaska. Its settlement has resulted largely from the discoveries of gold. The production of gold for 1910 was 787,148 fine ounces, valued at \$16,271,800. The production of copper was 4,311,026 pounds, valued at \$547,500. These are the chief mineral products. Small quantities of coal, lead, silver, stone, and other minerals are also produced. The total value of the mineral production in 1910 was \$17,191,688. The total value of the mineral output of 1911 is estimated by the United States Geological Survey at \$20,370,000, of which the gold produced was valued at \$17,150,000. The copper production in 1911 was estimated at 22,900,000 pounds, valued at about \$2,830,000. This is, as will be seen, a notable increase over the production of 1910. Most of the gold produced in the Territory comes from placer mines,

although much progress was made during 1911 in paving the way for an increased output from auriferous lodes. This work was carried on in most of the gold-bearing areas of the Territory, but the most notable advance was in the Juneau, Valdez, Kenai Peninsula, Willow Creek, and Fairbanks districts. Prospecting for gold was carried on during the year, especially in the Prince William Sound region. Of the production of the new Iditarod fields, there was little detailed information at the end of the year. It was reported that the total gold production from these fields in 1911 would reach a value of \$3,500,000, as compared with \$800,000 in the previous year. The larger portion of the gold obtained from placer mines came from Fairbanks. The gold production of the Seward Peninsula for 1911 was valued at about \$3,100,000, as compared with a value of \$3,500,000 in 1910. Several new placer mines were found in 1911 at Red Mountain on the headwaters of the Indian River, and in the Ruby Creek region of the Yukon.

The coal resources of Alaska have been more a matter of political than industrial importance. This important question will be found discussed in detail in the account of the visit of Secretary Fisher to Alaska, and the results of his investigations.

TRANSPORTATION. The crying need of Alaska is additional railroad facilities for opening up undeveloped sections of the Territory. This problem in its wider aspects will be found discussed in the paragraphs below dealing with the investigations of Secretary Fisher. There was little actual construction of lines during the year. The Copper River & Northwestern Railway extended its line from Chitina to Kenecott, a distance of sixty-five miles, making the total mileage from tidewater on Cordova Bay 197. This road forms an important link in the improved transportation route between Prince William Sound and the great valley of the Tanana. No work was done on the Alaska Northern Railroad, whose track extends as far as Kern Creek at Turnagain Arm, seventy-two miles from the ocean terminal on Resurrection Bay. At the close of 1911 there were 465 miles of railroad in the Territory, compared with 371 miles in 1910. This mileage is distributed over nine different railroads from five to 196 miles in length.

The Alaska Road Commission did important work in making mining districts accessible by the building of wagon roads and trails. Perhaps the most important undertaking of this kind was the completion of the winter trail from Seward on the Pacific slope to the Iditarod placer district. This shortens the winter route to Nome by about 300 miles.

COMMERCE. The products of Alaska shipped to the States in the fiscal year 1911, other than gold and silver, were larger in value than in any year previous in the history of the Territory. The increase as compared with 1910 was due almost entirely to the large production of canned salmon and of copper ore, the shipments of the latter being increased upon the completion of the railway in the Copper River Valley. The total shipments other than those of precious metals were valued at \$13,813,824 as against \$12,349,402 in 1910. The domestic shipments of gold and silver in the fiscal year 1911 were valued at \$15,171,008 as against \$18,401,849 in 1910. There was a

falling off in shipments of domestic merchandise from the States to Alaska during the fiscal year, the total being smaller than in any year since 1906. The value of coal shipped into Alaska from the United States for domestic consumption decreased, but there was an increase in the quantity from foreign countries. The value of coal brought in from both sources was slightly less in the fiscal year 1911 than in 1910.

FISHERIES. Next to mining, the products of the fishing industry are the most valuable. Statistics for 1911 are not available, but in 1910 there were employed in the several branches of the fisheries 15,620 persons, an increase of 3032 over 1909. The total investment in fisheries was \$20,711,422. The finished product was 214,536,433 pounds, having an export value of \$13,259,859. The salmon output in 1911 was the greatest in the history of the industry. There were packed 2,876,000 cases of four dozen one-pound cans each. Thirteen more canneries were operated in 1911 than in 1910. Other fish which are produced in large numbers are halibut, cod, and herring.

FURS. The value of the furs exported during the fiscal year 1911 was \$394,485, as compared with a value of \$574,764 in 1910. Owing to the inadequate protection of certain species of fur-bearing animals the annual output of furs in Alaska is gradually decreasing. New regulations promulgated in 1910 for the regulation of hunting seals and other fur-bearing animals have resulted beneficially, but there is need of further regulations.

EDUCATION. White schools or schools for white children are conducted in the larger towns and settlements of the Territory. During the year a manual training department was established in the large schools at Kodiak and on Wood Island. Two schools were transferred to newly incorporated towns during the year and three new schools were established. The total cost of the maintenance of the schools for white children during 1911 was \$43,484.

Schools for Natives. About eighty schools for natives are maintained. These are administered by the Bureau of Education at Washington, through a general superintendent and four district superintendents in Alaska.

INDIANS. The condition of the Indians, although improved in recent years, still offers a serious problem in the administration of the Territory. The chief obstacle to the progress of the native races in southeastern Alaska and the Yukon Basin is the sale of liquor. The prevalence of unsanitary conditions is also a menace to the health of the natives. During 1911 a more effective effort was made to break up the liquor traffic among the Indians. This was made possible by the appropriation of \$12,000 for the employment of special agents for the enforcement of the liquor law.

POLITICS AND GOVERNMENT

The question of a proper form of government for the Territory, which has been before Congress for several years, received no definite action during the year. Recommendations made by President Taft in his annual messages in 1909-10 were repeated in 1911. In a speech delivered on October 9, the President declared that while he favored a government by commission he was willing to compromise on a partially elected and partially appointed com-

mission out of deference to the wishes of the people. In the opinion of Governor Clark the chief faults of the present government are not found in the mere form of government nor in the instrumentalities provided in administering it; they arise rather from a lack of certain laws especially suited to local needs. In general, he is in favor of a local territorial government with an elective legislature. In his opinion, legislative measures relating to coal lands, fisheries, mining law amendments, quarantine, sanitation and public health, and compulsory school attendance are urgently necessary.

The vexed matter of the coal fields and their proper operation is discussed below. The action of the Department of the Interior in pronouncing the patents of the Cunningham claims illegal put a final end to the wearisome controversy.

CONTROLLER BAY. The general question of the public lands was opened up, however, by President Taft in throwing open to private entry in July a tract containing 12,800 acres of land on Controller Bay, near the Bering coal fields. In these coal fields are situated the Cunningham claims which were the chief subject of the Ballinger-Pinchot controversy. Charges were made that these grants were made in favor of a monopoly which was endeavoring to secure control of the one good harbor from which coal mined in these fields could be brought.

President Taft on July 26 sent a message to Congress with the avowed purpose of reassuring the American people that the alleged danger of monopoly was not a real danger. In this message he set forth at considerable length his reasons for throwing open this tract of land for private entry. The history of this action, as stated by the President, was as follows: Shortly before Gifford Pinchot ceased to be chief forester, R. S. Ryan applied for the elimination of enough land at Controller Bay to enable the railway company which he represented to secure a site for terminals, shops, etc., on the north side of the bay. The question was submitted to the Forestry Bureau, to the Navy Department, the Secretary of Agriculture, the Secretary of the Interior, and the General Land Office. Mr. Graves, who succeeded Mr. Pinchot as chief forester, reported that he had no objection to eliminating 18,000 acres. The final recommendation was, however, that the elimination be limited to 320 acres and an order was drawn up to this effect. As the amount of land eliminated was small, the provision that it should take effect only after thirty days following its issuance was omitted. The President decided that to grant a tract of land of this size to a single railway company was not desirable, especially because there was no room on such a tract for a terminal town. On his initiative, therefore, he enlarged the proposed elimination from 320 acres to 12,800 acres. The order was issued on October 28, 1910. The President received assurance from the Morgan-Guggenheim syndicate that it had no connection with the railway which Mr. Ryan represented.

The President pointed out that his action in throwing open this land to entry was reasonable and right for three reasons: First, the need of town sites; second, the reservation of the government to certain alternating strips of land; and, third, the control reserved to the govern-

ment of the shallow waters of the bay. On the first point, he declared that in a forest reservation there was no opportunity to secure town sites or proper terminals for a coal road and shipping point. He pointed out that in President Roosevelt's administration several areas had been eliminated on the recommendation of Mr. Pinchot, as well as over 30,000 acres of water front in a harbor known as Valdez Arm. He pointed out also that the Morgan-Guggenheim syndicate already has a route from the Bering coal fields, and declared that the only effect, in his opinion, of preventing railroad construction at Controller Bay would be to leave the field entirely to the Copper River Railway, which is owned by the Morgan-Guggenheim syndicate. He called attention to the fact that even if the claims on the eliminated tract should be allowed to pass to patent, the owner would not have access to deep water, as there is a stretch of mud flats between the shore line and the ship channel. The government would retain absolute control of the building of trestles over these flats.

The President denied emphatically certain allegations of improper influence with regard to the other point of these claims contained in the reputed communication between Richard S. Ryan and Mr. Ballinger, former Secretary of the Interior. The President declared this letter a forgery and denied that he had ever seen it previous to its publication in the various newspapers.

A committee of Representatives carried on an investigation, which was placed in the hands of Louis D. Brandeis. On November 28 he reported that no action on the part of the committee was required, thus instantly exonerating the President from blame. Later the committee reported that the charges made were not sustained. See *UNITED STATES, Congress*.

VISIT OF SECRETARY FISHER. Walter L. Fisher, Secretary of the Interior, made an extensive trip in Alaska during the summer of 1911. His object was to see for himself the conditions under which the most serious problems with which the department has to deal have arisen.

The results of the visit of Secretary Fisher and his conclusions derived from his observations were embodied in an address made at the meeting of the American Mining Congress at Chicago on October 27, 1911. These conclusions may be summarized as follows: He declared that the existing coal land laws applicable to Alaska neither promoted development nor protected the public interests. All coal fields are at the present time withdrawn from entry. Numerous claims under entries made or attempted to be made prior to the withdrawal are pending in the Department of the Interior. As regards railway transportation, Secretary Fisher spoke thus: "Aside from the White Pass and Yukon Road, there is only one real railroad in Alaska and that is the Copper River & Southwestern Railroad which leads from Cordova on Prince Williams Sound, 200 miles up the Copper River and its eastern tributary Chitina to the Bonanza copper field, and is reported to have cost approximately \$20,000,000. The White Pass & Yukon Railroad is an excellent narrow-gauge road along the line of the historic trail that leads over the mountains and down the Yukon to the gold fields of the Klondike, but only a small part of this railroad is in the United States. The Alaska Northern Railroad

starts from Seward for the Matanuska coal fields and the Yukon, but stops discouraged 71 miles north of Seward. The present cry in Alaska and among those who are financially interested in Alaska is that development has been stopped by the withdrawal of the coal fields from entry. I am convinced that the coal withdrawals have exerted only an incidental influence upon the development of railroads in the Territory. Even if the withdrawals had not been made, the enforcement of the restrictive provisions of the present law and of the act of 1904 would have had substantially the same effect as the withdrawals themselves. The critics of the withdrawals are usually either those who do not realize the prohibitory effect of the coal laws in Alaska or those who have assumed that these laws could be violated with impunity. If the coal fields had remained open to unrestricted private exploitation, railroad development might have been stimulated, but in that event the profits of the coal and not of the railroads would have been the incentive to construction."

Mr. Fisher made a careful examination of the coal fields and his observations may be summarized as below: The coal of Alaska is of great value, but its extent and character have been greatly exaggerated. There are great quantities of lignite and low-grade bituminous coal in several parts of the Territory, but there are only two fields of accessible high-grade coal. The better known of these two fields is the Bering River field which is near Controller Bay and in which the Cunningham claims were located. In this field the Alaskan controversy has been fiercest and most bitter. The other, the Matanuska field, is larger and may prove to be more important. Both of these fields contain anthracite and high-grade bituminous coals. The chief question is how they shall be opened so as to promote development and protect public interests. It is possible to open up the coal fields so as to enable a larger or smaller number of individuals or groups of individuals to make money out of its development, bringing with this development considerable incidental benefit to the community as a whole through the expenditure of money and the employment of men; the other alternative is to open the fields on terms which will offer the operator a sufficient profit to furnish an adequate incentive for his investment and his efforts, but which will result in placing the coal upon the market at the cheapest price consistent with this incentive, conferring upon the community the manifold advantages of cheap fuel and of the development of the many forms of industrial enterprise that cheap fuel renders possible. In the opinion of Mr. Fisher, the second of these objects is the one to be attained. To consider, however, the question of a market for the coal is most important. There is at present on the Pacific coast no available anthracite except that in Alaska. It would be natural, therefore, to expect an immediate demand for this particular kind of coal. There is also little high-grade bituminous on either the eastern or western border of the Pacific and it might be assumed that there would be a considerable demand for coal of this character. There is little, if any, high-grade coking coal on the Pacific coast except in Alaska and there is an immediate demand for a certain amount of this coal for smelting copper and other ores. Except the

coal for coking use, Alaskan coal must contend with serious competition. There are considerable quantities of lignite and low-grade bituminous coal throughout the Pacific Northwest and in British Columbia. Much of the bituminous coal is of a fair quality. When freight and handling charges are taken into consideration, for steaming purposes the coal of British Columbia and of the Northwestern States will hold everything but the Alaskan market itself against competition from any of the Alaskan except that of the very highest grade, and this quality may expect to win only where special considerations control. The most serious competitor for ordinary heating and steaming purposes is California oil, which is already supplanting coal in many fields and possesses advantages in economy and convenience of handling. In Mr. Fisher's opinion, the present market for Alaskan coal is limited and uncertain, but the demand in Alaska will rapidly increase as the country is developed. If the mines are opened, in his opinion, there will be immediately established on Prince Williams Sound one or more smelters capable of smelting the copper ores and other ores which exist in large quantities in various parts of the Territory.

From his examination of the Bering coal field, Mr. Fisher found that it covered fifty square miles or 32,000 acres, lying approximately 25 miles from the coast of Controller Bay. This field was discovered in 1896 and it is practically all covered by claims under the law of 1904. As a result of the sliding of the stratification of this field, the larger portion of the coal beds have been so crushed as to leave what otherwise would have been the highest grade of bituminous coal so that much of it cannot be mined as lump coal. There is, however, some coal in the field that can be mined as lump. These conditions add to the difficulty of mining in this field. Aside from its crushed condition, much of the coal itself is of excellent quality, possessing high thermal value. The crushed condition does not impair the coking quality if the coal is otherwise good. The erection of smelters on Prince Williams Sound will cause an immediate demand for this coal. No smelters have as yet been constructed and none will be probably until the coal and copper can be brought together. The exploitation and commercial development of its ores will promptly follow the construction and operation of smelters.

In connection with possible harbors for the shipping of coal from these fields, Mr. Fisher comments on the much agitated question of Controller Bay. The bay is enclosed partly by rocky remnants of the hills and partly by low reefs built up of mud brought down by glacial streams and raised above the water surface by action of the waves. The bay itself is gradually being silted up by similar material from the same extensive glaciers which border the coal fields on the north and east and probably cover many beds of coal. The entire bay is shallow except a narrow irregular channel from a few hundred yards to a mile in width and a few fathoms in depth lying southward and westward to the sea. This channel lies two or three miles out from the shore, with shallow mud flats intervening. To develop the harbor it will be necessary to construct piers or roadways from the shore out over the shallow flats to the channel. On the whole, Mr. Fisher

does not look with favor on Controller Bay as a favorable point for the terminus of the railroad to carry coal from the Bering field. He considers Cordova a much more favorable location.

The Matanuska coal field is larger in extent than the Bering field. It has an area of seventy-four square miles, or 47,360 acres. The coal is better in physical condition and freer from the competition of private claims than is true of the Bering River. Against these advantages must be set off its greater distance from the sea. The field lies north of Prince Williams Sound and from 150 to 200 miles from Seward on Resurrection Bay. It is known to contain extensive beds of coal of the same quality as, or slightly superior to that of Bering River, and is in better physical condition both as to the coal itself and as to the obstacles to profitable mining. A far smaller percentage of the field has been entered by private claimants and most of these claims appear to be clearly illegal on account of dummy entries and other violations of the law, for which indictments are now pending. A railroad has been started from Seward to develop this field and open up the great interior valleys which are covered with luxuriant grasses and can be made to raise cattle and sheep and even grain, under certain conditions. Seward possesses an excellent harbor, landlocked and free from ice and already selected by the government as a naval coaling station. The railroad from Seward, the so-called Alaska Central or Alaska Northern, extends only seventy-one miles to a point on Turnagain Arm, where it stopped for lack of funds and for various other reasons. Mr. Fisher believes that this road should be continued on to the coal field by the government if no other means are available. No large financial interests are back of the railroad and no large investments have been made which it will be necessary for private interests to protect. He believes that those interested in the railroad will sell it to the government for the face of the outstanding bonds, which amount to \$4,600,000.

Secretary Fisher considers somewhat in detail the methods by which the coal fields in Alaska may be opened. The methods suggested have been the sale of the lands in fee, their development under lease from the government, and their operation by the government itself. He believes that the time is past when the government should convey an unrestricted title to its coal fields. To impose effective regulations upon enterprises after they have passed to private individuals in fee is exceedingly difficult if not impossible. The ownership of the fee carries with it under the law the right of unrestricted sale and many regulations which are desirable in the public interest can be imposed, if at all, only after radical changes in the laws and prolonged litigation in the courts, perhaps only after constitutional amendments. On these grounds, therefore, it is unnecessary in his opinion to sell the coal lands in order to secure their effective development. Government operation, on the other hand, including the mining and selling of coal, involves such deep and far-reaching changes both of policy and of administration that there is no likelihood at the present time of its adoption to the exclusion of private operation. Unlike government ownership of railroads, public coal mining has never been held by the courts to be a function of the government.

It would be regarded by many as an invasion of the field of private enterprise and would involve such general and uncompromising opposition that even those who believed in its adoption as a matter of principle should not insist upon tying up the coal fields of Alaska until the great economic and political questions that are involved in its exclusive application to these fields have been fought out to a practical conclusion. Mr. Fisher believes that the leasing system avoids the controversies and difficulties of both extremes of public and private ownership. It has been adopted with conspicuous success in the great mining communities of Australia and New Zealand. It is also the established law of the Yukon territory lying in Canada, just across the border line from Alaska. Under it much of the privately owned coal land of the United States is to-day being developed. Under the operation of this system can be inserted as matters of contract and as conditions to which the lessee voluntarily consents, those regulations and requirements which promote the public interest, the enforcement of some of which by mandatory law might be unconstitutional. Instances are cited by Mr. Fisher of the successful operation of the leasing system in foreign countries and in Wyoming, Colorado, and other States. The practical difficulty in operating the coal fields in Alaska at the present time is the fact that under the existing laws it is impossible for operators to obtain a sufficient area of coal land to make its operation profitable. While Mr. Fisher found in Alaska strong opposition in certain quarters to the leasing system, on careful presentation of the question to those who opposed it, the objections were, for the most part, withdrawn. While he was at Cordova he was presented with a series of resolutions adopted by the Cordova Chamber of Commerce expressing its disapproval of the leasing system for the coal lands. After his return from Alaska he received from the same chamber a statement to the effect that that body did not desire to be considered as opposed to the leasing system. Similar assurances were also received from the Seward Commercial Club and other bodies both in Alaska and in the United States.

Secretary Fisher expressed himself as greatly pleased with the fair-mindedness and public support of the Alaskan people on the subject. He believed that back of their naturally great and justifiable desire for immediate action they want done in the matter whatever will in the end prove best for the nation as a whole, without regard to special individual or corporate interests.

On May 5, a so-called riot occurred at Cordova, during which a quantity of coal was thrown from the dock of the Alaska Steamship Company as a protest against the government's ignoring the demands of the people of Alaska that the coal lands of the Territory be opened up. Governor Clark took measures to suppress the violence. Later reports indicated that the accounts of the affair as originally printed in the newspapers were greatly exaggerated. The demonstration really amounted to but little.

A federal grand jury on March 16 in Chicago returned indictments against A. C. Frost, promoter of the Alaska Central Railway, and eight men associated with him on charges of conspiracy to obtain title by fraud to more than 10,000 acres of coal lands in the Matanuska district.

ALBERT I. See **BELGIUM**.

ALBERTA. A province (since September 1, 1905), of the Dominion of Canada. Capital, Edmonton (population, preliminary figures, census of June 1, 1911, 24,882). Area, 253,540 sq. miles; population (final, 1911 census), 374,863. The lieutenant-governor (in 1911, and since September 1, 1905, George Hedley Vicars Bulvea) is appointed by the governor-general of Canada. He is aided by an executive council (a responsible ministry of four members) and a legislative assembly (forty-one members elected for five years). Premier in 1911, A. L. Sifton. See **CANADA**.

ALBRO, ADDIS. An American Methodist Episcopal clergyman and author, died October 15, 1911. He was born in Middleburg, N. Y., in 1855, and was educated at Lawrence University. He studied law at the Albany Law School. In 1881 he was ordained to the ministry and held pastorates at Moline, Ill., and Utica, N. Y. He was at one time chaplain of the New York State Senate and was later secretary of the New York State Sabbath and American Reform associations. He contributed articles to encyclopædias and was the author of *The History of Our Country's Flag* and was editor of the *Reform Magazine*.

ALCOHOL. The apparent relation between total abstinence and longevity is shown in the seventieth annual report of the United Kingdom Temperance and General Provident Institution. The figures show that in the general section the expected mortality for the five years 1906 to 1910 was 2282 and the actual mortality was 1900, while in the temperance section, confined to total abstainers, the expected mortality was 2291 and the actual mortality only 1504. The surplus allows of a bonus on policies of 2.1 per cent. in the temperance section and 1.7 in the general section. The report of the Sceptre Life Association shows a similar result favorable to total abstainers. For the twenty-seven years, from 1884 to 1910, the expected deaths in the general section were 3352 and the actual deaths 2674—79.7 per cent. In the temperance section the expected deaths were 2311 and the actual deaths 1124, or 52.5 per cent. The figures of the temperance insurers are not only better over the whole period, but for every quinquennium since 1893 they show an increasing superiority. Thus for the quinquenniums 1894-1898, 1899-1903, 1904-1908, and the two years 1909-1910, the percentage which actual deaths form of expected deaths were in the general section 79.3, 76.9, 80.8 and 80.9, while in the temperance section there were only 54.4, 52.5, 48.4 and 48.4; so that while the mortality in the general section shows no decline, the mortality in the temperance section exhibits a steady fall from 1894 to 1908. This is attributed to a larger number of the assurers in the temperance section being life abstainers and to an increasing number being the children of abstainers.

The relation of alcoholism to crime is demonstrated by Dr. Gerö, a medical expert attached to the Vienna law courts, who examined ninety-four individuals charged with homicide or at-

tempted homicide. In this number there were six malingerers and four persons who were wrongfully supposed to be the subject of mental defects. Of the remaining eighty-four criminals, seventy were males and fourteen females. With regard to their state of health, the following conditions were noted: One case of pregnancy with mental derangement, one case of morphinomania, one of hysteria, nine of delusions, seven of various states of mental disorder, eight of hysteria or epilepsy, thirteen of various diseases either supposed or known to have an effect on the brain, ten cases of mental defect, and thirty-four cases of alcoholism. Gerö emphasizes the fact that the cases of alcoholism thus formed more than one-third of the total number of persons charged with homicide. The influence of alcohol as a contributory cause of homicide would seem to be even greater if instead of a mere enumeration of accused individuals personally addicted to alcohol, an examination were made of the antecedents; this would show that many epileptics and mental defectives were the children of alcoholic parents.

The connection between alcohol and misdemeanors in the German army and navy is shown by some interesting facts recently published. The offenses committed from drunkenness against military discipline in the army have ranged from 9.6 to 12.5 per cent. of the total misdemeanors in the last ten years, and in the navy from 11.1 to 22.3 per cent. This does not include slight infractions of military order. Of the most serious offenses against military discipline (actual attack, mutiny, insubordination) about three-quarters are due to the clouding of the consciousness by alcohol. See **EPILEPSY**; **INSANITY**.

WOOD ALCOHOL. The committee appointed by the American Medical Association to investigate the question of blindness produced by wood alcohol was able to find a list of over three hundred cases of blindness and death which had occurred in the United States from the drinking or inhalation of methylated spirits. Two cases of poisoning from the inhalation of varnish fumes have been reported. These occurred in two men who had been stricken simultaneously after working as beer vat varnishers. One of the men died and one was totally blinded. The cases were undoubtedly due to breathing the fumes of wood alcohol, this being one of the chief ingredients used in the varnish for beer vats. So strong are the fumes, that while these huge containers are being varnished it is necessary to employ a watchman to keep all lighted cigars and cigarettes outside the danger zone—ten feet in most instances. The committee urges the substitution of a cheap commercial grain alcohol that has all the advantages of purified wood alcohol and which has no deleterious effects on those who work with it. They report that in European countries such alcohol is used entirely for industrial purposes. In Germany alcohol is denatured completely or incompletely according to the purpose for which the spirit is to be used. Complete denaturation is accomplished by adding to every 100 liters of alcohol 2½ liters of standard denaturizer made of 4 parts of wood alcohol, 1 part of pyridin, a coal-tar product, and 50 grains to each liter of oil of rosemary or lavender. A slightly different method consists in adding to every 100 liters of alcohol 1¼ liters of the standard denaturizer

and 2 liters of benzol. Incomplete denaturation is employed where the alcohol is to be used for the special purposes for which the completely denatured spirit would be unsuitable. The process is such as to render the spirit unfit for drinking and varies according to the purpose for which it is to be used; for instance, for the manufacture of varnishes and inks, the alcohol is denatured by the addition of oil of turpentine or of animal oil. Alcohol for the manufacture of soda soaps is denatured with castor oil. Denatured alcohol is used in the manufacture of celluloid and pegamoid. Alcohol for the manufacture of ethers, aldehyde, argacin, white lead, bromo-silver, gelatines, etc., is denatured by the addition of sulphuric ether, benzol, oil of turpentine, or animal oil. Wood alcohol poisoning, however, is not unknown in Europe. Dr. Filletar, director of the public analytical offices in Budapest, discussed some recent cases of poisoning by wood alcohol. He said that the majority of these victims were of alcoholic habits and had taken to drinking the methyl spirit either from a liking for it or as a substitute for unattainable ethyl alcohol. The fatal dose in these cases was half an ounce. One of the patients was poisoned by inhalation of the vapor, and another by absorption through the skin. These were workmen in a distillery. The most constant symptoms of poisoning are mild intoxication, followed by severe headache, gastric pain, retching, dilatation of the pupils, and partial or complete blindness. In the most serious cases, this sequence was followed by dyspnea, coma, with stertorous breathing and death. The toxic amblyopia is the most constant and important symptom. Even when recovery takes place, atrophy of the optic nerve is likely to follow and permanent blindness results. See CHEMISTRY, INDUSTRIAL.

ALDRICH, NELSON WILMARTH. See BANKS AND BANKING.

ALEXANDER, BOYD. See EXPLORATION.

ALEXANDER, WILLIAM. An Irish Anglican prelate, Archbishop of Armagh, and Primate of All Ireland, died September 12, 1911. He was born in Derry, Ireland, in 1824 and was educated at Tunbridge School, Kent, and Exeter and Brasenose colleges, Oxford, graduating from the latter in 1847. He was soon afterwards ordained a deacon and in 1850 he was appointed rector in County Tyrone, Ireland. After serving as rector in several parishes he was made, in 1864, Dean of Emlay. He was consecrated Bishop of Derry in 1867 and remained identified with this diocese for the next thirty years. He became known as an able administrator, a learned contributor to theological literature, and a great preacher. In 1896 he was appointed Archbishop of Armagh to succeed Dr. Robert Gregg. Dr. Alexander took a keen interest in the church in the British possessions. In 1892 he visited South Africa and in the following year delivered a course of lectures in New York on *Evidences of Christianity*. These addresses, along with some others, delivered at Harvard University, formed the substance of one of his last books, entitled *Primary Convictions*. In addition to his work as theologian, the archbishop wrote poetry of considerable merit. His chief reputation, however, was gained as a preacher. In some respects he was the most

brilliant of the preachers of his day. He did not take a great interest in politics, but opposed Mr. Gladstone's Home Rule bill of 1893 in a great oration delivered at Albert Hall. Among his published writings are *Discourses on Epistles of St. John*; *Commentaries on Epistles to Colossians*; *What Think Ye of Christ?* and other sermons, *Leading Ideas of the Gospels*, *Witness of the Psalms* and *The Finding of the Book and other Poems*.

ALFALFA. Although rather drought resistant, the alfalfa crop was nevertheless reduced by the droughty conditions prevailing in many parts of the world in 1911. Comparative data on the production of alfalfa are not generally available, as most countries include the production under hay of all kinds. Germany, which reports separately on alfalfa, produced this year 1,203,500 tons, the average yield being only 2.01 tons per acre, as compared with a production of 1,930,000 tons and an average yield of 3.05 tons per acre in 1910. In the United States the crop was much reduced by dry weather, and in the Western States, where it is most extensively grown, the first cutting was much below the average, and many farmers allowed the crop to go to seed instead of cutting it for hay. Data with reference to the crop in the different States for 1910 and 1911 are not available, but figures are given in the table on the opposite page for 1909. These statistics were collected by the Thirteenth Census, and they are the first general data on the crop in the United States. The States are arranged in the order of their alfalfa hay production.

ALGERIAS. See MOROCCO, *History*.

ALGERIA. A French colony (administratively an integral part of the French Republic) on the northern coast of Africa. Capital, Algiers.

AREA, POPULATION, ETC. Total area, 505,769 square kilometers (area by departments: Algiers, 54,205 square kilometers; Constantine, 87,434; Oran, 59,613—total Algeria proper, 201,252; Southern Territories, 304,517). Total population in 1906, 5,231,850; census of 1911, 5,563,828: Algiers, 1,720,881; Constantine, 2,118,446; Oran, 1,230,195—Algeria proper, 5,069,522; Southern Territories, 494,306. The total native population was 4,768,306; European, 795,522. Marriages (1909), 33,699 (Europeans, 5342); births, 143,840 (20,845); deaths, 110,760 (13,694); still-births, 2002 (676). Algiers had (1906) 154,049 inhabitants; Oran, 106,517; Constantine, 58,435; Bone, 42,934.

Primary and infant schools numbered (1907) 1358, with 3489 teachers and 159,581 pupils; Mussulman, 286 (no returns for pupils); secondary, 21 (5802 pupils); normal, 4 (259). There are higher Mussulman schools and a European professional college at Algiers.

PRODUCTION. Area under principal crops and yield are shown below for two years (1911 preliminary), with yield per hectare in 1910:

	Hectares		Quintals		Qs. per ha.
	1910	1911	1910	1911	
Wheat	1,386,770	1,337,411	10,716,112	9,959,934	7.7
Rye	1,472	636	15,876	851	19.8
Barley	1,383,464	1,360,500	10,605,022	10,399,613	7.7
Oats	163,745	181,411	1,924,455	1,755,092	11.8
Corn	14,594	8,911	140,119	85,573	9.6
Vines*	126,386	150,486	8,413,654	8,443,368	66.6

* Yield in hectoliters.

ACREAGE AND HAY AND SEED PRODUCTION OF ALFALFA IN 1909, AS PUBLISHED BY THE THIRTEENTH CENSUS.

States	Area Acres	Hay Tons	Seeds Bushels	States	Area Acres	Hay Tons	Seed Bushels
Kansas	955,470	1,995,571	49,670	Arkansas	15,928	33,231	24

Indiana	17,898	40,320	Rhode Island	34	78
Kentucky	20,229	37,978	64	Florida	49	63
				United States	4,702,202	11,849,998	259,586

Iron, copper, quicksilver, zinc, and lead mines are worked. Value of output (1907), 21,634,043 francs. Value of phosphate produced, 11,216,500 francs. Fisheries production, 3,865,730 francs.

COMMERCE AND COMMUNICATIONS. The value of the special trade is shown below for four years in thousands of francs:

	1907	1908	1909	1910
Imports	448,200	449,300	462,000	507,800
Exports	338,500	319,200	359,200	493,300

Principal articles of export (1909) are seen below:

Exports	1000 fr.	Exports	1000 fr.
Wine	36,223	Phosphates	10,336
Cereals	50,765	Iron ore	10,254
Animals	37,944	Skins	9,376
Wool	13,745	Tobacco	7,850
Cork	11,262	Esparto	5,872
Fruits	11,114	Legumes	5,502
Zinc	10,781	Olive oil	3,317

France contributed imports and received exports (1909) valued at 397,108,000 and 271,966,000 francs respectively; Great Britain, 13,870,000 and 15,925,000; Morocco, 7,964,000 and 6,779,000; United States, 6,515,000 and 3,638,000. Vessels entered (1909), 4724, of 5,158,137 tons (2116, of 2,250,234 tons, French); cleared, 4867, of 5,424,847 (2175, of 2,356,771, French). Merchant marine (Jan. 1, 1910), 961 vessels, of 31,443 tons (steamers, 105, of 21,246 tons).

Railways in operation (Dec. 31, 1910), 3297 kilometers main and 150 kilometers local lines. Telegraph lines, 15,062 kilometers; wires, 39,257; number of offices, 708; post offices, 650.

FINANCE AND GOVERNMENT. The monetary unit is the franc, worth 19.3 cents. Revenue and expenditure in 1908, 115,186,178 and 108,078,035 francs respectively. The 1911 budget is as follows:

Revenue	1000 fr.	Expenditure	1000 fr.
Indirect taxes	40,176	Interior	24,959
Direct taxes	13,767	Pub. works	21,540
Monopolies, etc.	8,969	Debt	17,054
Domains	7,922	Posts and tels.	10,885
Receipts d'ordre.	26,624	Finance	9,222
Various	2,556	Agriculture, etc.	8,323
Extraordinary	44,535	Native affairs	5,675
		Internal gov't	2,079
Total	144,549	Various	275
		Extraordinary	44,535
		Total	144,547

The 1911 budget for the Southern Territories showed revenue, 5,615,244 francs; expenditure, 5,608,353. Communal debt (end of 1907), 67,440,036 francs.

Algeria is administered by a governor-general (1911, M. Lataud), aided by a consultative council. The legislative authority rests in the French Chambers.

ALIENS. See IMMIGRATION.

ALLEN, AMOS LAWRENCE. An American public official, member of Congress from Maine, died February 20, 1911. He was born in Waterborough, Me., in 1837. He graduated from Bowdoin College in 1860. He studied law at Columbian (now George Washington) University, and was admitted to the bar in 1866. For three years he was a clerk in the United States Treasury Department and from 1870 to 1883 was Clerk of Court of York county, Me. He served as a clerk in the House of Representatives, and in the Pension Bureau from 1883 to 1885. In 1886-7 he was a member of the Maine House of Representatives. In 1893 he became private secretary to Thomas B. Reed and served in that capacity until 1896. He was elected to the 56th Congress in 1899 to fill the vacancy left by the resignation of Mr. Reed. He was reelected from the 57th to the 61st congresses but declined to be a candidate for the 62d Congress.

ALLEN, ETHAN. An American lawyer and soldier, died December 7, 1911. He was born in Monmouth county, N. J., in 1832 and was the

grand-nephew of Ethan Allen of revolutionary fame. For several years he served as Washington correspondent for the New York *Herald* and resigned this position to enter Brown University, from which he graduated in 1859. He then studied law at the New York University Law School, graduating in 1860, and at once began the practice of law. In the campaign of 1861 he supported Abraham Lincoln, and in the same year was appointed assistant United States district attorney. He resigned to accept a commission as colonel, and organized and equipped Blair's Brigade, at the head of which he went to the Civil War. After the war he resumed the practice of law. In 1872 he joined the Liberal Republicans and managed Horace Greeley's campaign for the Presidency. He also organized the Cuban League of American Sympathizers in 1870, reviving it in 1896 and continuing it until the end of the Spanish-American War. In 1890 he retired from the active practice of law. He was the author of *Washington, or the Revolution* (a history of the American Revolution in dramatic form, blank verse), and *Rozina*, a society drama.

ALUMINUM. The consumption of aluminum in the United States in 1910 was 47,734,000 pounds. This practically represents the production of that year. The growth in the production and consumption may be seen by comparing the figures for the preceding years. In 1907, 17,211,000 pounds were consumed; in 1908, 11,152,000 pounds, and in 1909, 34,210,000 pounds. From the beginning of production in 1883 the total amount produced and consumed is 193,626,779 pounds. The year 1910 was one of progress in the industry, taken as a whole, but particularly so in that branch of the industry having to do with the processes of manufacture and new applications of the metal. Many inventions were patented relating to almost all branches of the metallurgy of aluminum and its use in alloys. The exploitation of the aluminum-process patents and the great increase in the output of that metallic aluminum have given rise to many scientific researches and commercial inquiries regarding new methods for its production. Aluminum silicates are found almost everywhere and the problem is to separate the silica from the aluminum. An important invention has recently been patented by F. J. Tone, having for its object the production of silicon from kaolin and the formation of pure alumina as a by-product. The exports of aluminum from the United States in 1910 were valued at \$949,215, as compared with a value of \$567,375 in 1909, and \$330,092 in 1908. The use of aluminum, particularly in aluminum tubing, and paper, chemical, and other similar lines of manufacturing, has made steady growth in recent years. The use of aluminum in extruded shapes has also been constantly increasing. The metal continues to be more widely used each year in the manufacture of cooking utensils. See CHEMISTRY, INDUSTRIAL.

AMERICAN TOBACCO COMPANY. Exactly two weeks after its decision of the Standard Oil case (q. v.) the United States Supreme Court handed down the decision requiring the dissolution of the tobacco trust. Suit against this combination was begun in the Circuit Court for the Southern District of New York in July, 1907. In the decision of that court in November, 1908, one of the four judges dissenting, the court held the combination to be illegal under the Sherman law, but it also held that "the evidence fails to show that defendants have practiced unfair or offensive methods" and that "they have not in fact injured commerce." In other words the Circuit Court held the combination illegal because the Sherman act prohibited, even in greatest detail, all contracts which restrained trade or competition. Both parties appealed to the Supreme Court, before which the case was presented in January, 1910. Unusual circumstances (see STANDARD OIL) delayed decision until May 29, 1911.

This case involved twenty-nine individual defendants, sixty-nine American corporations, and two English corporations. The decree of the court not only swept away the interpretation of the anti-trust law by the lower court, but, also, reversed its interpretation of the facts. The higher court found the Tobacco Trust unlawful "not only because of the dominion and control over the tobacco trade which actually exists," but because "the conclusion of wrongful purposes and illegal combination is overwhelmingly established by the undisputed facts of the evidence."

The court reviewed the history of the combination. It pointed out that during sixteen years, from 1890, continuous and unrelenting efforts had been made to effect a close consolidation and control of the tobacco business; and that this had been attended by "fierce and abnormal" competition. Thus in a single year (1908) the company suffered a deliberate loss of four million dollars in order to ruin or coerce obstinate rivals. This particular war involved control of the plug tobacco trade and resulted in the formation of the Continental Tobacco Company with seventy-five million dollars capital. In this branch of the business, as in others, many plants were bought only to be permanently closed. Similar circumstances attended the acquisition of control over the snuff branch of the industry. Since 1904 the company was believed to have as complete a monopoly as is

possible in any large modern business. It had control, not only of the market in cut tobacco and plug tobacco, cigarettes, chewing tobacco, and snuff; but it engaged in the licorice business and the manufacture of tin foil; it made boxes, briar pipes, and smokers' supplies; and otherwise showed an undoubted determination to control all business in any way within its sphere of influence. In the entire process of consolidation the court declared that deceit and concealment were used and statements made designed "to mislead, deceive and defraud the public and more effectually to cripple existing competitors and keep out new ones." It recounted how the combination had in some localities reduced prices below the cost of production in order to drive out a competitor; and elsewhere had raised the price of raw tobacco to such a point that other competitors were stifled.

Coming to the interpretation of the law the court said: "Although it was held in the Standard Oil case that, giving to the statute a reasonable construction, the words 'restraint of trade' did not embrace all those normal and usual contracts essential to individual freedom the right to make which was necessary in order that the course of trade might be free, yet, as a result of the reasonable construction which was affixed to the statute, it was pointed out that the generic designation of the first and second sections of the law, when taken together, embraced every conceivable act which could possibly come within the spirit or purpose of the prohibitions of the law, without regard to the garb in which such acts are clothed." That the undisputed acts performed by this company were prohibited by the statute was deemed by the court too clear for argument. Thus it held "the history of the combination is so replete with the doing of acts which it was the obvious purpose of the statute to forbid, as shown by its manifest purpose to acquire monopoly by its unusual and ruthless methods of driving competitors out of business that the conclusion is inevitable that wrongful purposes and illegal combinations are overwhelmingly established."

The court then laid down as guides for its action: (1) The duty of giving complete and efficacious effect to the prohibitions of the statutes; (2) the accomplishing of this result with as little injury as possible to the interests of the general public, and (3) a proper regard for the vast interests of private property." Having made a sweeping condemnation of the consolidation, the court took special pains to insure the carrying out of its decree in such a way that the spirit of the Sherman law should be complied with. The decree was as follows: "(1) That the combination in and of itself, as well as each and all of the elements composing it, be decreed to be in restraint of trade. (2) That the court below be directed to hear the parties, for the purpose of ascertaining and determining upon some plan or method of dissolving the combination and of recreating a new combination which shall be honestly in harmony with and not repugnant to the law. (3) That for the accomplishment of these purposes a period of six months is allowed with leave to extend such period to a further time not to exceed sixty days. (4) That in the event, before the expiration of the period thus fixed, a condition of disintegration in harmony with the

law is not brought about, it shall be the duty of the court either by way of an injunction or by the appointment of a receiver to give effect to the requirements of the statute."

DISSOLUTION. The reorganization of the Tobacco Trust was, in several respects, more difficult than that of the Standard Oil Company. The latter was a simple holding company, whereas the American Tobacco Company not only included holding companies, within a holding company, but (a) to a considerable extent it owned properties and conducted business directly; (b) in some cases it controlled former independents on contracts not to compete; and (c) in other cases it controlled trade by contracts for the division of business between it and its former competitors. The extent of its control over the various branches of business is approximately indicated by the following percentages: Cigarettes 81 per cent., smoking tobacco 78 per cent., plug tobacco 82 per cent., fine cut 79 per cent., cigars 13 per cent., snuff 90 per cent., and little cigars 93 per cent. The plan for the dissolution of the trust, as prepared by the attorneys for the company, was modified in various respects before the issue of the final decree late in October, setting forth the approved plan of reorganization. This plan provided for the recreation of the American Tobacco Company and the formation of two new companies to be known as the P. Lorillard Company and the Liggett and Myers Tobacco Company. These three, with their J. B. Reynolds Tobacco Company, were to control the domestic business of the trust in the manufacture of smoking and chewing tobacco, cigars, and cigarettes. The plan provided for the issue of new securities by the two new companies and set forth the ratios of exchange which would prevail between the bonds and preferred stocks of the trust and bonds and preferred stocks of the new companies. Thus the stock of the Reynolds Company was to be directly distributed to the common stockholders of the trust. The common stock of the Liggett and Myers and the Lorillard companies was to be sold at par for cash to the same stockholders. The holders of the 6 per cent. bonds of the trust were to exchange them one-half at 120 for cash and the other half at par for the 7 per cent. bonds of the two new companies; and holders of the 4 per cent. bonds of the trust were to exchange them one-half at 96 for cash and the other half at par for the 5 per cent. bonds of the new companies. The cash thus needed to retire the trust bonds were to be derived from the proceeds of the sale of common stock of the two new companies as already noted. The reformed American Tobacco Company would thus have no funded debt but would have \$52,459,400 preferred and \$40,260,000 common stock. Though the common stockholders in all companies would be the same at first, each stockholder having an equal share in each of the four principal concerns, this was expected to be changed soon by the disposal and recombination of many of the part shares into which the stocks had to be split to effect the distribution. The decree limited to 40 per cent. the proportion of any business to be controlled by any one of those concerns. It enjoined the twenty-nine principal "insiders" from increasing their stock control within five years.

The decree provided for the separation of ten other companies. Thus it ordered the distribution to trust stockholders of the stocks of the

American Snuff Company and its two subsidiaries, the George W. Helme Company and the Heyman & Bruton Company; of the Conley Foil Company and its subsidiary, the Johnston Tin Foil and Metal Company; and of the MacAndrews and Forbes Company (licorice paste manufacturers) and its subsidiary, the J. S. Young Company, all owned by the trust. Similarly, were to be distributed two-thirds of the stock of the United Cigar Stores Company, the stock of the Porto-Rican-American Tobacco Company and the two-thirds of the stock of the British-American Tobacco Company owned by the trust. Certain other companies passed through more complicated transfers and dissolutions. The contracts between the trust and the British Imperial Tobacco Company and the British-American Company, whereby they were prevented from invading the American market, were terminated.

The court held that it could not grant the government power to intervene at any time within five years, as was asked by Attorney-General Wickersham. It did, however, prohibit loans by one company to another and ordered the preservation of the books of the American Tobacco Company for use in case of further litigation.

The attorneys of the trust admitted that the four companies among which the large domestic business was to be divided had stockholders in common. It was not believed by the government experts in the tobacco industry, nor by independent tobacco concerns, nor by financiers that the reorganization would have any appreciable effect on the monopolistic control of the tobacco industry, because the stock control of the various principal concerns was left in the same hands. The independents felt sorely grieved at the outcome. They had in various ways endeavored to have the case re-opened; or to have the court decree modified so as to bring about a more effective widespread dispersion of control. The Circuit Court dismissed these petitions, principally on the ground that the independent companies, not being parties to the main suit, were not entitled under the law to become parties to a petition for a rehearing. The independents then demanded a modification of the Sherman act so as to give independent competitive concerns certain rights of action in proceedings under that law. Such an amendment was before the Senate Committee on Interstate and Foreign Commerce at the close of the year; this was, in fact, designed to permit the independents to appeal from the decree dissolving the trust.

REPORT OF BUREAU OF CORPORATIONS. This bureau had been conducting an extensive inquiry into the history, organization, and monopoly power of the Tobacco Trust for many months. In a report issued early in October, Commissioner Herbert Knox Smith set forth the amounts of the different branches of the tobacco business in this country controlled by the combination, these being about the same as the percentages given above. The profits for the four years 1904-8 were shown to be \$31,250,000, or nineteen per cent. on the capitalization. The report showed that the stock of the Snuff Company, originally all water, paid twenty-seven per cent. dividends, this being mainly due to the monopoly power obtained through the control of ninety-six per cent. of the snuff trade; in the smoking-

tobacco branch profits increased to fifty-five per cent. in 1908; but in the cigar branch profits never went above nine per cent. The commissioner pointed out that prices were raised after the Spanish-American War taxes were imposed, but were not lowered after the war taxes were removed. He laid great stress also on the excessive over-capitalization of the combination. He estimated that not less than \$84,000,000 out of \$148,000,000 entered into the capitalization as "good will" was beyond any doubt excessive capitalization. Moreover, he stated that by skillful and frequent readjustment of the securities of the combination a relatively small inside group had been able to secure for themselves a very large part of the earnings.

AMHERST COLLEGE. An institution of higher learning at Amherst, Mass., founded in 1821. The number of students enrolled in the several departments of the college in 1910-11 was 465. The faculty numbered 47. There were no notable changes among the members of the faculty during the collegiate year. Benefactions to the amount of \$420,000 were received, and the productive fund amounted to \$2,200,000. A dormitory, given by Mr. and Mrs. Charles M. Pratt, as a memorial to their son, Morris Pratt, was in process of erection during the year at a cost of \$150,000. Considerable discussion arose from the decision of the college in regard to classical studies. The class of 1885 issued an address on the subject, which attracted wide attention. For a discussion of the matter, see **UNIVERSITIES AND COLLEGES**. The library contains about 100,000 volumes. The president in 1911 was George Harris, LL. D.

ANÆSTHESIA. Very few new methods of administering general anæsthesia were introduced during 1911, greater attention being paid to developing a safe technic by the ordinary methods. Hagemann, however, reviews the experiences at the König surgical clinic in Greitawald, with intravenous injections of ether. Eleven cases were thus anæsthetized. This technic was used in patients requiring operations on the mouth or face or on account of extreme weakness. The ether was prepared by mixing with cold water and gradually warming over the water bath to 100.4 F. and keeping the fluid at this temperature until all excess of ether evaporated and a 4.68 per cent. solution was obtained. From 1050 to 3925 c.c. of the solution were infused. There was no sign of thrombosis or embolism and Hagemann thinks the method is free from danger. The infusion of such large amounts of fluid was found to be of great advantage in much debilitated patients. The pulse was never weaker, but often stronger after the anæsthesia, and there was no thirst. Gwathmey of New York has devised an inhaler by which ether anæsthesia can be robbed of all unpleasant effects. Its vapor is first passed through cold water, which washes out the aldehydes, and then it is passed through water of the temperature of the body. When administered in this way to a patient already anæsthetized by nitrous oxide

gas, subsequent nausea is of very rare occurrence.

ANAPHYLAXIS, or SERUM SICKNESS. This phenomenon was first remarked in 1903, by Dr. Theobald Smith, of Boston, in certain individuals after repeated doses of antitoxin. As the result of a great amount of work devoted to the subject, anaphylaxis is now considered merely a phase of immunization and is being used to explain other more obscure phenomena of disease. The *Journal of the American Medical Association* summarizes the present conception of anaphylaxis as follows:

"On the introduction of the first dose of a foreign proteid into an animal, there occurs a gradual increase of the antibodies for this substance—antibodies already present in small amounts normally. If, now, after a suitable interval, say from eight to ten days, a second dose be given, these antibodies, now present in increased quantities, produce a rapid disintegration of the proteid, with liberation of toxic products. If the animal survives this sudden liberation of poisonous material, farther cleavage of these products rapidly renders them innocuous.

"Such a hypersensitization to foreign proteids is peculiar in that for the most part it is necessary to introduce them by some route other than the alimentary canal. When, however, we consider the great breaking up undergone in the process of digestion, it will be readily seen that any characteristic peculiar to a given proteid would ordinarily be so modified before absorption as completely to alter any toxic effect that it might possess. Indeed, the anaphylactic reaction is believed to be due to a splitting up of the proteid into exactly the products it would yield in intestinal digestion; the poisonous intermediate products, however, which in the latter case would undergo still farther cleavage before entering the system, are in the former liberated directly into the blood-stream, and so are free to exert their toxic action. In support of this view is the fact that in those cases in which there is excessive antibody formation, the acute anaphylactic reaction is diminished or absent; the probable explanation being that the breaking up of the proteid into its ultimate constituents is so rapid as to prevent the accumulation of toxic intermediate products in quantities sufficient to do harm. Idiosyncrasy to articles of food is to be explained, on this basis, by the absorption of sufficient unmodified proteid to react with antibodies already present, either congenitally or formed under similar previous conditions. In addition to the "active" anaphylaxis, produced by the direct administration of sensitizing doses of proteid to the animal organism, it is possible to produce "passive anaphylaxis" by transferring hypersensibility to other animals with the serum of treated animals. This so-called passive anaphylaxis belongs to the same class as passive immunization. Further analogy is shown by the necessity of free complement to produce the reaction. If an animal be given its second dose of proteid, in nonlethal amount, at an interval greater than the ten days at which hypersensitization reaches its height, the excess of antibodies present becomes bound, and the animal becomes relatively free from further reaction. This is the so-called anti-anaphylaxis."

ANARCHISTS. See JAPAN, *History*.

ANDRADE, CIPRIANO. A rear-admiral, re-

tired, of the United States navy, died June 19, 1911. He was born at Tampico, Mexico, in 1840 and was educated in public and private schools in Philadelphia. He studied engineering and in 1861 was appointed third assistant engineer in the United States navy. He served throughout the Civil War, rising to the rank of first assistant engineer. In 1881 he was promoted to be chief engineer with the relative rank of commodore. He was made captain in 1898 and rear-admiral and retired in 1901. He took part in various engagements in the Civil War and afterwards in active service as engineer officer of the navy. He took part in the Spanish-American War. He was a member of many military and scientific societies.

ANGELL, HENRY CLAY. An American ophthalmologist, died May 27, 1911. He was born in 1830 and graduated from the Hahnemann Medical College in 1853 and after three years of study in Vienna began practice as an eye specialist in Boston. He was for twenty years professor of ophthalmology in the Boston University Medical College. He was the author of several technical works on the eye. He was interested in music and in 1882 was president of the Philharmonic Society.

ANGOLA. A Portuguese colony in western Africa. Estimated area, 500,000 square miles, divided into the districts of Congo, Loanda, Benguella, Mossamedes, Huilla, and Lunda. Population, between three and four millions. Capital, St. Paul de Loanda. Imports (1909), 5,674,861 milreis; exports, 3,485,085; transit trade, 326,349. Vessels entered (1909), 1741, of 1,005,000 tons. Railways open, 821 kilometers; telegraph lines 3708, wires 3989, number of offices 65; telephone lines 654, wires 781; post offices, 436. Revenue (1909-10), 2,321,373 milreis; expenditure, 3,171,373. Governor-general (1911), Lieut.-Col. Alves Rodadas.

At the beginning of November the negroes of the Mexico districts were reported to be in revolt and pillaging the property of the Europeans, and on November 7 the governor announced to the home authorities that he was dispatching a strong force to restore order. See SÃO THOMÉ.

ANKYLOSTOMIASIS. See HOOKWORM DISEASE.

ANHALT. See GERMANY.

ANNAM. A French protectorate in French Indo-China (q. v.). Area, 61,718 square miles. Estimated population, 7,994,425. Capital, Hué (65,000 inhabitants). Paddy, rice, corn, cotton, coffee, timber, rubber, cardamoms, betel, tobacco, etc., are raised; the mines yield kaolin, coal, lead, zinc, copper, iron, gold, and silver. The trade is included with that of French Indo-China. Railways open (1910), 511 kilometers. The local budget balanced (1911), at 2,931,910 piastres. There is no debt. Reigning king (1911), Duy-Tan. French resident-superior, J. H. Groleau (H. Sestier, acting).

ANTHROPOLOGY. The discussions of recent years have culminated in 1911 in a number of significant utterances on the fundamental problems of ethnology. Dr. Rivers' address on *The Ethnological Analysis of Culture* indicates an interesting change of attitude on the part of British ethnologists, inasmuch as this investigator fully recognizes the necessity of detailed historical study before attempting a generalized scheme for the evolution of culture on the basis of psychological similarity the world over. A similar point is urged with even greater emphasis in Dr. Graebner's *Methode der Ethnologie*, where a systematic discussion is given on the logic of ethnological research. Ethnology is treated as a distinctly historical science devoted to the ascertainment and comprehension of individual facts, as opposed to the natural sciences, which seek to formulate general laws and disregard individual variations. The most distinctive feature of the work is the author's insistence that all similarities of culture, with the exception of such resemblances of objects as are a consequence of the material employed in their manufacture, are due to historical connection. Graebner thus rejects both Bastian's theory that cultural resemblances may be due to the psychical unity of mankind and Ehrenreich's principle of convergent evolution. *The Mind of Primitive Man*, by Professor Boas, likewise voices a protest against the theory that there is a general course of cultural development and is to that extent in accord with the position held by Graebner. The main subject of the book, however, is an inquiry into the mental characteristics of primitive man and into their possible correlation with racial differences. Boas dismisses the theory that differences in cultural achievement are founded in hereditary racial differences, because the progress of civilization is dependent on other, historical causes. Similarly, it cannot be shown that the anatomical traits of races with the highest culture are phylogenetically higher than those of people of a lower cultural stage. Psychologically, all the traits popularly denied to primitive humanity—such as inhibitory powers, reasoning ability, or attention—are undoubtedly common to all mankind, though evinced on different occasions by different people. Emotional associations of habitual activities and the invention of rationalistic explanations are characteristic of primitive life. The transition to civilization involves a diminution of the emotional associations. It does not effect a change in the psychologically automatic character of individual activities in conformance with established custom, but rationalizes conduct solely by rationalizing the customs themselves which serve as a norm of action.

PHYSICAL ANTHROPOLOGY. As a result of recent examination of crania of the Southampton Island and the Smith Sound Eskimo, Hrdlicka finds an unexpectedly close relationship between these two branches of the Eskimo people. The type represented by these natives is distinguished by large cranial capacity and a high facial index, the face being extraordinarily large even for the Eskimo. Hrdlicka regards the kind and quantity of food as the main factor in the differentiation of the Eskimo cranial type; this

applies particularly to the great development of the temporal muscles and other muscles of mastication. Climatic agencies probably affected the size of the cranial cavity or brain, as well as the narrowness of the nasal aperture. Owing to the rarity of pronounced dolichocephaly, any considerable blood relation, in recent times, with the Eskimo of Labrador and Lower Greenland seems improbable. Most important of all, Hrdlicka corroborates the view that the Eskimo, as a unit, present no affinities with diluvial or posterior European man, but only with the natives of Asia and America.

OMAHA. Under the auspices of the Bureau of American Ethnology, Miss Fletcher and Mr. La Flesche have published a monograph on *The Omaha Tribe*, which adds considerably to our knowledge of the clubs and secret organizations of this people. Of the former, the most important were the Hethushka and the Pugthon. While the latter embraced only chiefs, anyone might join the Hethushka that had won public war honors. The Thunder was the tutelary deity of this society, and all its members were fastened to the back of their belts a long bunch of grass representing scalp, whence the name of "Grass Dance" under which their performance has become known among other Plains tribes. Several of the secret societies were based on the individual relations of the members to certain animals, entrance being dependent on a supernatural revelation from one of the creatures in question. Two organizations, the Shell and the Pebble society, shared the shamanistic practice of ceremonially "shooting" members by the magic power of the objects for which the societies were named. This trait is of comparative interest as it exhibits a partial resemblance with the Midewiwin of the Central Algonkin and Winnebago. The Shell society also held secret meetings for the purpose of punishing offenders through the power of their magic. A rough representation of the criminal was drawn on the ground and one of the members shot an arrow into the heart of the figure, thus compassing the person's death.

BLACKFOOT. Wissler has given us a study of *The Social Life of the Blackfoot Indians*. In view of the never-ceasing discussions on the nature of the clan and exogamy, Wissler's conclusions on this subject are of general importance, especially as both Grinnell and more recently Uhlenbeck have conceived the Blackfoot bands as genuine exogamous clans. This, according to Wissler, is not the case. To marry within the band is not criminal, but merely bad form. The fundamental idea is that blood relationship should constitute a bar to marriage. If members of the same band not related desire to wed, marriage is permitted, though with some reluctance, owing to the suspicion that they may after all be related by blood in some obscure way. All the bands have nicknames such as occur among neighboring tribes; of totemism not a trace has been found. On the other hand, the band exercises important political and social functions. To a certain extent the band as a unit is responsible for the acts of the individual, and in cases of crime all members are required to contribute to the payment of indemnities and to shield a member guilty of murder. Descent of band name is in the paternal line. The close correlation between bands and a camp circle found among several Plains tribes does not exist among the Blackfoot. Indeed, the camp circle

does not seem to be of fundamental significance, the relative position of the bands is apparently subject to the suggestions of the leading men, and in the Piegan branch the circle was never formed except during the sun dance and related ceremonial observances.

WINNEBAGO. In *The Ritual and Significance of the Winnebago Medicine Dance*, Dr. Paul Radin discusses on the basis of material collected by himself the important ceremony otherwise known as the Midewiwin. He finds that the similarities in the ceremony as found among the Ojibwa, Menomini, Omaha, and Winnebago are reducible to two common features—a shooting ritual and an initiation ritual. The shooting ritual is merely one phase of sympathetic magic, which has entered a different combination in the case of the Winnebago and Omaha societies from that found among the Ojibwa and Menomini. A study of the initiation ritual confirms the difference. While the Central Algonkin initiation is really an individual admission into the status of a shaman rather than an initiation into a society, the Winnebago Medicine Dance requires a definite initiation ritual. This initiation feature, however, must be considered intrusive, as it is lacking in other societies of the same tribe, and has merely been secondarily associated with the basic ritual of the ceremony. As a matter of fact, each of the ceremonial complexes investigated is to a large extent the product of a few features common to all of them with the specific cultural setting of the tribe in question. In the demonstration that ceremonial complexes are largely the result of secondary association lies one of the significant theoretical points of the paper. In addition Radin shows that Schurtz's scheme of social evolution does not accurately represent the facts. Certain widespread ideas connected with societies which Schurtz regards as identical the world over cannot be thus interpreted. Thus, initiation is not necessarily associated with puberty, degrees are not always symptomatic of age classes, the exclusion of women from organizations may be due not to the absence of their social instinct, as Schurtz contends, but to the sexual division of labor characteristic of each area. Societies then cannot be studied apart from their specific cultural surroundings.

ARCHAEOLOGY. As the result of twenty-two years' exploration under the direction of Professor Putnam, Mr. Ernest Volk has published *The Archaeology of the Delaware Valley*, which has an important bearing on the antiquity of man in the New World. The strata investigated may be divided into three layers—the black soil extending from the surface downwards, the yellow deposit or drift underlying this black soil, and the stratified gravel and sand older than the yellow drift. In the black soil of the Trenton terrace and lowlands numerous graves and pits were examined. The condition of the burials indicates considerable differences in the time of interment, while corresponding cultural differences appear in the stone implements, pottery, and style of decoration occurring in the pits associated with the graves. In the yellow soil, which was laid down during, or at the close of, the last glacial epoch, Mr. Volk found quartzite pebbles broken by fire or fracturing and argillite artifacts representing projectile points and tools with a jagged edge for cutting or scraping. In addition to these finds, there have been unearthed skeletal human remains deposited, prob-

ably by natural causes rather than by intentional burial, contemporaneously with the artifacts. In the Trenton gravel beneath the yellow drift Mr. Volk discovered chipped quartz, quartzite pebbles broken by fire and fracturing, bones of the musk-ox and the elk, as well as fragments of a human cranium and part of a human femur, which shows evidence of having been cut and worked by man. As these remains were found isolated and in stratified gravel, Mr. Volk concludes that they were a part of the gravel in which they were found, had been in or on some original gravel deposit, had been dislodged with it, and finally been redeposited with it. There is thus evidence for the existence of man at the time of the glacial deposits of the Delaware Valley.

Smith's paper on *The Prehistoric Ethnology of a Kentucky Site* is important as a contribution to the methodology of archaeological work and as an illustration of the way archaeology is correlated with ethnology. The author discusses the finds made in the Fox Farm, Mason county, Kentucky, from the standpoint of an ethnologist describing a primitive tribe of to-day, at least so far as the imperfection of the archaeological record permits. Thus the presence of charred specimens of corn and beans and of various animal remains, such as bones of deer and elk, yield evidence of the plant and game food used, while bone fish hooks and impressions of nets on pottery prove that the inhabitants of the site were fishermen as well as hunters and agriculturists. What implements were employed in agricultural work remains doubtful, as stone celts and oblongs possibly serving this purpose fail to reveal the polished edges caused by such use. Possibly all agricultural work was done by means of digging-sticks. In corresponding fashion, Smith discusses other aspects of culture, such as the preparation of food, men's and women's tools, dress, art, and modes of burial. The entire paper brings out with great clearness the advantages and disadvantages of archaeological, as compared with ethnological, investigation. The chief advantage lies in the definiteness of the objects of study, which affiliates archaeological research more closely with such natural sciences as paleontology. A serious disadvantage results from the fragmentary nature of the evidence. Thus, on the Fox farm there were not discovered any remains of habitations, and no pestles or mortars were found, though they occur in other sites of the region and can therefore not be supposed to have been unknown to the prehistoric natives of the locality studied. Smith's investigations indicate that the site represents Mills's "Fort Ancient Culture," and fell within the culture area of the Ohio valley.

In *A Study of Chiriquian Antiquities*, Professor MacCurdy makes a notable contribution to our knowledge of the archaeology of Panama. Except for the inferiority of its architecture, the stone art of this region is found to compare favorably with that of Mexico and Peru. Among the products of Chiriquian craftsmanship pottery, however, occupies the most conspicuous place. MacCurdy distinguishes painted and unpainted earthenware, and a considerable number of sub-groups, of which certain types characterized by decorative animal motives are the most interesting. Most common among these is the armadillo motive, which is associated with plastic art, while the alligator motive and its derivatives are executed in color. By conven-

tionalization these motives resulted in various decorative patterns, such as meanders or scrolls. Painted decoration was of three kinds from the standpoint of technique. In one form the figure was produced by the direct application of colors. The second "lost color" process consisted of tracing the design in wax, applying a solid coat of black over the decorated field, and plunging the vessel in hot water, which melted the wax and left the design in the color of the original ground. The third, relatively rare, method was to spade the figure out of the ground. Metallurgy flourished in ancient Chiriqui, and is exemplified by numerous gold plaques and figurines. Most of the images are simple or composite animal forms and are interpreted by MacCurdy as representations of deities. The culture area of which the antiquities are products includes not only the present province of Chiriqui but probably a portion of Costa Rica.

ASIA AND OCEANIA

VEDDAS. A standard work on *The Veddas* has been published by Dr. and Mrs. Seligmann, who are the first to describe in a systematic manner the social and religious life of these aborigines of Ceylon. The Veddas are divided into a number of exogamous clans with maternal descent; some of the clans are regarded as inferior to others, and their members are obliged to perform menial services for those of higher status. The social life of the wilder Veddas centres round the crude rock-shelters which serve as the dwelling-place of single families or groups of families. In the latter case, each family is rigidly confined within definite limits, but the men's bows and arrows are stored in a communal depository. Both sexes enjoy equal rights. The men hunt game, while the women dig yams. Marriage is monogamous, and conjugal fidelity is preserved in the highest possible degree. The marriage of first cousins, provided their parents stand in the relationship of brother and sister to each other, is the normal thing, but the union of children of two brothers or two sisters is regarded as incestuous. The widespread custom of avoidance between mother-in-law and son-in-law is rigorously observed by the Veddas; on the other hand the relationship of a man with his father-in-law is peculiarly cordial and intimate, generally surpassing in intimacy that between father and son. The sense of ownership is well developed, both with regard to the hunting grounds of territorial groups of Veddas and with respect to personal belongings. While the descent of clan names is matrilineal, property is inherited from the father, though the sons-in-law of the deceased also have some claim on the inherited articles.

While magical practices are not very conspicuous, the religion of the Veddas is marked by a fair degree of complexity. It centres in a cult of the dead, that is, of both the immediate ancestors of the people and certain legendary heroes, one of whom figures as the Lord of the Dead. To these supernatural beings the Veddas make ceremonial offerings of food, and on this occasion they are invoked to grant success in the chase or some other token of their loving-kindness. In each community there is an officiating shaman, whose function is to become possessed by the spirits, who speak through him, expressing their approval of the offering and promising assistance. This primitive stratum

of religion has been overlaid by Sinhalese accretions, foreign spirits having been adopted as friendly deities or remaining in their unassimilated alien form as hostile demons.

The general conclusion of the Seligmanns, both from the physical peculiarities and from the cultural characteristics of the Veddas, is that they represent the aboriginal inhabitants of Ceylon and form a part of the so-called Dravidian Jungle tribes of southern India.

BORNEO. Gomes has published important data on the religious customs of the Sea Dyaks. The principal deities of this people are Singalang Burong, the war god, who is represented by a carved and colored bird; Pulang Gana, who presides over rice-farming; and Salampandai, the maker of human beings. In honor of Singalang Burong the Dyaks celebrate feasts after the capture of enemies' heads, which are preserved as trophies, while a series of ceremonies connected with farming is dedicated to Pulang Gana. Besides the three principal deities, the natives also believe in a large number of minor spirits, whom they supplicate in lonely places for success in war or recovery from disease. Evil spirits cause sickness, and must be overcome by the aid of *manangs*, that is, medicine-men. According to Dyak pathology, the spirit snatches away the patient's soul, and it is the *manang's* business to pursue and retrieve it through the aid of his own familiar spirit. There are several grades of *manangs*; the highest of these bears a curious resemblance to the berdache institution of the North American Indians, in that these medicine-men, obeying a dream or supernatural order, assume feminine garments and thereafter conduct themselves as though they were women. The great reliance placed in omens—more particularly, in the cries and flight of certain birds—is a further characteristic of Dyak religion.

HAWAII. Under the native title *Ka Hana Kapa*, Brigham has given us the first thorough study of Hawaiian bark cloth. Significant differences from the tapa of other Polynesian tribes are noted. The mallets for pounding the bark in Hawaii are of two types—one with round section for preliminary treatment, the other with square section for completing the process. The mallets of the second type are carved with shark's tooth implements, the patterns leaving impressions on the beaten cloth, which become visible when viewed by transmitted light. While the Samoans and Fijians decorated their tapa with stencils made of carved plaques or of leaves with designs sewed on them, the natives of Hawaii almost always used stamps of bamboo stalks carved at one end. Only in very rare instances stamps were of wood or tortoise-shell. The dyes were prepared from charcoal, most frequently obtained by burning nuts. As compared with the decoration typical of other Polynesians, the Hawaiian tapa is lacking to a remarkable extent in realistic patterns; practically all the designs are purely geometrical, and symbolical interpretations are conspicuous by their absence.

AFRICA

BAKUBA. Under the title *Les Bushongo* Messrs. Torday and Joyce have given the first detailed account of the Congolese people more commonly designated as "Bakuba." The Bushongo nation is composed of a considerable num-

ber of tribes, of which the Bambala are the most prominent—all subject to a single sovereign residing in Mingenja, the capital, which is situated between the Kasai and Sankuru rivers. A politically independent section of the Bushongo inhabits the region to the east, about the town of Lusambo. From the very elaborate traditions of the natives, which comprise tales of migration, accounts of the origin of various crafts and customs, and records of over a hundred kings, the authors extract the historical conclusion that the Bushongo are immigrants from the north-north-west and have adopted a Bantu tongue in very recent times. A brief vocabulary of the ancient Bambala dialect shows some affinity with the languages of the Shari Basin (Lake Chad district). This conclusion seems to be confirmed by the recollection of the throwing-knife as a weapon.

The governmental institutions of the Bushongo reveal a remarkable development. The king is surrounded by six ministers representing the administrative provinces of the realm, as well as by many other dignitaries with military or judicial functions, representatives of the tradesmen's guilds, and the like. The king's power is to a certain extent limited not only by these councillors and the people at large, but also by his mother, who in some respects takes precedence over him. Inheritance of the throne is in the female line. The character of the Bushongo court is typically African, as is also the occurrence of the poison ordeal to test the guilt of a supposed murderer.

Though inheritance of property follows, like that of the throne, the female line, women themselves cannot inherit anything. Taboos against eating certain animals characterize each of a number of social groups into which the Bushongo are divided. The taboos are passed on from father to son. There is no religious idea connected with these regulations, for it is even permissible to kill the animal prohibited as food. On the other hand, men and women sharing the same taboo were apparently formerly debarred from intermarriage.

Among the social customs a two-fold initiation ceremony stands out prominently. At eight or ten, the king's son, together with boys of the same age, is incarcerated for nine days in an enclosure in the brush. During this period they are instructed in the tribal code of morality. The second initiation takes place at puberty. For a month the young men must live in the woods, divested of all clothing or personal decoration save a comb, and terrified every night by the buzzing of a bullroarer, which they take for that of ghosts. At the end of the month they are subjected to bravery tests by the masqueraded elders, and, after several payments, are permitted to adopt the cap indicative of maturity. In the Bangongo branch of the nation police powers are wielded by a powerful secret organization. The members were distinguished by a rattan eyeshade, and three officers wore wooden masks. Initiation of novices was heralded by the sounding of a friction-drum, to which human sacrifices were formerly offered.

There is a theoretical belief in a powerful creator, Chembe, but religious practice is largely confined to the fetich performances of the shamans. These fetich performers have specialized functions, some insuring good luck in war or the chase, others divining methods for treating patients or identifying of thieves.

SUDANESE NEGROES. A discovery of far more than purely philological interest has been recorded by Westermann in his monograph on Sudanese tongues. While the Sudanese Negroes have been commonly represented as revealing an almost indefinite linguistic differentiation, especially as compared with the Bantu stock which covers the larger part of southern Africa, Westermann shows that they too form but a single family of genetically related languages. The territory occupied by this family includes that geographically designated as the Budan, from Senegambia to western Abyssinia, but embraces in addition several enclaves in East Africa, such as that of the Kavirondo. In some portions of this immense area the language has been affected by that of neighboring Bantu and Hamitic tribes, but certain fundamental traits stand out clearly in all of them. Among these is the monosyllabic character of verbs, from which nouns are derived by prefixing a vowel. Where polysyllabic forms occur they can be explained either as due to composition from monosyllabic roots and affixes, or as terms borrowed from foreign tongues. Another highly characteristic and quite general trait of Sudanese is the analysis of every action into all its component parts, each of these being expressed by a separate verb coördinate with all the other verbs of the sentence.

Roscoe's book on *The Baganda* supplements former publications mainly as to the social organization of the tribe. The Baganda are divided into thirty-six clans, the members of each of which regard themselves as descendants of a common ancestor and hold sacred the same totem, of which every clan has two. With one exception the clans are exogamous. Each clan has special names for the children of its members, so that the personal name was an indication of an individual's clan affiliations. The clans are subdivided into branches and into still smaller groups, each presided over by a headman. While descent is ordinarily reckoned in the paternal line, princes belong to their mother's clan. Not all the clans enjoy the same social status. Some are regarded as quite inferior, or at least are never allowed to present a candidate for the throne. Most of the clans have specific functions, some acting as purveyors of the king or supplying the custodians for royal emblems and the priests of certain deities. The members of a clan always abstained from partaking of the flesh of their two totems, but they do not interfere with the destruction of the totems by members of other clans.

SOCIETIES AND EXPEDITIONS. The First Universal Races Congress was held in London, July 26-29, 1911 (president, Lord Weardale; secretary, G. Spiller). Its object was to promote a fuller understanding and better feeling among the races of the globe, and the anthropological and sociological questions involved were discussed at length. In September the British Association for the Advancement of Science met in Portsmouth, and Dr. Rivers, the president of the Anthropological section, delivered the momentous address noticed above. The American Anthropological Association (secretary, George Grant MacCurdy) and the American Folk-Lore Society (secretary, Charles Peabody) met in Washington during Christmas week. There were symposia on the influence of physical environment on culture and on the unity or diversity of the New World race and culture.

The Bureau of American Ethnology conducted linguistic researches among the Algonkin (Dr. Michelson) and the tribes of Oregon and Washington (Dr. Frachtenberg), while Dr. Radin and Dr. Swanton resumed their ethnological work among the Winnebago and Creek respectively. The Bureau has published a bulletin by Dr. Swanton on *Indian Tribes of the Lower Mississippi Valley* and two others by Dr. Fewkes on the *Navaho National Monument, Arizona* and the *Antiquities of the Mesa Verde National Park*, as well as the monograph on the Omaha mentioned above. The American Museum of Natural History supported fieldwork among the Menomini (Mr. Skinner), Teton Sioux (Dr. Wissler and Dr. Walker), Cree (Dr. Goddard), Crow, Hidatsa, and Mandan (Dr. Lowie and Mr. Wilson), Rio Grande Pueblos (Dr. Spinden) and Kiowa Apache (Dr. Goddard). In behalf of this institution Mr. Stéfansson continues work among the Eskimo of the Mackenzie River region, and Miss Kissell completed her textile studies among the Pima and Papago of the Southwest. The School of American Archaeology conducted excavations in Quirigua, Guatemala, and in the southwestern part of the United States. Dr. Speck of the University of Pennsylvania has continued work on the Penobscot, and Miss Sebbelov, of the same institution, visited the Osage. The University of California continues its linguistic and ethnological reconnaissance of that State (Dr. Kroeber, Mr. Waterman). Under the auspices of the new Canadian Department of Ethnology, Dr. Sapir visited some of the eastern Canadian reservations, Dr. Goldenweiser the Iroquois, and Mr. Barbeau the Wyandot.

ANTI-BOYCOTT ASSOCIATION, AMERICAN. See **BOYCOTT**.

ANTIGUA. A West Indian island which, together with Barbuda and Redonda, forms a presidency of the Leeward Islands (q. v.); the colonial seat of government. Area: Antigua, 108 sq. miles; Barbuda and Redonda, 62½. Population (1901): Antigua, 34,178; Barbuda, 755; Redonda, 120; total in 1911, 32,265, of whom 13,989 males and 18,276 females. Birth-rate (1909), 32.55, death-rate 27.38 per thousand. Illegitimate births, 72.90 per cent. Capital, St. John, with 7910 inhabitants (1911). Area under sugar-cane in 1908, 15,977 acres. Imports (1909-10), 177,594; exports, £199,284; revenue, £52,326; expenditure, £53,495. Rail-

ways (private), 16½ miles; telephone lines, 300 miles; post offices, 12. The governor of the Leeward Islands colony (1911, Sir Ernest Bickham Sweet-Escott) resides at St. John.

ANTI-SALOON LEAGUE. See **LIQUOR LEGISLATION**.

ANTITOXIN. Cumberlage advocated the administration of diphtheria antitoxin by the mouth, and claimed that this method had several points of superiority over injection. He says that results are obtained within a few hours after administration, a smaller dose is required—not more than 4000 units being given at a time, the usual dose being 2000 units, followed up, if necessary, by a further dose. By giving it in this way, it is possible to administer the antitoxin continuously by making a mixture and ordering it to be given every two or four hours as indicated. No patient treated by him in this way has shown signs of serum sickness (see **ANAPHYLAXIS**), and no rash or joint pains have ever been observed.

AQUEDUCTS. During the year 1911 severe droughts in America and Europe directed more than usual attention to the important water-supply projects in course of construction. In the United States these included the great Catskill and Los Angeles aqueducts. In Great Britain there was a number of extensions to the existing supply systems. In France the scheme of building an aqueduct from Lake Geneva to Paris was revived and discussed as a possibility.

CATSKILL AQUEDUCT. This project, on which substantial progress was made in 1911, had been under way since 1906. It will be recalled that it provides for the eventual taking of water from the Esopus, Rondout, Schoharie, and Catskill creeks, and delivering it to Greater New York, a distance of 127 miles, by an aqueduct passing under rivers and deep valleys, and by a system of pipe lines. The development of the Esopus watershed alone, which was in progress in 1911, was contemplated to make available 250,000,000 gallons daily.

During 1911 construction work was prosecuted actively on thirty-four main contracts for the Ashokan impounding, the Kensico storage, and the Hill View equalizing reservoirs; on the 110 miles of transportation works between the Ashokan reservoir and the terminal shafts in Brooklyn; and on nine miles of pipe line in Brooklyn and Queens boroughs. Seven of these contracts, amounting to \$22,000,000, were awarded during the year, making the aggregate amount of contracts awarded about \$91,000,000, upon which about \$18,000,000 were earned during the year, making a total of about \$42,000,000 earned to date.

on the excavations for the foundations of the new dam was in rapid progress. As the aqueduct by-passes the Kensico reservoir, it is not a necessary link for the delivery of water. The Hill View reservoir was rapidly taking shape and was about forty per cent. completed. It too is not a necessary link, as it is also by-passed by the aqueduct.

The plans provided that water first could be obtained for the city by discharging water into the present system at Croton Lake storage reservoir, which is crossed by the Catskill aqueduct. The construction on the Ashokan reservoir and the 65 miles of aqueduct to the Croton Lake was 78 per cent. completed as affecting the delivery of water, and, by temporarily pumping into the aqueduct at the

On the ninety-two miles of aqueduct of the Ashokan reservoir, the delivery of water could be effected early in 1913 to tide over any shortage which may exist in the present supply at that time. The successful completion of the tunnel under the Hudson River above West Point, at 1100 feet below sea-level, removed the last physical difficulty of moment on this stretch of aqueduct.

This was the most important from an engineering standpoint, of the seven pressure tun-

At the Ashokan reservoir, the masonry portion of the Olive Bridge dam was entirely completed, and the dikes and other works were so well advanced that the storage of water in the reservoir undoubtedly would be begun in the summer of 1913.

At the Kensico reservoir, the highway bridges were substantially completed, the two new temporary reservoirs to replace the old Lake Kensico were finished and were in use, and work

PRESSURE TUNNEL

GRADE TUNNEL

nels, all of which were under construction in 1911. It was built by sinking vertical shafts to a depth of 1100 feet in the solid rock on either bank and then connecting them by a tunnel 3030 feet in length. The work of driving the tunnel was commenced in January, 1911, and was all but completed on December 31 of that year, hardly a month's work being required for the meeting of the shafts. The tunnels under Rondout, Wallkill and Moodna creeks, and under Croton Lake, with an aggregate length of 75,000 feet, also were prosecuted vigorously during the year, and were nearing completion at its end.

On the 92 miles of aqueduct from the Ashokan reservoir to the city line, 73 per cent. of the construction necessary to transport water was completed, December 31, 1911. About 55 miles of full waterway section of 500 million gallons per day capacity was finished, of which about 35½ miles were cast in concrete during 1911. The accompanying table shows the progress for the different types of aqueduct.

Class	Length to be done Miles	Length completed Miles	Length partly done Miles
Cut-and-cover ..	54.8	38.2	47.7
Grade tunnel....	13.5	5.1	13.3
Pressure tunnel..	17.5	10.0	17.5
Steel pipe siphon	6.2	1.7	5.7
Totals	92.0	55.0	84.2

Contracts for the 18 miles of deep pressure tunnel from the city line at Yonkers to Brooklyn, through which the Catskill water will be delivered to the several boroughs, were let in June, 1911, and at the end of the year seven of the twenty-four shafts had reached tunnel grade and excavation from them was beginning. The aggregate depth of the twenty-four shafts was 7883 feet, of which 4157 feet had been excavated and 2595 feet lined with concrete. These tunnels should be completed by the end of 1915.

THE CITY AQUEDUCT AND PRESSURE TUNNEL. The plans, as officially summarized, provided that from the Hill View reservoir, Catskill water would be delivered to the five boroughs by a circular tunnel in solid rock reducing in diameter from 15 feet to 14, 13, 12, and 11 feet. From two terminal shafts in Brooklyn steel and iron pipe-lines will extend into Queens and Richmond. A cast-iron pipe, resting on

the harbor bottom, will cross the Narrows to the Silver Lake reservoir on Staten Island, holding 400,000,000 gallons. The total length of this delivery system is over 34 miles. The tunnel had been located at depths of 200 to 750 feet below the street surface, thus avoiding interference with streets, buildings, subways, sewers, and pipes. These depths are necessary, also, to secure a substantial rock covering to withstand the bursting pressure. The tunnel was being constructed from twenty-four shafts about 4000 feet apart, located in parks and other places where they would interfere very little with traffic. Through these shafts, also, the water will be delivered into existing pipes. Tunnel and shafts will be lined with concrete. The estimated cost was \$25,000,000, for tunnel, pipe-lines, and Silver Lake reservoir. The only parts of the City Tunnel work visible to the pedestrian were at the shafts. The tunnel passes from one to another, for its whole length under streets, parks, or rivers and at varying depths. In Brooklyn, beyond Shaft twenty-three, work will include pipe in trench to the shore in Bay Ridge; then pipe on the bottom of the Narrows to Tompkinsville, Staten Island; thence pipe in trench to the Silver Lake reservoir; through eastern Brooklyn and into Queens, pipe-line in trench from Shaft twenty-four, mainly along Willoughby Avenue, Troutman Street, and Flushing and Fisk avenues to Queens Boulevard.

The Catskill water will flow by gravity all the way and will rise under its own head to about 295 feet above sea-level in the Bronx, 280 feet in Manhattan, 260 feet in Brooklyn and Queens, and 230 feet in Richmond.

LOS ANGELES AQUEDUCT. This great work was reported nearing completion at the end of 1911, and the extraordinary rate of progress shown since the beginning of actual construction, October, 1908, was maintained through the year. The total length is 213.69 miles, and the construction includes tunnels, covered conduits, uncovered conduits, canals, siphons, and flumes, the estimated cost of which, including the water rights and rights of way was \$24,500,000. The time set for the completion of the work was in 1912, and with 81 per cent. of the time elapsed December 31, 1911, it was considered that the original estimate would be met. The work included 42.9 miles of tunnel, of which at the end of the year 42.5 miles had been excavated and 33 miles had been lined. There were 97.69 miles of covered conduit, of which 81.5 miles had been excavated, and 80 miles lined. Of the 37.2 miles of uncovered conduit 20.5 miles had been excavated, and 20 miles lined, while of 23.3 miles of canal 22 miles had been excavated. Siphons along the route include 12.43 miles, and of these 3.5 miles had been completed; and of 17 miles of flume .08 of a mile had been finished. The capacity of the new aqueduct was estimated at 430 second feet, which it was believed would afford sufficient water supply for the city with one million population, and supply irrigation for over 60,000 acres of land. An interesting feature of the project was the construction of the hydro-electric power plants, which were to develop 120 horsepower. The Los Angeles aqueduct was being built by the city of Los Angeles, and was one of the largest municipal works ever undertaken directly by an American city.

MANCHESTER AQUEDUCT. At the end of the year the two northern sections of this great English aqueduct from Thirlmere to Manchester, were very nearly completed, and of the third section 14 miles of pipe out of 22 miles had been laid. The work involves the laying of a third pipe-line, and is noteworthy in that fourteen railways must be crossed in the third section alone. Under the Manchester ship canal a tunnel was being driven 60 feet below the water level over two vertical shafts 600 feet apart. At the close of the year it was expected that the new pipe-line would be completed up to the outlying districts of the city by the following summer.

In connection with the additional water-supply works for the city of Glasgow, a tunnel over the Loch Arklet reservoir to Loch Katrine, a distance of about half a mile, was more than half finished at the close of the year. This project involves the construction of a large dam and important works for impounding the water. See **WATER SUPPLY**.

ARABI PASHA, properly **AHMED EL-ARABI**. An Egyptian revolutionist, died September 18, 1911. He was born of Fellah parents in Lower Egypt about 1841. His early life was spent as a laborer and he was soon conscripted for the army. He served for twelve years as a private soldier in the Egyptian army and gradually rose to the rank of colonel. As a result of injustice which he considered himself to have suffered, he became hostile to the rulers of his country and having been dismissed from the army, became attached to a secret society of Egyptian officers. His object was to displace the Turkish officers. Largely through his influence a movement for "Egypt for the Egyptians" came to great strength and in 1884 he took part in an insurrection which was successful. Arabi, as leader, demanded from the Khedive the dismissal of the ministry, the convocation of a parliament, and the increase of the army to 18,000 men. Most of his demands were acceded to and he entered the new cabinet as minister of war in 1882. In this position he became a virtual autocrat, setting aside the Anglo-French financial control. In June, 1882, a street row in Alexandria developed into a massacre of Christians. Although Arabi was acquitted of complicity in this, it had the effect of placing the supreme power in his hands, with the Khedive little more than a prisoner. Great Britain now interfered and the British fleet at Alexandria bombarded that city. The Egyptian troops, under the lead of Arabi, retreated, and the latter issued a proclamation of "irreconcilable war." In August, 1882, he was formally dismissed from the post of minister of war by the Khedive, and Sir Garnet Wolseley headed an army against him. Wolseley seized the Suez Canal and carried the earthworks at Tel-el-Kebir September 13, and two days later reached Cairo, where Arabi had taken a stand. The latter seems to have fled at the first attack of the British troops. He was pursued and finally reached Alexandria, where he surrendered to the British. He was tried for the crime of rebellion, was found guilty and sentenced to death, but this was commuted to imprisonment for life. He was sent to Ceylon with a pension of £30 a month, and in 1901 was allowed to return to Egypt, where he lived in obscurity until his death. Although he was personally insignificant, he was directly responsible for British in-

tervention in Egypt and for the British protectorate which followed.

ARABIA. See **TURKEY** and **EXPLORATION**.

ARBITRATION. The chief event in 1911 in the realm of international arbitration was the signing on August 3 of treaties of general arbitration between the United States and Great Britain and between the United States and France. These treaties, which were signed by the American Secretary of State, the Hon. Philander C. Knox, and by the British and French ambassadors respectively, provide that diplomacy failing to secure an adjustment of difficulties "relating to international matters in which the High Contracting Parties are concerned by virtue of a claim of right made by one against the other under treaty or otherwise, and which are justiciable in their nature by reason of being susceptible of decision by the application of principles of law or equity [they] shall be submitted to the Permanent Court of Arbitration established at The Hague by the convention of October 18, 1907, or to some other arbitral tribunal, as *shall* (may) be decided in each case by special agreement, which special agreement shall provide for the organization of such tribunal if necessary, to define the scope of the powers of the arbitrators, the question or questions at issue, and settle the terms of reference and the procedure thereunder." (Article I.)

This section refers to "all differences hereafter arising" and the treaties were drawn so as to exclude certain exceptions contained in the earlier treaties of arbitration between the parties, and "to provide means for the peaceful solution of all questions of difference which it shall be found impossible in future to settle by diplomacy."

As the United States Senate was in session at the time the treaties were signed, they were at once transmitted to it by the President and immediately referred to the committee on Foreign Affairs, which reported them back to the Senate with a recommendation that they be ratified, provided that paragraph 3 of Article III. be first stricken out.

Paragraph 3 of Article III., around which the fight has raged, reads:

"It is further agreed, however, that in cases in which the parties disagree as to whether or not a difference is subject to arbitration under Article I. of this treaty, that questions shall be submitted to the Joint High Commission of Inquiry; and if all or all but one of the members of the commission agree and report that such difference is within the scope of Article I., it shall be referred to arbitration in accordance with the provisions of this treaty."

A joint high commission is to be instituted in each case of difficulty arising by each of the parties to it designating "three of its nationals to act as members for the purposes of such reference; or the commission may be otherwise constituted in any particular case by the terms of reference, the membership of the commission and the terms of reference to be determined in each case by an exchange of notes. The commission shall have power to administer oaths to witnesses and to take evidence whenever deemed necessary, and the parties agree to adopt such legislation as may be appropriate and necessary to give the commission the powers above mentioned, and to provide for the issue of subpoenas and for compelling the attendance of

witnesses in the proceedings before the commission.

"On the inquiry both sides must be heard, and each party is entitled to appoint an agent, whose duty it shall be to represent his government before the commission and to present to the commission, either personally or through counsel retained for that purpose, such evidence and arguments as he may deem necessary and appropriate for the information of the commission. It shall meet whenever called upon to make an examination and report under the terms of the treaty, and the commission may fix such times and places for its meetings as may be necessary, subject at all times to special call or direction of the two governments."

Two reports on the treaties were made from the committee on Foreign Affairs—a majority report prepared by Senator Lodge; and a minority report prepared by Senator Root, presenting his views and those of Senators Cullom and Burton.

In support of its contention that Article III. should be amended, Senator Lodge's report declared that there can be "no question that through the machinery of the joint commission as provided in Articles II. and III. and with the last clause of Article III. included, the Senate is deprived of its constitutional power to pass upon all questions involved in any treaty submitted to it in accordance with the Constitution. The committee believes that it would be a violation of the Constitution of the United States to confer upon an outside commission powers which, under the Constitution, devolve upon the Senate. It seems to the committee that the Senate has no more right to delegate its share of the treaty-making power than Congress has to delegate the legislative power. The Constitution provides that before a treaty can be ratified and become the supreme law of the land it shall receive the consent of two-thirds of the Senators present. This necessarily means that each and every part of the treaty must receive the consent of two-thirds of the Senate. It cannot possibly mean that only a part of the provisions shall receive the consent of the Senate. To take away from the Senate the determination of the most important question in a proposed treaty of arbitration is necessarily in violation of the treaty provisions of the Constitution. The most vital question in every proposed arbitration is whether the difference is arbitrable. For instance, if another nation should do something to which we object under the Monroe doctrine and the validity of our objection should be challenged and an arbitration should be demanded by that other nation, the vital point would be whether our right to insist upon the Monroe doctrine was subject to arbitration, and if the third clause of Article III. remains in the treaty the Senate could be debarred from passing upon that question.

"One of the first of sovereign rights is the power to determine who shall come into the country and under what conditions. No nation, which is not either tributary or subject, would permit any other nation to compel it to receive the citizens or subjects of that other nation. If our right to exclude certain classes of immigrants were challenged, the question could be forced before a joint commission, and if that commission decided that the question was arbitrable the Senate would have no power to

reject the special agreement for the arbitration of that subject on the ground that it was not a question for arbitration within the contemplation of Article I. In the same way our territorial integrity, the rights of each State, and of the United States to their territory might be forced before a joint commission, and under Article III., in certain contingencies, we shall have no power to prevent our title to the land we inhabit from being tried before a court of arbitration. To-day no nation on earth would think of raising these questions with the United States, and the same is true of other questions, which will readily occur to everybody. But if we accept this treaty with the third clause of Article III. included we invite other nations to raise these very questions and to endeavor to force them before an arbitral tribunal. Such an invitation would be a breeder of war and not of peace, and would rouse a series of disputes, now happily and entirely at rest, into malign and dangerous activity. To issue such an invitation is not, in the opinion of the committee, the way to promote that universal peace which we all most earnestly desire.

"To take from the Senate, in any degree or by any means, the power of saying whether a given question is one for arbitration or not is to destroy the power of the Senate on the most important point to be decided in connection with differences arising with any other nation. Even if it were constitutional, to deprive the Senate to this extent of their share in the treaty-making power would be most unwise and perilous. The Senate of the United States is as earnestly and heartily in favor of peace and of the promotion of universal peace by arbitration as any body of men, official or unofficial, anywhere in the world, or as anyone concerned in the negotiation of arbitration treaties. The history of the United States for a period of more than seventy years exhibits a record of arbitration treaties unequaled by that of any other nation on earth. Every one of those treaties has received the cordial assent of the Senate of the United States. The Senate to-day is heartily in favor, in the opinion of the committee, of enlarging to the utmost practicable limit the scope of general arbitration treaties.

"The committee recommended to the Senate the approval of the enlarged scope for arbitration proposed in Article I., but it declined to admit that the destruction of the constitutional powers of the Senate is necessary to the promotion of peace and arbitration, or that their maintenance diminished by a hair's breadth the enlarged scope which these treaties propose for arbitration as the true method for the settlement of international controversies."

Senator Root's minority report denied that the treaties involved any abandonment of the constitutional powers of the Senate, holding that the contrary view "cannot be maintained except on the theory that all general treaties of arbitration involve such an abandonment, and no one thinks that it is so. The difference between a special treaty of arbitration and a general treaty of arbitration is that, in a special treaty, the President and Senate agree that a particular case shall be submitted to arbitration; while in a general treaty the President and Senate agree that all cases falling within certain described classes shall be sub-

mitted. That is what is done by the now existing general treaties of arbitration with England and with France; and that is what is done by the first article of the pending treaties, with a materially enlarged description of the class of cases to be submitted.

"The pending treaties also provide that, if the parties disagree as to whether any particular case comes within the description of the class which they have agreed to arbitrate, the question whether that case is one of the cases described shall be submitted to the arbitral decision of a joint commission.

"Provisions of this kind are very common in our statutes. For example, when Congress provides that a duty shall be imposed upon imports of one kind and not upon imports of another kind some officer has to decide whether goods which are imported come within the dutiable class or not. No one claims that the power to make such a decision involves a delegation to collectors of customs of legislative power to say what goods shall be dutiable.

"It is true that there are some questions of national policy and conduct which no nation can submit to the decision of anyone else, just as there are some questions of personal conduct which every man must decide for himself. The undoubted purpose of the first article of these treaties is to exclude such questions from arbitration as non-justiciable."

Senator Burton's views were set forth in a supplemental minority report in which he discussed at length the views set forth in the majority report, concluding with these paragraphs:

"The Senate, in the treaties of 1908, did not reserve the right generally to say whether or not a given question was arbitrable; it only reserved the right to say whether any specific question fell within the exceptions, and unless it should be extravagantly claimed that all differences would fall within the exceptions—in which case the existing treaties are a farce—the Senate has bound itself in advance under existing treaties to arbitrate without reservation a very large number of questions, and under these treaties it can not in good faith refuse to ratify a special agreement submitting to arbitration a difference which does not fall within exceptions expressly reserved.

"It appears therefore that the Senate in approving the existing arbitration treaties and the majority of the committee in approving the enlarged scope of arbitration proposed in Article I., and assenting to the arbitration of all questions within the rule therein prescribed, have shown a willingness to limit in advance the power of the Senate to object to the arbitration of a large number of questions, and it must necessarily be concluded that neither the Senate nor the majority of the committee consider that such limitations are a violation of the Constitution of the United States or that it is unwise or perilous."

Senator Root presented resolutions of ratification, to which Senator Bacon of Georgia proposed the following amendments:

Amend the second resolution by inserting after the word "question" in the fourth line the following words: "Which affects the admission of aliens into the United States, or the admission of aliens to the educational institutions of the several States, or the territorial integrity of the several States or of the United States

concerning the question of the alleged indebtedness or moneyed obligations of any State of the United States, or any question which depends upon or involves the maintenance of the traditional attitude of the United States concerning American questions commonly described as the Monroe doctrine."

So that the said second resolution when thus amended will read as follows:

"RESOLVED FURTHER, That the Senate advises and consents to the ratification of the said treaty with the understanding, to be made a part of such ratification, that the treaty does not authorize the submission to arbitration of any question which affects the admission of aliens into the United States, or the admission of aliens to the educational institutions of the several States, or the territorial integrity of the several States or of the United States, or concerning the question of the alleged indebtedness or moneyed obligation of any State of the United States, or any question which depends upon or involves the maintenance of the traditional attitude of the United States concerning American questions, commonly described as the Monroe doctrine, or other purely governmental policy."

Amend further the said resolutions by adding the following as an additional resolution:

"RESOLVED FURTHER, That the Senate advises and consents to the ratification of the treaty with the understanding, to be made a part of such ratification, that the treaty does not purport or intend that there shall in any case be denied to the Senate of the United States the full exercise of all the powers and duties conferred upon it by the Constitution of the United States in advising and consenting to the making of treaties and as to each and every part of the same and as to each and every question entering therein; and that nothing in said treaty shall be construed to impose any obligation, legal or moral, upon the Senate to waive its constitutional authority and duty to consider and determine each and every question entering into treaties proposed or submitted in pursuance thereof, including the question whether the matters in difference are arbitrable."

The treaties did not come before the Senate for final ratification during its special session, and an active campaign in their behalf was at once inaugurated by the President, who spoke with great force and earnestness in all parts of the country. In his address before the American Bar Association, August 3, he thus put the case for the treaties:

"We have negotiated two treaties, one with France and one with England, and we have constituted two tribunals. First a tribunal of arbitration pure and simple, to decide justiciable questions, and they are defined to be questions requiring for their solution principles of law and equity including both domestic and international law. To the second tribunal, a joint high commission, consisting of three representatives of the two parties, is committed not only the negotiation and recommendation in an advisory capacity as to controversies arising, but also a power of final decision by a vote of five to one as to whether questions in respect to which the parties differ as to their justiciable character are justiciable and come under the first section of the treaty. The majority of the committee on Foreign Relations in the

Senate has said that to enter into an agreement of this sort by the Senate is for the Senate to delegate some powers that were conferred upon it by the Constitution. Well, there were not any more powers conferred by the Constitution upon the Senate with reference to making treaties than there were upon the Executive. I think that is pretty plain, because the Executive has to initiate, and, of course, has to agree to the treaties before they can go into force.

"Now, my proposition is this: That if the Senate has power to make an agreement which shall bind it and the government—or rather, which shall bind the government and therefore bind it—to consent to the adjudication of any class of questions arising in the future by a board of arbitration, then it necessarily follows that it has the right to consent to this treaty. For the reason that the question arising before this commission is—what? It is the question of the construction of the first section of the treaty, and the class of questions most likely to arise in arbitration cases is that of the construction of treaties. Therefore, all the Senate agrees to do is to abide by the judgment of this joint high commission as to what the construction of that clause shall be in future when the cases arise. In other words, it is only agreeing to do what it has already agreed to do in a dozen of cases, namely, to abide by the arbitration of a tribunal as to certain classes of questions that arise in the future. They have done that. Therefore, they have admitted the power to bind themselves to abide by whose judgment as to certain classes of questions in the future, and this is only one of a class, to wit, one of a class of construction of the treaty.

"I am most anxious that that feature of the treaty should be allowed to remain in, and I am anxious because I want to make this treaty mean something, I want to have it have a binding effect—to accomplish something. You know they say the Indians when they are sick don't like any medicine except something that bites—something that is bad to take. Now, I do not think we are going to get ahead with this arbitration business unless we are willing to assume an obligation to execute a judgment that may bite and may be bad for us to take; and, if we are going to take the position that we will wait until the question arises and then conclude, because we do not think we can win in the arbitration case, that it is not a justiciable question, then we have written our promise in water and we have made agreements that will dissolve under the test of experience. And when that shall arise and the result follows which may be anticipated, then instead of promoting the cause of arbitration we shall have interfered with it, obstructed it and made it a laughing stock for nations."

In another address (before the Methodists at Ocean Grove) the President declared:

"We cannot make omelettes without breaking eggs; we cannot submit international questions to arbitration without the prospect of losing; and if arbitration is to be effective, and is to cover the ground that shall really promote the cause of peace and prevent war, it must cover the questions of the utmost interest to both countries. If the subject of arbitration is merely for discussion in peace societies and is only for the purpose of furnishing a text

for an address like that I am delivering to you, and if the result is not to mean real victory for one party and real defeat for the other, certainly the time of diplomatic officers, who have many other things to do, ought not to be wasted on it. I am very serious in my advocacy of arbitration as a means of settling international disputes, and I believe that you are. I am willing to abide by an adverse decision in a court of arbitration for my own country, even though it may impose a serious loss upon her, if the system of arbitration is to be made permanent and the court is of such a character that when I have a just cause I can count on receiving a just judgment. If we are going into the arbitration game, if I may call it such, we must play it through to the end, and we must take our hard knocks with equanimity, as we expect others to take theirs, with the hope and knowledge that the disadvantages that may accrue to each party can never equal the horrible losses of war."

One hundred and eighty boards of trade and chambers of commerce in cities with an aggregate population of 21,000,000 have endorsed the treaties and recommended their ratification. Every important city and State is represented in this list. The business bodies of Great Britain and France were also favoring the treaties. Large numbers of religious and civic bodies here and abroad declared in favor of ratification. The opposition came from those who sincerely believed that the Senate's prerogatives were threatened and from certain elements in the various communities who were antagonistic to the foreign countries, parties to the treaties. There was also a considerable number of people who felt that the treaties were inadequate to accomplish the ends in view. At the close of the year the Senate had not acted, and the newspaper dispatches reported that here was the possibility of a compromise between the conflicting views represented respectively by the President and the majority of the Foreign Affairs Committee. Former President Roosevelt was one of those who opposed the ratification of the treaties on the ground that questions affecting the vital interests and the honor of the country should be specifically withheld, as they were in the treaties which he himself negotiated while President, but which he withdrew from the Senate because that body refused to delegate to the Executive the power over future arbitrations under those treaties.

ARBITRATION WITH JAPAN AND GREAT BRITAIN. An unlimited arbitration treaty between the United States and Japan was understood to be well advanced. Friends of international peace in the latter country had already begun a campaign on the subject in the Japanese press. A concerted effort was being made to the same effect in this country. The Japanese Mission of the American Board (Congregational) thus expressed the opinion of those who favor such a treaty:

"We rejoice in the growing peace movement in Japan, and in the increasing evidences of a calm judicial spirit among its leaders, a spirit which refuses to exaggerate the slight offenses, to countenance a narrow nationalism, or to regard exceptional unfriendly utterances of individuals as indicating the spirit of the American people. We rejoice in the suggestion of an unlimited arbitration treaty between the United States and Japan, and hope that noth-

ing may be allowed to stand in the way of the framing and ratification of such a compact."

Dr. Inazo Nitobe, president of the First Higher College of Tokyo, has been spending the winter in this country to promote a better understanding between his country and America. David Starr Jordan, president of the Leland Stanford University, made a visit to Japan last summer for a similar purpose.

A treaty between the United States and Great Britain providing for the arbitration of pecuniary claims between the two countries, in accordance with the general arbitration treaty, was ratified July 19 by the Senate in executive session. The treaty provided that within four months either of the governments might submit to the other any claims which it desires to have passed upon. All claims not submitted within the time specified are to be barred. The tribunal provided for is to consist of one member chosen by each of the governments, and a third to be chosen by these two. The sessions of the tribunal will be held in Washington. A long list of shipping claims against the British government was submitted with the treaty. The list of claims against this government was much shorter, consisting of Canadian demands for the refund of hay duties. Many of the claims of the United States are of long standing, some of them having grown out of the Newfoundland fisheries dispute.

CASES REFERRED TO THE HAGUE. The following is a list of the recent American cases referred either to The Hague Tribunal or to special commissioners for settlement:

1. The North Atlantic Coast Fisheries case, between the United States and Great Britain, submitted to The Hague Tribunal by the special agreement of January 27, 1909, between these countries.

2. The Orinoco Steamship case, submitted to The Hague Tribunal under the protocol between the United States and Venezuela of February 13, 1909. This protocol also provided for the submission to The Hague of two other cases, namely, the case of the United States and Venezuela Company (Critchfield claims), and the case of the Orinoco Corporation. These were settled by the payment, on the part of Venezuela, of \$475,000 and \$385,000 respectively.

3. The Alsop claim, submitted to His Britannic Majesty as "Aimable Compositeur," under the protocol of December 1, 1909, between the United States and Chile.

4. The Chamizal case, resubmitted by the United States and Mexico to the International Boundary Commission under the convention of June 24, 1910.

5. The Emery case, in which the protocol between the United States and Nicaragua provided for the submission of the Emery Company's claim to a commission of three, one to be appointed by each country and these two to select a third. This claim was compromised for \$600,000.

6. The treaty between the United States and Great Britain relating to the boundary waters between the United States and Canada, signed May 13, 1910, provides for an international boundary commission of the United States and Canada and defines the jurisdiction of this commission. This commission has jurisdiction as of course in matters involving the use or obstruction or diversion of boundary waters; at the request of either party as regards any other

boundary matter; and by consent of both parties in regard to any matter between the United States and Canada. Several cases were about to be presented to this commission on behalf of one or the other party.

7. There has recently been negotiated a convention providing for a claims commission between the United States and Great Britain and the first schedule of claims to be submitted has been agreed upon between the two countries.

In March The Hague Tribunal handed down its decision in the Savarkar case. This was an interesting case between England and France, involving an important question of the rights of fugitives from justice in transit under the control of extradition officers. The decision was favorable to England's contention. See *INDIA, History*.

Two new cases have been submitted to The Hague Court, the tenth and eleventh respectively. The first is that of certain troubles arising between Russia and Turkey with regard to indemnity agreed upon at the close of the war between them thirty-three years ago; the second involves pecuniary claims between Italy and Peru. Dr. G. Leguia y Martfnez, foreign minister, and Fernández Alonso, the Bolivian minister to Peru, signed a protocol fixing the basis of action for the mixed commission which is to determine a definite demarcation of the frontiers in accordance with the recent treaty between Peru and Bolivia. The arrangement provides that any difference over questions of fact shall be submitted to the Royal Geographical Society of London.

A dispatch from Peking in March declared that the Chinese government had agreed to the appointment of Russian and Chinese commissioners with full powers to determine finally the frontier from Abagajtujewsk, in the province of Transbaikalia, to the Argun River, which, throughout its course, 440 miles, forms the boundary line between Russian territory and western Manchuria.

CARNEGIE PEACE ENDOWMENT. The Carnegie Peace Endowment of \$10,000,000 has been established. The scope of its purposes was outlined at the Mohonk conference by Dr. Nicholas Murray Butler: The trustees have determined to organize the undertaking as a great institution for research and public education and to carry on its work in three parts or divisions—a division of international law, a division of economics and history, and a division of intercourse and education. Otherwise stated, these three divisions will represent the juristic, the economic, and, broadly speaking, the educational aspects of the problem before the trustees, which is to hasten the abolition of international war by the erection of an international judicial system competent to hear and determine all questions of difference arising between nations.

The division of International Law will be under the direction of Professor James Brown Scott, whose services at the Department of State, at the second Hague conferences, and in connection with the American Society and Journal of International Law, are too well known to need specific enumeration. This division is to promote the development of international law, and by study, by conferences, by aiding negotiations, and by publication, to assist in bringing about such a progressive development of the rules of international law as

will enable them to meet with constantly growing adequacy the needs of the nations of the world in their juristic relations toward each other.

The division of Economics and History will be under the direction of Professor John Bates Clark, of Columbia University. The work of this division, like that of the division of International Law, will be scientific and scholarly in character, in organization and in method. Like the division of International Law, it will aim at the education of public opinion and at the formulation of conclusions that may serve for the guidance of governmental policy. With Professor Clark will be associated a score of the world's leading economists. England, Germany, France, Italy, Austria-Hungary, Switzerland, Holland, Denmark, Japan, the Argentine Republic, and other nations will have a voice and a part in formulating the problems to whose solution this division will address itself, and in working out the solution of those problems. The results arrived at in this case, as in the case of the division of International law, will not be those imposed upon the judgment of one people by the scholars and economists of another, but they will be those that are reached by co-operation between economists of a dozen nations. It will be the business of this division of the work of the endowment to study the economic causes and effects of war; the effect upon the public opinion of nations and upon international good will of retaliatory, discriminatory, and preferential tariffs; the economic aspects of the present huge expenditures for military purposes; and the relation between military expenditures and international well-being and the world-wide programme for social improvement and reform which is held in waiting through lack of means for its execution.

The division of Intercourse and Education (the director for which has not yet been announced) will supplement the work of the two divisions which may be called, perhaps, the scientific ones, by carrying forward vigorously and in co-operation with existing agencies the educational work of propaganda, of international hospitality, and of promoting international friendship. Among the tasks of this division will be to diffuse information and to educate opinion regarding the causes, nature, and effects of war and the means for its prevention and avoidance; to establish a better understanding of international rights and duties and a more perfect sense of international justice among the inhabitants of civilized nations; to cultivate friendly feelings between the inhabitants of different countries, and to increase the knowledge and understanding of each other of the several nations; to promote a general acceptance of peaceable methods in the settlement of international disputes, and to maintain, promote, and assist such establishments, organizations, associations, and agencies as shall be deemed necessary or useful in the accomplishment of the purposes for which the endowment exists. In other words, this division will make practical application of the teachings and findings of the divisions of International Law and of Economics and History.

WORLD PEACE FOUNDATION. At its annual meeting in November it was reported that during the year four important new books had been added to the International Library, published by the foundation, and already numbering

twenty volumes. The new volumes are Reinsch's *Public International Unions*, Bridgman's *First Book of World Law*, the *Proceedings of the Universal Races Congress* at London, and Senator Root's argument in the Newfoundland fisheries arbitration. The foundation has circulated during the year 300,000 pamphlets and leaflets of various kinds. Its directors and speakers have given large numbers of addresses in different parts of the country, and Dr. Jordan spent several weeks in Japan and Mr. Mead several weeks in England and Germany promoting closer coöperation between the peace leaders in those countries and the workers here.

Through coöperation with the American School Peace League and the Association of Cosmopolitan Clubs, the foundation is working to promote better international sentiment in schools and colleges, and it is now inaugurating important efforts among the students of European universities. The foundation coöperates closely with the Carnegie Foundation and the American Peace Society.

AMERICAN PEACE SOCIETY. This organization has been reorganized during the year. The chief features of the reorganization and federation plan are as follows: Twelve members of the board of directors to be chosen at large by the society at its annual meeting. In addition to these, each branch society having 500 members or fraction thereof over 100 to choose one member of the board, and an additional member for each additional 500 members or fraction thereof over 100. Each branch society to have the right to send one official delegate to the annual meeting of the society, and as many additional delegates as it has times 100 members. The board of directors, as thus reconstituted, to serve also as a national peace council. The society, as thus reorganized and receiving into its federation the various local peace societies of the country, to receive a subvention from the Carnegie Endowment, said subvention to be used in its direct work and through the branch societies. This plan of reorganization has been unanimously approved by the trustees of the Carnegie Endowment, who have accordingly voted a subvention to the society for the year 1912, on condition that the reorganization is effectively carried out. It has also been unanimously approved by the directors of both the New York and the Pennsylvania Peace societies, which have thus become constituents in the new federation. President, Senator Theodore E. Burton, of Ohio.

AMERICAN ASSOCIATION FOR INTERNATIONAL CONCILIATION. During 1911 this association issued the following leaflets: "School Books and International Prejudices," by Albert Bushnell Hart, January, 1911; Mr. Carnegie's Letter to the Trustees of the Carnegie Endowment for the Advancement of Peace, and Resolutions adopted by the Trustees, January, 1911; "Peace and the Professor," by Grant Showerman, February, 1911; "Woman and the Cause of Peace," by Baron d'Estournelles de Constant, March, 1911; "The Expansion of Military Expenditures," by Alvin S. Johnson, April, 1911; "The First Universal Races Congress," by the Rt. Hon. Lord Weardale, May, 1911; Opening Address at the Lake Mohonk Conference on International Arbitration, by Nicholas Murray Butler, June, 1911; "The United States and Latin America at The Hague," by William I. Hull, July, 1911; "The Emotional Price of Peace," by Professor

Edward L. Thorndike, August, 1911; Letter to the Apostolic Delegate to the United States of America, by His Holiness Pope Pius X, September, 1911; "The Existing Elements of a Constitution of the United States of the World," by H. La Fontaine, October, 1911; "The General Arbitration Treaties of 1911," November, 1911.

Of the latter pamphlet, 250,000 copies were distributed. It contained the full text of the treaties, the majority and minority reports from the committee on Foreign Relations, and sundry comments. The demand for this document indicated a healthful and growing interest in the subject of peace and arbitration.

The AMERICAN SOCIETY FOR THE JUDICIAL SETTLEMENT OF INTERNATIONAL DISPUTES held its annual meeting at Cincinnati, November 7 and 8. James Brown Scott is president. During 1911 it has issued the following leaflets: "The Importance of Judicial Settlement," by Elihu Root, February, 1911; "The Development of the American Doctrine of Jurisdiction of Courts over States," by Alpheus H. Snow, May, 1911; "An International Court of Justice the Next Step," by George Grafton Wilson; "Salient Thoughts," by Theodore Marburg, August, 1911; "The Work of The Hague Court," by N. Politis, November, 1911.

The Seventeenth LAKE MOHONK CONFERENCE held in May, at the invitation of A. K. Smiley, was as usual attended by a distinguished group of diplomats, American and foreign, publicists, officials and representatives of business bodies. President Nicholas Murray Butler, of Columbia, was chairman. There was an unusually large number of representatives from Great Britain and Canada.

The Third NATIONAL PEACE CONFERENCE was held at Baltimore, May 3 to 6. It was opened by the President of the United States. This was the first time a peace conference was ever opened by the head of a great nation. The conference was well attended. The speech of Cardinal Gibbons was highly appreciated as expressive of the awakening interest of the Roman Catholic Church in the new peace movement. Equally noteworthy was James Speyer's address on "International Finance: A Power for Peace." The following resolution, the fifteenth adopted by the conference, marks an advance step in sentiment along this line: "Resolved, That this Congress favors the suggestion that nations should prevent, as far as possible, loans being raised by their subjects or citizens in order to enable foreign nations to carry on war. And be it further

"Resolved, That the government of the United State be requested to include this question in the programme of the Third Hague Conference." Hamilton Holt was president of the conference.

The Third CENTRAL AMERICAN PEACE CONFERENCE met in Guatemala in January.

The Nineteenth INTERNATIONAL PEACE CONFERENCE was to have been held in Rome in November, but on account of the plague it has been postponed, as has, for the same reason, the meeting of the INTERPARLIAMENTARY UNION. This body, according to a statement of its council, received subventions during the past year from eighteen different governments, the total of which amounted to something over \$9000. The largest contributions were made by the United States, Great Britain, France, Germany, and Spain, in this order. The estimated expenses of the union for the coming year amount to

\$13,000. The meeting place of the conference and the union will be announced in 1912.

The First UNIVERSAL RACES CONFERENCE was held in London, July 26 to 29. It was an interesting and unusual gathering. Each race and nation was represented by delegates.

The fifth annual meeting of the AMERICAN SOCIETY OF INTERNATIONAL LAW was held in Washington, April 27 to 29. Senator Elihu Root presided and made a strong address on the present status of international arbitration.

OTHER ARBITRATION AND PEACE SOCIETIES. The following is a list of the State and local arbitration and peace societies:

- The International Peace Association.
- The Association of Cosmopolitan Clubs.
- The Massachusetts Peace Society.
- The Derry (New Hampshire) Peace Society.
- The Connecticut Peace Society.
- The New York Peace Society.
- The New York German-American Society.
- The New Italian Peace Society.
- The Buffalo Peace Society.
- The Pennsylvania Arbitration and Peace Society.
- The Maryland Peace Society.
- The Georgia Peace Society.
- The Arbitration, and Peace Society of Cleveland.
- The Kansas Peace Society.
- The Utah Peace Society.
- The Peacemakers of Washington.
- The Oregon Peace Society.
- The Redlands Society.
- The Peace Society of Northern California.
- The Peace Society of Southern California.

ARBITRATION AND CONCILIATION.

INDUSTRIAL LEGISLATION. According to the *Review of Labor Legislation in 1911* laws bearing on trade disputes were passed in nineteen different States. In addition Congress authorized the President to appoint any member of the Interstate Commerce Commission or of the Court of Commerce to exercise power and duties imposed upon the chairman of the Interstate Commerce Commission by the Erdman act. This act, passed in 1898, authorized this chairman to endeavor to bring together the employers and employees of any railroad threatened with a strike, and otherwise to endeavor to bring about a peaceful and immediate settlement of the dispute. Alabama created a State board of mediation and arbitration to bring about a settlement of strikes and lockouts which are threatened or which have occurred. Disputes may be voluntarily submitted in writing to this board; or the members of the board may personally investigate the local conditions giving rise to the dispute. The law also provides that the disputes may be submitted to a local board of three arbitrators. Members of both State and local boards are to receive compensation. Colorado passed a stringent law designed to make illegal a type of labor contract which has been used by mine operators and others since the labor disturbances of 1904. The new law makes it unlawful for an employer to demand as a condition of employment that a person shall not belong to any lawful organization. Colorado, Nevada, New York, and Wisconsin endeavored to prevent the breaking of strikes by employees secured under false representations. The Colorado law forbids any false statements or representations in regard to the kind of work or the conditions under which the work is to be done, and requires that any adver-

tisement or contract for employing labor must state that there is a labor dispute when such exists. Severe penalty for violation is imposed. Connecticut passed a thorough-going law against the black-listing of laborers. Georgia authorized the new commissioner of Commerce and Labor to investigate the causes of strikes and lockouts and to endeavor to bring about a settlement. Michigan repealed its law of 1889 creating a State court of mediation and arbitration. Indiana, Nebraska, Oregon, and Wisconsin required employers to issue letters to discharged employees stating the true cause of discharge; these laws were also designed to prevent black-listing. New Hampshire authorized a labor commissioner to endeavor to settle labor disputes personally; in case he fail he shall endeavor to have the parties concerned refer the matter to a board of arbitration, whose findings shall be binding for six months or until sixty days after either party gives notice of withdrawal. The law also requires that pending the decision of such a board business must be continued on the existing basis. If the commissioner fail to secure a board of arbitration he must request for public use a statement of the causes of the dispute. New Jersey made it a misdemeanor to give or offer anything of value to a labor representative to induce him to prevent or cause a strike; any such representative accepting any such offer was made equally guilty. The Wisconsin Industrial Commission must investigate any contracts, agreements, or rules of employment deemed unfair or unreasonable. Copies of all contracts or agreements must be furnished to the commission, which is required to publish annually not more than 250 pages of information regarding such matters.

BENEFITS TO RAILWAY EMPLOYEES. One of the most striking yet little noticed advantages of conciliatory methods of settling trade disputes was shown by the settlement of the demands of the locomotive engineers of the United States for an advance of 15 per cent. in wages. The railroad managers had agreed to an increase of 9½ per cent., but this was refused. Under the Erdman act United States Commissioner of Labor Niell intervened and secured increases of from 8.5 per cent. to 14.5 per cent. in different schedules. There resulted an increase of about \$4,000,000 to the annual wages of 780 locomotive engineers employed on sixty-one Western railroads, including 53 per cent. of the entire mileage of the United States. This was only one of many railway disputes settled late in 1910 and early in 1911, most of them by arbitration methods. The total annual increase in wages was estimated at nearly \$100,000,000.

CHAMBER OF COMMERCE PLAN. For nearly a century and a half the New York Chamber of Commerce has carried on arbitration in business disputes. Various plans have been tried with more or less success. In 1911 a new scheme was formulated. This provided that the disputants must sign an agreement binding themselves to abide by the award. They also agreed that, after the award, a judgment of the Supreme Court enforcing it may be entered. The plan thus introduces the element of legal compulsion, which is expected greatly to increase its efficiency. The disputants may either select from a list of efficient arbitrators, numbering about 200 members of the chamber, a single person as sole arbitrator; or they may each select

one arbitrator, who need not be a member, and these two shall select a third from a list drawn up by the Chamber of Commerce. The chief advantage of this method of settling disputes is that it avoids the legal delays of appeals to the courts; moreover, many arbitrations may be carried on at once; and the technicalities and intricacies of court procedure are avoided.

CANADA. The success of the Industrial Disputes Investigation act, passed in 1907, whereby investigation by some publicly constituted committee is made compulsory before either a strike or a lockout may be declared, led the National Association of Builders' Exchanges to request that this act be extended to include the building trades. They pointed out that the law had prevented a large proportion of projected strikes during the past four years.

GREAT BRITAIN. The breaking down of the conciliation agreement in the great railway strike (see **STRIKES AND LOCKOUTS**) was a severe blow to the movement for the substitution of trade agreements, with provision for the arbitration of trade disputes, for the more violent and wasteful method of trade war. This experience together with the temporary breakdown in 1910 of the compulsory arbitration scheme in New Zealand, and with experiences in Australia and Canada, led many to the conclusion that, although conciliatory methods may prevent open conflict and the cessation of industry in a considerable proportion of labor disputes, they will not prove successful with regard to many vital points. The experience seemed especially to show that it is impossible successfully to bind both parties to abide by the decisions of an arbitration board. Undoubtedly compulsory arbitration as carried on in Australia and New Zealand has brought about an adherence of both parties to the findings of the arbitrator in a greater proportion of cases than the voluntary method followed by the English plan of trade agreements. Since the cessation of many businesses, especially those of transportation and communication and other public service activities, has become intolerable under modern conditions of life, it would seem inevitable that some form of guaranteeing the continuance of these industries will be developed. The English and Canadian methods are voluntary with a considerable reliance on the power of public opinion to enforce a just decree. If, however, experience should show that these methods will not uniformly prevent the cessation of activities upon which public convenience and welfare very intimately depend, a more forceful method of settling trade differences will be introduced. See **TRADE UNIONS AND UNEMPLOYMENT**.

Following the railway strike the government established an Industrial Council, composed of representatives of both masters and men to deal with trade disputes. The consent of twenty-six prominent employers and workmen to serve on the council under the chairmanship of Sir George Askwith was secured. While this council was given no compulsory powers it was given extensive powers of mediation in the hope that a reasonable decision rendered by a body of such prominence would be accepted by both parties to a dispute.

The report of the Board of Trade on conciliation under the Trades Disputes act of 1896 and its amendment of 1898, providing for courts of arbitration, stated that the Board of Trade had taken action in sixty-seven cases in 1910; that

there were in Great Britain 282 conciliation boards, of which 265 dealt with particular trades and seventeen were district or general boards. There were reported ninety-six trade agreements, in which it was provided that failure of the respective boards of conciliation to reach an agreement should be followed by a request of the Board of Trade that it appoint an arbitrator. During 1910 eight cases were taken before the courts of arbitration authorized in 1908. These are arbitration boards made up of representatives of employer and employees, with a chairman chosen from a list prepared by the Board of Trade. The total number of cases dealt with since 1896 was 432, of which 201 involved a stoppage of work.

AUSTRALIA. The most advanced measures that have been attempted anywhere for the peaceful settlement of trade disputes have been tried in Australia. Provision is made there for special wage boards, for the organization of special arbitration boards for the settlement of trade disputes, and for the arbitration of all manner of questions by an arbitration court. Writing in the *Annals of the American Academy* for January, 1911, Mr. E. E. Olden of the University of Sydney pointed out that in Victoria 162 trades had registered under the Wage Boards act; that fifty-nine of these trades and 88 per cent. of the employees were under the wage boards. In South Australia similarly seventy-four were registered, and twenty-four of them, including 62 per cent. of the employees were under the wage boards. The act of 1908 providing for the formation of special boards for the settlement of trade disputes had resulted up to June, 1910, in the organization of 139 boards. These boards had decided ninety cases through the reenactment of awards of the Court of Arbitration, and forty-two cases by amending or varying the awards of other boards. The Court of Arbitration in New South Wales had made awards in 130 cases, and that in Western Australia in seventy-one cases. Each of these awards had affected many other disputes.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. A learned society founded in 1879 in Boston for the purpose of promoting archæological research by founding schools and maintaining fellowships, by conducting explorations and excavations and by aiding in those conducted by others, by publishing the results of archæological research, by holding meetings for the presentation and discussion of archæological subjects, and by maintaining courses of public lectures. The activities of the institute include various fields of archæological interest, especially Greek, Roman, Oriental, and Renaissance. It conducts researches in the United States, Mexico, and Central America. Its chief publication is the *American Journal of Archæology*, which contains original contributions, reports, and summaries of archæological work in all parts of the world, together with a bibliography of archæological books. The schools maintained by the institute are the American School of Classical Study at Athens, established in 1881; American School of Classical Studies in Rome, organized in 1895; American School of Oriental Study and Research, founded in 1900; and the School for American Archæology, founded in 1907. The Carnegie Institution of Washington supports a fellowship in archæology in the American School of Classical Studies at

Athens, and grants \$1500 annually for excavations.

The summer field session of the School of American Archæology was held at El Rito de los Frijoles, near Santa Fe, New Mexico. Excavations were begun here in 1908 and were in progress during the year at Tyuonyi in the Pueblos and Cliff Dwellings neighborhood. Excursions were made to facilitate the study of botanical and other conditions of the tribes dwelling in the vicinity. During August lectures were given on the distribution and culture of the tribes in the southwestern section of the United States; on the evolution of design as shown in ancient Pueblo art; and on the native languages and methods of recording them. A course was given by Dr. Lewis B. Paton, formerly director of the American School in Jerusalem, on the ancient Semites, to afford an opportunity of comparative study of cultures developed in semi-arid regions in the Eastern and Western continents. At the close of the session, opportunity was given to visit the Pueblos, Taos and Acoma, and the government excavations among the cliff dwellings in the Mesa Verde National Park, Colorado. The institute holds annual meetings. The meeting of 1911 was held at Pittsburgh, December 27-29, in conjunction with the meeting of the American Philological Association. Papers were read on the work of the institute, and the work of the various schools of the institute, especially in Athens and Rome. For a more detailed account of the work of the various schools, see article **ARCHÆOLOGY**. Professor Francis W. Kelsey of the University of Michigan was reelected president.

ARCHÆOLOGY. The past four years have been a period of consistent investigation if not one of spectacular finds. The work, however, has not been without illuminating discoveries, and among these several perhaps should be noted here. For the students of the "New Greek" comedy the year 1907-1908 was one of peculiar interest, for during that winter the excavations at Antinopolis in Egypt brought to light two sheets of manuscript containing each thirty lines from the *Perikeiromene* of Menander. The manuscript was early, dating from the third or fourth century A. D. In the following year there turned up, during the Italian excavations at Phaistos in Crete, a clay disk which has ever since held the attention of scholars. So far as can be made out from the pictographs, which cover both sides in the form of a spiral, the disk exhibits a hymn of some sort to some pre-Hellenic deity. While the year 1909 yielded nothing startling in the subject of archæology the next saw the inception of two excavations which promised to bear great results. The former of these was the excavation at Cyrene and the latter that inaugurated by Professor Butler of Princeton at the much-coveted site at Sardis. Of these two undertakings more will be said in the discussion of this year's work in archæological fields.

MESOPOTAMIA. The Germans have continued their excavations at Assur. During trial diggings in one part of the site remains of Parthian houses were encountered and among other objects brought to light were a gypseous stone plate bearing on one side an inscription five lines in length, and on the other a small relief representing a scene of worship, and a fragment of a statuette in alabaster representing Herakles. This is the second statuette of Herakles found

at Assur. On the site of the Assur temple a fragment of basalt bearing an inscription of Salmanassar came to light, and while widening the terrace of sun-dried brick in front of the temple the excavators came across remains of ancient paving, canals, and a basin. These investigations showed that the basin and paving, which for the most part owed its existence to Sargon, had to a certain extent been there in the time of Shalmaneser I. Older canals belonging to the time of Samsiadad or Irišums were also discovered. To the north of the Parthian palace Parthian houses were cleared out. These belong to the latest Parthian period and were arranged on a street having a northerly direction. Roman copper coins were discovered among the ruins and, inasmuch as one bore a head of probably the Emperor Alexander Severus who was in Mesopotamia in the year 231 A. D., it is probable that Roman influence had penetrated into the country at this time.

At *Babylon* the Germans have also been particularly active. While at work on the northwest trench, so-called, the excavators brought more clearly to light the top of the wall in that locality. This wall was followed to the north about sixty meters and to the south about 150 meters. The Ishtar gate was as well investigated. During excavations near the eastern wing wall several graves were found. One of these contained a clay coffin, which seems to have had a wooden cover; while with the burial was a rich find of gold and other beads; several glazed and unglazed clay vessels, hairpins, and various other objects of bronze came to light. Among the more notable of the smaller objects was a tablet or amulet of porcelain with a figured decoration on one side. After this, work was resumed upon the northwest trench and extensive wall remains were discovered. These were of baked brick and lay between the remains of the two mighty walls, which were respectively 7.30 meters and 11.25 meters in breadth.

At the same time that this work was progressing investigations were being carried on about the Arachtu wall, which was followed up to the fortification wall of the southern city. During this work it was found that the chief street of Babylon crossed the stream near the Nabonid gate. It is believed by the excavators that the processional street went over at this point by a bridge. It was also discovered that a wall of Nebuchadnezzar ran along parallel to the Arachtu wall for a considerable distance. In February and March excavations in the hill of *Amran ibi Ali* were carried on and special attention was devoted to the great Babylonian temple located there. It was found that the western front was 88.10 meters in length and the northern 78 meters. Both fronts were equipped with four towers—two lying to the right and two to the left of the middle of the front. In the middle is a strong door 2.20 meters broad, flanked by two triple doors.

Digging on the Street of the Processions brought to light entrances to two streets running east and west. On the procession street itself the houses bounding it were uncovered for a distance of about 180 meters. The houses were placed about seven to nine meters back from the street, while the intervening space was covered with a layer of sand. The small structures of sun-dried brick built up against them seem to have been stores. To the north where the house walls end in section *E II 22* a frag-

ment of a cylinder of Nabopolassar was found. It deals with the building of *Imgur Bel*.

In laying bare the street that runs north and south the front of a temple was uncovered in *A123*. It proved to be the smallest temple yet found at Babylon, measuring only 33 meters by 39 meters. On the faces of the walls of the building are towers—on the longer sides probably six and on the shorter five. These vary from 2.30 meters to 2.20 meters in breadth. The entrances to the temple are on the east and south sides, and both doors let one into a court 12 meters square. The west side of this court seems to have been the chief front. Behind it is the cella complex, which was threefold in plan so far as can be made out. In the foundation cist was discovered a small figure of unbaked clay with remains of clothing lying on the bottom of the chest in front of it.

PALESTINE. Important work has been done this year by Mackenzie in behalf of the Palestine Exploration Fund at 'Ain Shem—the Beth-Shemesh of the Old Testament. Trial pits sunk in the area between the Byzantine church and the *wely* demonstrated that this part did not contain pre-Roman remains and that the wall running north and south marked the borderline between late Arab debris on the east and the city area on the west. The older strata belong in the "Byzantine area," which is the eastern portion of the western city area. The outer wall of the old city was monolithic and strengthened with bastions; the southern gate has been found and repairs in various places suggest a severe siege at some time.

In the course of the digging much of the Semitic and earlier strata was encountered. Some of the pottery found next to the bedrock was of the Bronze Age and possibly belongs to the same people who are responsible for the megalithic monuments on either side of the Jordan. That these deposits occurring next to the bedrock are of an early period is proved by the presence among them of Cypriote Bronze Age pottery. One piece with a dead white decoration on a purplish black ground hints at Cretan influence, for this style was in use in Crete about 2000 B. C. This contact with the Mediterranean continued, for other fragments of pottery were found belonging to the time when late Mycenaean ware began to be imported into Cyprus. The pottery in question was Cypriote, and dates about 1200 B. C. Influences from Egypt as well as the Mediterranean were felt in this city, as is shown by the discovery of an alabaster vessel of the time of the eighteenth dynasty. A figurine representing the god Bes and an Astarte plaque were also recovered during the excavations. Among the more interesting of these smaller finds were a number of jar handles. Some were royal Israelitish and one of these bore the dedication "to the king, Hebron." Flint implements found along with the older Semitic pottery show that the beginnings of civilization at Beth-Shemesh were much earlier than we should be led to infer from the Bible.

The wall of the city is almost complete and incloses the top of the hill or stands upon the first escarpment. On the crest it is built of massive roughly cut stones in the lower courses and originally was topped out with smaller stones and, at one time, with sun-dried bricks. In places the wall rises to the height of fifteen feet. It was strengthened by bastions of vary-

SARDIS

EXCAVATIONS AT THE BEGINNING OF THE CAMPAIGN OF 1911

View from the West

ing width which projected only slightly from the face of the wall.

A thick layer of burned material was found over part of the town and the suggestion has been made that in this we have evidence that Beth-Shemesh was captured and burned either in the ninth or tenth century B. C. (since the remains above the burned stratum are correlated with Cypriote Aegean influences) or in the sixteenth or seventeenth century by the Egyptians. The city seems to have been inhabited without interruption from Neolithic times to the time of the Captivity. In Hellenistic times the site was abandoned and so left until the fifth century A. D., when the tradition connected with the Ark of the Covenant seems to have led to the establishment of a Byzantine monastery on the place.

EGYPT. At Abusir the Germans have discovered a cemetery, the burials of which belong for the most part to the early dynasties. A few objects belonging to the Middle and the New Kingdoms were recovered and a sarcophagus of Greek workmanship was also found. The excavations at Dimeh produced many papyri, among which were fragments of a poem, a philosophical treatise, and an account of the acts of martyrs. The cleaning out of the mortuary temple of King Chephren at Gizeh has been completed. From the fragments recovered it is estimated that the building must have contained over a hundred small statues. Before the temple was a terrace upon which stood five monuments, among which were a chapel, on either side of which were a pair of huge blocks upon which probably rested lions. The remains of another temple were also brought to light. The small pyramid at the middle of the south side of that of Chephren was examined, although no mortuary temple was discovered. It was thought to have belonged to the wife of Chephren. At Medinet Madi the German scholars found the remains of a pylon and a temple. On one wall of the latter appeared a Ptolemaic relief representing a king sacrificing to Isis, who is suckling Horus. At Memphis Flinders Petrie has been conducting excavations at the palace of King Apries. The entrance was found to be on the south side and approached across a broad fosse. Opening upon the entrance was a guardroom surrounded by a trench. To the west, beyond this, was the kitchen with the fireplaces still intact. The harem lay in the eastern part of the building and opposite the winter court of the palace. This court measured 116 by 117 feet and was protected by a roof supported upon columns nearly fifty feet in height. Beyond the winter court were discovered several halls and workrooms, while at the northern end of the palace was found the summer court with a veranda on its southern side, some fifty-five feet in height. The walls of the palace have the enormous thickness of fourteen to twenty feet, and the building covers about two acres of ground. During the excavations a large number of seals came to light of Egyptian, Persian, and Greek origin. The most interesting represented two men, one with the Hittite spread eagle behind him and the other evidently his king, taking an oath over a kid. In the temple of Ptah two sanctuaries—one of Amasis, 550 B. C., the other of Amenhotep III., 1400 B. C.—were discovered. In the former was found the best portrait of King Amasis yet known.

The work at Meroë has been carried on more extensively than ever with a force as large as

six hundred men employed at one time. As a result the temple of Amon, where the Ethiopian kings were crowned, has been entirely cleaned out. In the outer temple was found a royal dais with reliefs showing captives bound with their heels and elbows tied together behind their backs. In the same locality was also recovered a large black granite obelisk showing an inscription which the English scholars believe to be the best continuous Ethiopian inscription yet found. In the Hall of Columns the excavations produced another dais, this time cut from a single block of stone. Since glazed fragments were found near by it is thought that the dais supported a small statue. Among other finds was a fine cameo decorated with galloping horses so carved that one was white and the other black. Besides working upon the temple of Amon the excavators also completely cleared the temple of the Sun, which is situated about a mile out in the desert. In the funerary chamber on the south side were found vases filled with bones and charcoal, which perhaps belong to the human sacrifices mentioned by Heliodorus. On the walls of the building were reliefs representing men and boys being tortured and slain. Among other buildings cleaned out during the season's work was a large columned hall showing the king and queen in frescoes on the walls. In front of the entrance was recovered a massive head of bronze dating from the time of Augustus and representing possibly Germanicus. The eyes were inlaid in alabaster. Gold dust and nuggets valued at nearly \$10,000 were found in two jars; this was without doubt a part of the treasure assigned by tradition to the Ethiopians. The Nubian Archaeological Survey has lately exhibited a number of finds recently made in Nubia. These objects acquire a peculiar interest in view of the fact that the region will be submerged by the raising of the dam at Assuan. By far the most notable object was a mace about two feet in length and covered with gold foil in which were worked in relief figures of animals similar to those seen on the votive mace-heads and shields from Hierakonpolis. Judging from these finds it would seem that the predynastic and protodynastic culture of Egypt had penetrated into Nubia. At Tel el-Amarna the Germans have excavated about eighty houses, and so far as can be judged by the area now cleared the city seems to have been open in character. Though as yet but on the edge of the city the excavators came upon a street about sixty meters broad, running northwest and southeast. On either side of this street were discovered houses with courtyards, at times side by side and at times isolated. So far it has been impossible to arrange the city socially, but it can be seen that the houses of the great people did not cluster around the palace as at Illahun. Near the great houses were discovered small houses, which possibly belonged to the clients and dependents of the great people. The largest and best house yet found is that of Pa-wah, the high priest of the sun-disk in the temple of Ra. This house, which measured 75 meters by 125 meters, is located on the edge of the city and stands with its narrow front on the street. The house is enclosed by a smooth wall which is penetrated by a pylon-like structure which lets one into the gardens, where is the great pond which seems never to be lacking in the great houses. Behind the pond was discovered a small kiosk with an entrance hall and

a ramp. The interior of this building is decorated with frescoes representing the royal family in prayer before the sun-disk. That the garden was planted with trees is made fairly certain by the discovery of tree roots in the garden of another house. The house of the high priest had two façades—one fronting on the street, the other on the garden. In front of one of the street entrances was found a paved space and small benches used by the servants of the house while waiting for visitors. Behind the door was the porter's lodge, around which one passed to enter the courtyard that contained the magazines, stalls, etc. In one stall a pierced stone was found upon the ground (for securing animals), while in others were discovered cribs. Some rooms indeed contained remains of leather harness. In a separate part of the court was a row of silos. The main house was solidly built with a complicated arrangement of two broad halls and two reception-rooms, to be used the one in summer, the other in winter. The frame of the entrance door of the house was inscribed with a hymn and the name and titles of the owner. From one of the halls one could mount to the roof of the building. A peculiar feature found in many of the houses was a small, stumpy pyramid with a round depression in the top to receive the feet of bedsteads and so prevent them from sinking into the floor. In the pond in the courtyard of one house was discovered the endpiece of a falence bead necklace bearing the name of Amenhotep III. Evidences of later settlements were also found at Tel el-Amarna.

ASIA MINOR. The work of the Germans at Didyma in 1911 has determined the street leading to the temple. The last milestone was located about 250 meters from the temple and the inscription upon it narrates in both Greek and Latin that Trajan completed the street in the year 101-02. Through a gate one entered upon a finely paved street which led to the asylum that surrounded the temple. Trial diggings at this place brought to light the remains of mortarlaid walls of many houses. These were located about 100 meters away from the temple. Before the middle of the temple was discovered a circular base with two doors which marks the site of the old altar of ashes belonging to the earlier temple and mentioned by Pausanias, V. 13, 11. More than the eastern half of the temple is now cleared and the building is found to be remarkably preserved. At Miletus Wiegand's excavations are drawing to a close so that now one can make out the usual monuments of the city, as well as its general arrangement. The excavations have produced evidences of habitation reaching from the Neolithic period to the beginning of Turkish rule in the sixteenth century A. D. From a prehistoric settlement on Kilitepe came some axes and coarse pottery. The settlement lasted over into the late Mycenaean period, as is shown by geometric fragments. In the Hellenistic city the wall has been investigated for a distance of 220 meters in the southeastern part, and two great gates have been found. The general character of the city has been determined and the *insulae* have been found to measure about 29 meters by 55.5 meters, and the streets to vary in width from 4.4 meters to 4.5 meters. The excavations at the temple of Serapis have been brought to a close. The structure is third century in style. The Baths of Faustina have been found to be connected with

the stadion by a great colonnaded hall. In the Baths the apodyterium has been located.

This year has seen the resumption or rather continuation of the excavations of the Americans under Professor Butler at Sardis. Since the early part of the season was very cold and the work would have been hampered by the heavy falls of snow, the efforts of the expedition were concentrated at first on the digging out of the tombs in the mountainside across the river Pactolus. This work was in the hands of Mr. Buckler, who opened over two hundred tombs, which averaged six burials to a tomb. From these excavations a large number of objects of gold, silver, and bronze were recovered, together with a great deal of pottery. That these burials go back to a remote past is shown by the finding of pottery resembling that of the Mycenaean age in Greece, and the duration of the burials is evidenced by the presence of sherds resembling the black-figured, red-figured, and later pottery of the fifth and fourth centuries. In fact, in some of the tombs were large urns, containing charred bones, which bear inscriptions in ink and which cannot be referred to a period earlier than the first century B. C. Fortunately only a few of the tombs have been rifled in modern times, and although they have been cleared out in antiquity for subsequent burials, the objects which had been in the burial chamber had been deposited outside the tomb, so that its history could be followed. Only one tomb was found that had not been so treated and its undisturbed condition was due to the fact that a floor of a tomb over it had caved in and so protected it. In this tomb was discovered ware resembling Rhodian and Mycenaean ware. Most of the un-rifled tombs contained only unglazed ware, with occasional specimens of small, black-glazed pottery with decorations in yellow and white paint. Some unglazed ware with designs in black and brown was also found. In later times, when incineration was the custom, the urns containing the charred bones were placed on the couches already strewn with the bones of earlier burials.

Gold and gems turned up in places where they were least looked for, and rarely in connection with good pottery. The resemblance that the jewelry bears to Etruscan work suggests that there may be some historical connection to be seen here. The seals found in the tombs are very beautiful and, though some belong to Hellenistic times, the majority date from the Græco-Persian period. Most of them are of chalcedony and are mounted in gold or silver.

Near the edge of the bluff that rises abruptly from the river remains of crude walls were encountered which seem to belong to houses. The foundations were of stone, the walls of sun-dried bricks, and the roofs were covered with tiles, which in some cases were decorated with a burned-in design. The simas were modeled in relief with geometrical patterns or lotus designs or animal figures, such as lions and horses.

As soon as the weather permitted, on February 16, work was resumed upon the clearing out of the temple, which was begun in 1910. The fact that the temple lies on the side of a hill made the excavation more and more difficult, as the work progressed, for each meter cut back meant a distinct deepening of the soil until a depth of about ten meters was reached. By the end of the season the cella of the temple had been cleaned and the twenty columns on the south side freed. On the northern side eighteen col-

TOMBS ON THE HILL ACROSS THE PACTOLUS

**EXCAVATED COLUMNS OF THE TEMPLE
SARDIS**

urns were dug out, while on the eastern end two columns were cleared and four brought to light. All that is now left to do in order to lay bare the whole temple is to excavate the six northern columns of the eastern portico. As the work went on it was found that the entire cella had been used at some time—probably when the walls were partly buried—as a cistern. For this purpose the interior had been dug out and the bottom lined with concrete. In the opisthodomos it was almost two meters in thickness. The architectural details of the temple show that the temple was erected at the beginning of the fourth century. Evidence turned up in 1911 which seems to indicate that the building was in use in the second century A. D.

Most of the coins found belong to Hellenistic, late Roman, and Byzantine times. Fifty-four beautifully preserved silver tetradrachms were found in the vertical joints of the floor near the statue's base, where they probably lodged when they were thrown at the feet of the statue. They belong to the successors of Alexander and Alexander himself. A silver coin of Croesus was found below the base of the statue.

Not the least interesting of the finds made was the discovery of a stele with a long Lydian inscription upon it.

GREECE. The Greek Archæological Society have conducted some interesting excavations in Athens, where to the northwest of the Acropolis, on the site of the Bouleuterion, several important finds have been made. One of these is a fifth-century marble head of a youth, resembling the type of the Apollo of the Omphalos. Behind the supporting wall behind the Pnyx Kourouniotis found fragments of pottery which show that this wall goes back no further than the end of the fourth century B. C. Some twenty-four feet inside this wall another retaining wall was encountered, which is considerably older. In the Agora were found a portico almost perfectly preserved and the torso of a boy similar to the Eleusis boy. The work of Brueckner in the neighborhood of the Dipylon cemetery has thrown much light on topography and laid bare an interesting system of irrigation. Particularly noteworthy among the finds is a series of forty-four ostraka, eleven bearing the name of Thucydides the son of Melesias, the opponent of Pericles, who was banished in 442 B. C., twenty-six that of Cleidippus the son of Deinias, who led the fleet to Lesbos in 428 B. C., one of Teisandros, the son of Epylikos, who was the father-in-law of Pericles's eldest son.

At Delos the French have completed their excavations at the sanctuaries of the foreign gods and the portico of Philip. The latter building was found to have been largely increased in size in the second century B. C. It was then used as a place for exhibiting wares.

In northern Greece, at Pagasæ, a second tower, filled with rubbish containing many painted stela of the character previously found in this place, has been excavated. About a hundred in all were found and some of these were very beautiful. At Laspochorion, also in Thessaly, a number of geometric tombs were found. At Gonnus a round temple of Athena and fragments of a statue of the goddess bearing the name Xenocles—perhaps the sculptor—were discovered.

In the Peloponnesus one has to record activities in several localities. At Tiryns the Germans have recovered Mycenaean wall-paintings of

great interest. Though found in small pieces the pictures have been put together enough to allow one to see that the decoration was a frieze of figures considerably under life size, representing a boar hunt. Boars are shown being pulled down by dogs or being caught in nets. The scene takes place amid tall reed, while women in chariots watch the hunt from the background. The work is decadent and shows the influence of the great period of Cretan art, the late Minoan I. The French have finished their work at the temple of Athena at Tegea. On the island of Cephalonia Cavvadias believes that he has found evidence for three successive strata of culture. The first is neolithic (dating about 3000 B. C.), and is characterized by rude monochrome pottery. The people of this period lived in wooden huts before which or in the floors of which they buried their dead. The second culture, following about a thousand years later, is pre-Mycenaean. The last culture represented is Mycenaean. Cavvadias believes, from the discovery of some hundred Mycenaean tombs, that this island is to be considered the home of Odysseus. The hero seems to be acquiring as many domiciles as Homer! At Goritsa in Corfu very interesting finds have been made. Here a temple has been discovered, the sculpture of one of whose pediments is almost completely preserved. There were originally eleven sculptured, vertical slabs, of which eight remain. In the centre of the composition is a huge Gorgoneion with Chrysaor on one side and Pegasus on the other in much smaller size. Then on either side come a pair of huge panthers separating the central group from the other figures. The last block on the left shows a fallen warrior with his head in the corner of the pediment. The block next to the panther on the right of the pediment exhibits the nude figures of Zeus and a giant. The style of the work is related to the Argive-Corinthian.

The English excavations in Melos have shown interesting points of contact between the island and the mainland, as well as Crete. An interesting find was a series of eight or nine intramural infant burials. The bodies were placed on jars belonging to the geometric period. In Crete, at Gournia, the expedition of the Philadelphia Museum reports the discovery of about 150 cramped burials in inverted jars. At Haghia Triada, in the same island, the Italians have found perhaps the oldest market-place in Greece. At Tylissos the Greeks have discovered remains of a palace and culture thought to be even richer than the culture found at Cnossos. In Cyprus Richter has made finds of great archaeological and ethnographical importance.

AFRICA. At Cyrene the American expedition has resumed the work of last year. A group of Ptolemaic buildings has been uncovered, while on the slope of the hill about 3000 terra cottas, of the fifth century and earlier, have been found. Some fine sculptures also have been recovered. The work of the year has been clouded by the murder of DeCou by a party of Arabs.

ITALY. At Ostia a number of Republican tombs have been opened. In the theatre was found a fountain statue of Aphrodite resembling the Venus of Arles. In the Baths of Diocletian two new swimming baths have been discovered.

NORTHERN EUROPE. The discovery of a Mithras sanctuary is reported near Strassburg.

ARCHÆOLOGY, AMERICAN. See ANTHROPOLOGY.

ARCHITECTURE. INTRODUCTORY. The three years previous to 1911 have been marked, in general, in both Europe and the United States, by a normal architectural activity, evidenced in important buildings begun or completed, and in the active prosecution of work on others still unfinished. In the first category are the various international exhibitions held at Brussels, London (the Franco-British followed by the Japanese), and Buenos Ayres, and the Yukon-Pacific Exhibition at Seattle, Wash., the great Victoria and Albert Museum at London, the Palace of Justice at Rome, and the brickwork of the Campanile of St. Mark's at Venice. In the United States the monumental Pennsylvania railway station at Washington and the still greater terminal of the same railway in New York were completed; in New York the new municipal offices were begun, and the 700-foot Metropolitan Tower opened for occupation. The Hague Peace Palace, the London County Council Building, the colossal Victor Emmanuel II. monument in Rome, the Campanile of the Church of the Sacred Heart (Sacré Cœur) in Paris, the Cathedral of St. John the Divine at New York, and the New York Central Terminal Buildings, were advanced towards completion and a vast number of university and library buildings of greater or less importance were undertaken, carried forward, or completed, especially in the United States, England, and Germany. Particularly worthy of notice has been the new architectural activity in Argentina and in South Africa.

In the United States the volume and variety of new architectural work, which rose rapidly after the financial depression and panic of 1907, have far surpassed those in any other country, and have included many edifices of first-rate importance. In this activity the recrudescence and almost complete reconstruction of the city of San Francisco, devastated by the earthquake and fire of 1906, stand conspicuous.

These years have also been notable for the continued progress in and expansion of the uses of concrete, especially of reinforced concrete ("ferro-concrete," "ciment armé") in architecture as well as in engineering, and in the United States, for the continuance of the practice of erecting office buildings of excessive height. Another feature of the period under discussion has been the widespread and increasing interest in the problems, the science, and the art of town planning and of all forms of municipal improvement, particularly in the planning of garden-villages and semi-rural suburbs. The most notable manifestation of this interest was in the town-planning congress at London in 1910, reported in the YEAR BOOK of last year.

ARCHITECTURE IN 1911. The past year has witnessed the continuance of the general tendencies of the preceding year, with no great change, in either Europe or America, in the amount or character of the architectural activity. The use of reinforced concrete steadily increased, and it is clear that it has perceptibly invaded the field of steel construction, as well as that of masonry in brick and in stone. The result has been an organized effort in certain quarters to discredit it on account of the disastrous collapse of buildings erected in too great haste with this material, but its extraordinary advantages when rightly used have become so evident that it is clearly destined to become the distinctive building material of the

twentieth century, as iron and steel were of the nineteenth.

During 1911 there was manifested also an unusual interest in fire prevention. The increasing congestion of population in large cities, the growing complexity of life, the multiplication of machinery and especially of electric appliances and internal-combustion motors, have greatly increased the fire risk, and disastrous fires in buildings constructed in a manner formerly considered fireproof have stimulated research and invention in the effort to combat these increased risks. Many cities, in both Europe and America, have amended or have taken steps towards amending their building codes; and the tendency is everywhere towards new and superior standards of construction, especially in the United States, where fire losses have always been so great and so frequent.

The year was also marked, like its predecessor, by great and widespread interest in the problems of city planning and suburban development, although there was no great international congress on the subject to compare with that in London in 1910. England and Germany again led in activity in this direction, though the British Town-planning act has not produced as yet the important results expected of it. (See MUNICIPAL GOVERNMENT.) International congresses and exhibitions of various kinds were held in a number of places; a Hygienic Congress and Exhibition at Dresden; two exhibitions in Italy to celebrate the jubilee of Italian independence—one of science and industry at Turin, the other of fine arts at Rome—and at Rome the Eighth International (triennial) Congress of Architects; besides national, provincial, and municipal exhibitions and conferences on subjects related to architecture in many cities on both sides of the ocean.

EUROPEAN ARCHITECTURE: GREAT BRITAIN. The improvement of London was materially advanced by the final completion of the Queen Victoria Memorial in front of Buckingham Palace in the axis of the Mall, the masterpiece of Sir Thomas Brock; by continued work on the Kingsway and Aldwych, by the purchase of a fine plot for new government buildings between Whitehall and the Victoria Embankment, by the construction of a new approach to the Cathedral of St. Saviour, Southwark, from the end of London Bridge, and by the opening of a new thoroughfare leading to the new wing of the British Museum, to be called British Museum Avenue. There was continued activity in many lines of building, the most important single undertaking being the London County Hall, for whose basement story—the costly foundations having been at last completed—the contracts were let for the sum of £104,000, and work actively prosecuted. The architect, Ralph Knott, prepared a new design for the façade towards the river, recessing the central portion with a quadrant at each end, to the great enrichment of an otherwise rather tame composition. The new Post Office, by Sir Henry Tanner, was completed on King Edward Street, the American system of steel-frame construction being employed, with concrete floors and fireproofing. The extension of the British Museum, by J. J. Burnet, was externally completed, presenting an imposing front of twenty-one Ionic columns between two massive terminal pavilions adorned with sculptures by Sir George Frampton. Progress was made on the additions to the National Gallery, and on the

great Wesleyan Memorial Hall (Lanchester and Rickards) in Westminster, the concrete dome over the central portion being completed; on the new King's College Hospital on Denmark Hill, by W. A. Pite, which, when completed, will comprise nine three-storied blocks of wards besides the administration wing; and on other less important works. A new Y. M. C. A. building was nearly completed on Tottenham Court Road, from designs by C. R. Rowland Plumbe, F. R. I. B. A.; it is the largest and most complete structure of its kind in the kingdom, constructed largely of concrete and steel, and comprising a college, clubrooms, and lodgings for 1000 men, besides the usual association meeting and reception-rooms. The cost was \$1,000,000. The palatial Royal Automobile Club on Pall Mall, by Mewes and Davis, was opened, and a new opera house, said to be unusually commodious and elegant, was completed for Oscar Hammerstein, the New York impresario. On the new Kingsway the Church of the Holy Trinity was completed from designs by Mr. John Belcher. A competition for a new municipal building for Marylebone resulted in the award of the work to Mr. Edwin Cooper, F. R. I. B. A. Among many other enterprises may be mentioned a new building for the Zoological Garden in Regent's Park, the new Electrical Engineers' Club, the Polytechnic Hall on Regent's Street, the London and County Bank (Godfrey Pinkerton, F. R. I. B. A.), and a new reredos for St. Paul's Cathedral. The project of the proposed St. Paul's Bridge excited vigorous controversy with respect to its exact location and alignment, and the question has apparently not yet been settled. An important educational measure was the decision to consolidate the schools of architecture of London University and King's College, under the general direction of Prof. F. M. Simpson.

In other cities of the kingdom there has been considerable activity in building. The great choir of Liverpool Cathedral has been materially advanced, the walls having been completed and the vaulting begun. In the same city the palatial building of the Royal Liver Friendly Society, costing \$3,500,000, was opened in July. At Manchester an important competition was held for the proposed new art gallery and library, for which 220 competitors were entered. The prize was awarded to Messrs. Crouch, Butler, and Savage, for a dignified, though not strikingly original, design in classic style. In the same city a new botanical library was erected for the university, and the Y. M. C. A. building completed (Rowland Plumbe). Another important competition, that for the Coventry Municipal Buildings, was awarded to Messrs. Garratt, Simister, Buckland, and Farmer of Birmingham. There was considerable building done for the various universities and colleges; at Cambridge, Mr. T. G. Jackson's Museum of Archaeology and Ethnology was partly completed and the recently discovered fragments of Inigo Jones's choir screen for Winchester Cathedral were restored and set up in it. A building for lectures was completed by Hubbard and Moore. Buildings by Messrs. Tait and Harvey were erected for the Royal Albert Memorial University College at Exeter; at Newport a new Technical Institute by Charles F. Ward; at Hull, elaborate buildings for the Hull Training College by Crouch, Butler, and Savage; at Sandhurst extensive new buildings for the Military College, by H. B. Meas-

ures, F. R. I. B. A., were begun, to have a frontage of one thousand feet and to cost \$1,250,000. At Oxford the High Street front of the University College was restored; a new building by Basil Champneys for Oriel College opened; the new quadrangle of Brasenose College, by Hayward and Wooster, was completed, and the Union Society's building, by Mills and Thorpe, occupied. At Winchester the extensive repairs to the cathedral, carried on during the past three years under the direction of Mr. T. G. Jackson, R. A., were completed, at a cost of \$500,000. At Bristol, the new surgical wing to the Royal Infirmary was completed by H. Percy Adams and Charles Helder. Important competitions were held for the Welsh National Library at Aberystwyth, won by S. K. Greenslade, and for the Welsh National Museum at Cardiff, won by A. Dunbar Smith and C. C. Brewer; and in the latter city the Glamorgan County Hall was completed, by Harris and Moodie. At Dublin, the new Royal College of Science was opened in July, destined to form part of a group or block of buildings with certain government offices; the architect was Sir Thomas Deane, R. H. A., associated with Sir Aston Webb of London. Glasgow reports the opening of the fine new Mitchell Library on October 16 (W. B. White, F. R. I. B. A.) and the erection of the buildings by Walker and Ramsay for the National Scottish Historical Exhibition in West End Park. In Edinburgh, the fine new chapel of the Order of the Thistle, under construction for two years, as an addition to the south transept of St. Giles Church, was completed and consecrated (Sir R. S. Lorimer). Other architectural notes from Great Britain are the establishment at Birmingham of a new university lectureship in town planning, and the appointment thereto of Mr. Raymond Unwin; the filing of seven applications for new civic plans under the Town-Planning act; much activity in suburban and garden-city development schemes at Birmingham, Sheffield, Halifax, Hull, Rochdale, Manchester, Barrow-in-Furness, and other towns; and the restoration of the choir of Dunkeld Cathedral, Scotland.

GERMANY, FRANCE, ITALY. The German architecture of 1911 displays less of the bizarre eccentricity of the *Moderne Kunst* movement than usual, but is characterized by frequent lapses into a dull and heavy style, which is neither classic nor modern. The best designs are those of factories and utilitarian buildings, and in some cases of funereal monuments. The Bismarck monuments have continued to multiply, and the competition drawings for them show almost invariably an extravagant straining after effect which is sometimes brutal and often depressing. The suburban houses built in 1911 were often interesting and full of picturesque character, and their interiors frequently charming in effect and almost always original and striking. Engineering architecture produced some fine projects and executed some highly satisfactory designs for bridges, as at Cologne and Dresden. A few interesting and satisfactory public buildings were completed in 1911 (or in 1910 not hitherto reported): at Berlin a great municipal building on the *Judenstrasse*, by L. Hoffmann, a severe Doric structure with central tower; a picturesque and extensive building in the Zoological Garden for concert hall, restaurant, etc., by Jurgensen and Bachmann; the Kaiser Wilhelm Academy, by

Cremer and Wolfenstein, a simple and dignified semi-classic edifice; by the same an immense edifice for the Admiralty Courts. In unpleasant contrast with these is the Fuggerhaus, containing offices and shops, of clumsy and ineffective architecture (Leschnetzer and Lipp); while on the other hand, the Brandenburger Landversicherungs offices, by H. Röhlde, are an interesting and successful design, and the same may be said of the dignified offices of the Berlin Gas Works, by L. Hoffmann.

At Dresden the International Hygienic Exhibition presented a group of buildings of varying merit by Bender, Mengel, Hohrath, Betzan, and others. The Chamber of Commerce (1910), by Lossow and Kühne, in the same city, deserves mention; and in Munich the very interesting additions to the Bernheimer Company's premises, completed in 1910, the German Museum of Natural Sciences, by Gabriel and Seidle, the new buildings in the Zoological Gardens, and the Customs and Taxes office, by H. Kaiser. Competitions (among many others) were held for a Bismarck monument at Bengenbrück, won by Professor Hahn of Munich; for an international exhibition in 1913 at Leipzig, for which six hundred contestants were entered, won by C. Wachneck of Eilenburg; for the remodeling of the Alt St. Petersplatz at Strassburg; for a savings bank at Bonn; for the laying out of the Parkring at Düsseldorf, and for a Catholic church at Sablon near Metz, won by H. Neuhäus of Berlin. An extensive royal palace was erected at Posen (F. Schwedte of Berlin) in Romanesque style, and a new opera house at Hamburg, costing 2,000,000 marks, by E. Schandt of Berlin. The jubilee celebration of Bozen was the occasion of erecting several ugly blocks of new houses, by G. Notte, a savings bank, and other buildings. The most eccentric *Art Nouveau* product of the year was a skating rink in Berlin on the site of the Admiralty Gardens, by Schwetzer and Deepenbrock, with Doric columns fifteen diameters high.

Vienna erected a number of highly interesting buildings in various phases of the "New Art": particularly noticeable were a domical church by the veteran Otto Wagner, in a suburb, another domical church in the Central Cemetery, and a city museum, both by Max Hegele, a designer of great taste and resource; a building for a women's industrial society, by Paul Hoppe, and the beginning of a new concert hall and academy of music. Synagogues, municipal tenements of excellent design, asylums, banks and theatres, were reported from Trieste, Prague, Budapest, and other Austrian cities. At Budapest the manifestations of the New Art were particularly virulent, though its chief apostle, Bela Lajta, is a designer of undeniable, if misdirected, talent.

There is little to report from France, where only a moderate building activity has existed. Private houses, theatres, banks, and hospitals, a few churches and business buildings, form the bulk of the year's work, but there was little or nothing of forthcoming importance reported in the architectural journals. In Italy the jubilee exhibitions at Rome and Turin were disappointing architecturally, and the foreign pavilions at Rome particularly so. The American pavilion of modest and almost homelike plainness, but refined in details, was in striking contrast to such eccentricities as the Austrian and some others of the pavilions. The great

national Victor Emmanuel monument was nearly completed, the colossal equestrian statue of the king, by Chiaradia, was set up and the monument formally dedicated. The new Victor Emmanuel Bridge was opened to the public. The eighth International Congress of Architects was held in the Palace of the Capitol, which, with its neighboring palaces, as well as the Castle of Sant' Angelo (Hadrian's tomb) were made parts of the exhibition. At Messina a new temporary town was built, with rows of timber-framed stuccoed houses, and a Royal Commission appointed to lay out the new city for permanent construction.

Elsewhere in Europe there was no remarkable activity. Competitions were held in Athens for a new court house, in Sofia (Bulgaria) for a new prefecture; at Constantinople, new buildings for the American Robert College, with a new layout for the grounds, were begun or carried on, including a steel frame engineering building, the first of its kind in the empire, and new buildings for the American Girls College (by Rutan of Boston).

THE UNITED STATES. The year 1911 was a normal year as to the volume and importance of the work undertaken, carried on, or completed. The total volume was enormous. In New York alone the permits for new buildings totaled an estimated cost of between \$150,000,000 and \$200,000,000. Only the most important works can be mentioned. In New York the completed choir of the Cathedral of St. John the Divine was dedicated, the palatial Public Library was completed and opened to the public, the Merchants and Manufacturers' Exchange was completed and other parts of the colossal group of the buildings of the New York Central Railway Terminal were advanced towards completion (Warren and Wetmore, Reed and Stem); the many-storied municipal offices continued, the steel frame being completed (McKim, Mead & White); the 760 foot Woolworth building by Cass Gilbert was begun; the corner-stone was laid of the imposing new St. Thomas Church, on Fifth Avenue, by Cram, Goodhue & Ferguson; several great hotels completed or carried forward towards completion (Hotels Rector, Ritz-Carlton, Vanderbilt, Alpine, addition to the Martinique); several theatres were completed in Manhattan, Brooklyn, and Jersey City (Cohan, Playhouse, Folies Bergère, National, Shubert, Orpheum); a new Roman Catholic church was dedicated—the Holy Trinity, by J. H. McGuire, with an interesting dome in Guastavino vaulting; the new South Church (Reformed), on Park Avenue, by Cram, Goodhue & Ferguson, was opened, an interesting Perpendicular Gothic design; and several new blocks of sanitary tenements—the Vanderbilt, Shively, etc. At Philadelphia the new Wanamaker store extension by D. H. Burnham was completed; also the new Rush Hospital, by Brockie & Hastings; the new Philadelphia Hospital, by Johnson, Wilson, Harris & Richards; and the Church of St. Francis of Sales, by H. Dagitt, was advanced towards completion. The third National Town-Planning Conference was held at Philadelphia in May. At Chicago the fine new Northwestern Terminal was completed and opened. At Washington commissions for preliminary studies for the Lincoln national monument were given to Henry Bacon and to J. R. Pope of New York; and at San Francisco Messrs. Polk, Faville and Ward

FRONT ELEVATION OF THE "TEMPLE OF JUSTICE" FOR THE WASHINGTON STATE CAPITOL

ONE OF A GROUP OF MONUMENTAL BUILDINGS TO BE BUILT AT OLYMPIA

From the drawings of the Architects Messrs. Wilder & White, New York

were appointed a commission on plans for the coming Panama Exposition. An important competition for a new capitol at Olympia, Wash., to cost \$5,000,000, resulted in the award of the first prize to Wilder & White of New York. The United States government held competitions for post offices in New Haven, Conn., Newark, N. J., and other places, began the erection of a great post office at New Orleans (Hale & Rogers), and advanced the work on the new post office at New York (McKim, Mead & White). The United States court house at Cleveland (A. Brunner), the State Library and Supreme Court at Hartford (D. Barber), the Mahoning county court house at Youngstown, O., by Mosley & Boucherle, and a new municipal building at Trenton, N. J. (S. Roberts), were completed. There was much building activity in the South; new railway terminals and business blocks, hotels, etc., were erected at Norfolk, Va., New Orleans, La., Nashville and Chattanooga, Tenn., Birmingham, Ala., Atlanta, Ga., and other cities. Many universities and colleges added new buildings, Princeton in particular with its new Holder Tower and dormitories and new graduate school, and Columbia with its new Hall of Philosophy and Avery Library and School of Architecture. The building of country houses, large and small, was in the aggregate enormous; particularly noticeable was the work done in the suburbs of Philadelphia and the improvement in domestic architecture in the South. Fireproof construction even for houses of modest size and cost was increasingly common.

ELSEWHERE. Australia has determined to build a new capital city at Yass-Canberra and has opened an international competition for the planning of the new city. At Wellington, New Zealand, a new parliament building has been begun from plans by John Campbell the government architect, and Claude Paton. There has been great activity in South Africa, especially at Pretoria, the capital, and at Johannesburg. At the capital the imposing new government buildings on Meintjes Kop, by H. Baker, have been completed and a new railway station, college and normal school begun or carried on. The new Courts of Justice at Johannesburg were nearly finished and at the same place a memorial was begun to the Rand regiments (E. L. Luytens) and several large stores and warehouses completed. At Durban and Maritzburg also there was much building. (See SOUTH AFRICA.) For the necrology of architects, see NECROLOGY.

ARCTIC EXPLORATION. See POLAR RESEARCH.

ARGENTINA. A federal republic on the South Atlantic coast of South America. Capital, Buenos Ayres.

AREA, POPULATION, ETC. The estimated area of the fourteen provinces, ten territories, and the federal district is 1,139,000 square miles. The census of 1895 showed a population of 3,954,911; official estimate of December 31, 1909, 6,805,684; December 31, 1910, 7,121,822 (exclusive of some 30,000 uncivilized Indians). On the latter date the federal district (city) of Buenos Ayres had an estimated population of 1,329,697; province of Buenos Ayres, 1,796,320; Córdoba, 572,898; Entre Ríos, 415,916. Estimated population of larger cities in 1911, Rosario, 201,268; in 1910, La Plata, 97,000; in 1909, Córdoba, 95,003; Tucumán, 66,000; Santa Fé, 48,000; Mendoza, 39,000; Bahía Blanca, 37,775. Immigration and

emigration in 1909, 278,148 (of whom 93,528 were Italians and 86,798 Spaniards) and 137,508; in 1910, 89,640 and 97,845. Primary instruction is free, secular, and nominally compulsory. In 1909 children of school age numbered 1,200,212 of whom forty-five per cent. attended school. Of the latter only thirteen per cent. could read and write. Of the total population over six years of age 50.5 per cent. were illiterate. The state religion is Roman Catholicism, but religious toleration prevails.

INDUSTRIES. Area under cultivation in 1909-10, about 19,500,000 hectares, of which 5,836,500 wheat, 3,005,000 corn, 1,455,600 linseed, 4,706,530 alfalfa, 572,000 oats, about 2,100,000 cultivated grass. Yield of wheat, linseed, and oats in 1909-10 in metric tons:

Provinces	Wheat	Linseed	Oats
Buenos Ayres.....	1,340,299	281,762	495,745
Córdoba	1,240,528	110,541	4,982
Santa Fé.....	470,077	207,500	4,366
Entre Ríos.....	154,508	100,697	10,799
Pampa Central	300,212	15,615	10,679
Other	60,000	500	3,000
Total	3,565,626	716,615	529,571

Areas of the leading crops in thousands of acres:

	Wheat	Corn	Linseed	Oats
1907-8	14,233	6,719	3,438	702
1908-9	14,982	7,349	3,791	1,565
1909-10	14,422	7,425	3,597	1,415
1910-11	15,452	7,945	3,716	1,980

Other crops include grapes, sugar-cane, barley, potatoes, millet, and beans. Livestock (1910): Cattle, 29,124,229; horses, 7,537,765; mules and asses, 750,167; sheep, 67,383,952; goats, 3,946,750; swine, 1,404,281.

The leading industrial business is meat-packing, carried on in the River Platte region. Manufactures include flour, butter, cheese, sugar, beer and wine. In 1910 there were 31,988 factories, with a capital of 727,591,135 pesos currency and an annual output of 1,227,549,196 pesos; persons employed, 329,490. Of the factories, 10,427, with 118,435 employees, were in the federal district.

COMMERCE. Imports and exports, exclusive of coin and bullion, in gold pesos (one peso = 96.5 cents):

	1900	1905	1909	1910
Imports	113,485	205,154	302,756	351,771
Exports	154,600	322,844	397,351	372,626

Imports and exports of coin and bullion in 1909, 67,454,000 and 1,247,000; in 1910, 37,028,000 and 1,670,000. Leading classified imports in 1909 and 1910 in thousands of pesos: Textiles, 59,924 and 68,365 (cotton, 38,731); iron and steel and manufactures, 36,575 and 43,119; vehicles and railway equipment, 31,711 and 35,095; building materials, 28,366 and 29,237; coal, stones, earths, earthenware, etc., 21,758 and 29,237; food products, 23,015 and 27,141; agricultural implements and machinery, 16,652 and 18,922; wines, liquors, etc., 13,410 and 14,951; oils, etc., 11,853 and 13,892; metals and manufactures (other than iron and steel), 10,211 and 12,870; chemical products, etc., 10,203 and 12,290.

Classified exports in thousands of pesos:

	1908	1909	1910
Agricult. products.....	241,677	230,504	196,582
Pastoral products.....	115,118	153,548	161,007
Forest products.....	6,347	8,927	10,565
Fish and game.....	499	752	1,429
Mineral products.....	811	743	540
Miscellaneous	1,553	2,876	2,505
Total	366,005	397,351	372,626

Of the agricultural exports in 1910 raw products were valued at 186,317,291 pesos; manufactured products, 5,109,192; by-products, 5,155,136. Of the pastoral reports, ordinary animal products, 135,033,322; manufactured, 18,286,237; by-products, 2,831,327; live animals, 5,055,706. Leading exports in thousands of pesos:

	1900	1908	1909	1910
Wheat	48,628	128,843	106,039	72,202
Corn	11,934	41,557	58,374	60,261

Total incl. other	302,756	351,771	397,551*	372,626*

* These totals include grain shipments "for orders," i. e., not recorded at the Argentine ports as for any particular country, but subject to cable or other orders sent to the first port at which the vessel touches. Such shipments were valued at 135,425,696 pesos in 1908, 117,837,922 in 1909, and 103,783,235 in 1910.

COMMUNICATIONS. The first railway in Argentina was opened in August, 1857, extending twelve kilometers from Buenos Ayres. The length of railways had increased to 249 kilometers in 1865, 732 in 1870, 2516 in 1880, 9432 in 1890, 16,563 in 1900, 19,794 in 1905, 23,508 at the end of 1909, and 28,636 (18,166 miles) at the end of 1910. Of the latter number 3971 kilometers were government line, with a capital of 107,300,-

000 pesos gold, while the capital of the private lines was 874,049,000 pesos gold.

The important works of the year 1911 were the Port Argentine line of the Great Central Railway, an extension to Salado River from Bagnal of the Buenos Ayres Western Railway, a distance of 62 miles across the provinces of San Luis and Mendoza to Alvear; and the construction of a further section of the La Plata-Meridiano Quinto Railway, amounting to 180 miles. Telegraph lines reported for end of 1909, 60,903 kilometers, with 154,966 of wire. Post offices, 2953.

FINANCE. The unit of value is the gold peso, worth 96.5 cents. The paper peso, under the conversion law of 1899, is valued at .44 of the gold peso. Revenue for 1910 (gold revenue being reduced to paper), 304,679,200 pesos paper, as against 274,526,578 in 1909, 254,232,013 in 1908, and 205,341,838 in 1905. Import duties in 1910, 76,033,647 pesos gold (equivalent to 172,803,743 pesos paper). The budget for 1912, as submitted to the congress by the minister of finance, showed estimated revenue of 89,2881,681 pesos gold, 144,016,719 pesos paper, and 15,750,000 pesos paper in bonds (the total being equivalent to 362,679,631 pesos paper); estimated expenditure, 29,881,303 pesos gold, 281,445,183 paper, and 13,250,000 paper in bonds (total 362,607,236 paper). The larger items of estimated expenditure: Public debt, 28,528,982 pesos gold and 14,739,573 paper; justice and public instruction, 45,776,504 paper; interior, 43,790,135 paper; war, 29,329,905 paper; navy, 23,029,672; public works, 18,500,006; agriculture, 17,959,076; finance, 17,858,582.

Public debt, December 31, 1910: External, 308,554,074 pesos gold; internal, 92,536,900 gold and 121,534,230 paper; floating, 34,064,123 paper. Paper currency outstanding, 685,150,000 pesos. In June, 1911, a contract was made with a syndicate, composed chiefly of French and Belgian bankers, for a loan of 70,000,000 pesos gold, the proceeds to be applied principally to public works and railways.

ARMY. Service in the army of the Argentine Republic is obligatory under the provisions of the law of September 28, 1905, as modified in 1907. This statute requires personal service of every citizen between the ages of 20 and 45, of which ten years should be spent in the active army or its reserve, with one year of actual service with the colors, ten years in the national guard, and five years in the territorial army. This law is not rigorously enforced, and as a result the actual peace strength is about 15,000 men, though a scheme of mobilization provides for a war strength of about 250,000 men. On a peace footing the active army is divided into five territorial divisions. The forces include ten regiments of infantry, each of two battalions formed of two or three companies, and ten battalions of infantry of three companies each; nine regiments of cavalry, each of four squadrons; five regiments of field artillery of four batteries each; one section of field howitzers of two batteries; two sections of mountain artillery of three batteries; one machine gun battery; one section of heavy artillery; five battalions of engineers; one battalion of railway troops, five companies of train, and a hospital corps. The infantry is armed with the Mauser rifle, the model of '91, and a carbine of the same system and cali-

bre is used by the cavalry. The artillery have Krupp guns, calibre 75 millimeters, rapid-fire howitzers of 115 millimeters calibre, and rapid-fire siege guns of 130 millimeters calibre. According to the budget of 1911, the effective strength of the regular army on a peace basis was three major-generals, twelve brigadier-generals, fifty-two colonels, 130 lieutenant-colonels, 130 majors, 222 captains, 320 first lieutenants, 280 lieutenants, 300 sub-lieutenants, and 20,082 enlisted men. Of the various soldiers making up the war effective strength of 170,000 men, about 128,000 have received preliminary training varying from three months to two years. In addition, the national guard includes an effective strength of 215,000 men, of which about 90,000 have received military instruction; therefore the total war strength of the republic on mobilization would be represented by about 2,600,000 men from 20 to 40 years of age. The territorial troops embrace about 68,000 men.

NAVY. The navy in 1911 included four armored cruisers (aggregating 27,400 tons); two armored coast-guard vessels (4800); one old armored coast-guard (4200); two coast-guards (3070); three protected cruisers (11,440); two torpedo cruisers (1776); two armored river gunboats (2000); three torpedo-boat destroyers (1020); twelve first-class torpedo boats (969); nine second-class torpedo boats (144); 6 transports (29,243); and several auxiliary vessels. The foregoing list does not include any vessels of the new Argentine programme, which provides for two large battleships and twelve destroyers and authorizes, if required, a third large battleship and four additional destroyers. Construction of these latter vessels is contingent on Brazil's naval activity. The two new battleships were launched in 1911, the *Rivadavia* at Quincy, Mass., on August 26, and the *Moreno* at Camden, N. J., on September 23. Both vessels were due for completion in 1912. Of the new torpedo boats, four were launched in Birkenhead, England, in 1911 and completed before the end of the year. Of the others, four were under construction in Germany and four in France. The *Rivadavia* and *Moreno* have each a displacement of 28,000 tons; designed speed, 22½ knots; length between perpendiculars, 575 feet; beam, 95 1-2 feet; draft, 28 feet; battery, twelve 12-inch and twelve 6-inch guns; torpedo tubes, 2; maximum thickness of armor belt, 12 inches; complement, 1050. See **BATTLESHIPS.**

GOVERNMENT. President in 1911, Roque Sáenz Peña (inaugurated for the six-year term, October 12, 1910; vice-president, Victoriano de la Plaza.

HISTORY. Diplomatic relations between Argentina and Bolivia, which had been interrupted as a result of the boundary disputes, were resumed in January, through the good offices of the United States. Much distress was caused early in the year by the failure of the corn crop owing to a prolonged drouth, and many laborers were obliged to leave the country. The scarcity of agricultural labor was intensified by the Italian government's prohibition of emigration to Argentina on account of a quarrel over sanitary regulations. The Argentine government had introduced a number of sanitary reforms as regards immigrants and some of them seemed to bear with especial severity upon Italians. Italy's retaliatory stoppage of emigration caused much indignation in Argentina, where

it greatly reduced the labor supply in the harvest season. An attempt was made to get farm laborers from England. The immigration law of 1911 excluded all but able-bodied immigrants and held the steamship companies responsible for violations. A new loan was announced in June for \$70,000,000 to defray the expenses of the schools, colleges, and federal offices. A mission was sent from Amherst College to make a biological survey in Patagonia, and a German expedition was undertaken to explore the Andes for geological purposes and also to ascertain the possibilities of commercial development. Extensive dams for irrigation were formed by the government. In November it was announced that a British company had bought up fourteen out of the eighteen cigarette factories in the country. General arbitration treaties were signed in July with Ecuador and Venezuela and a similar treaty with Colombia was promised. In December Congress approved the boundary agreement with Bolivia. At the close of the year dissensions arose in the cabinet, causing the resignation of the minister of agriculture.

ARGON. See **CHEMISTRY.**

ARHOVIN. A solution of diphenylamine and thymol benzoate in ethyl benzoate, the three constituents being in molecular proportions. It is a yellowish liquid, having an aromatic odor and a pungent taste; almost insoluble in water but easily soluble in alcohol, ether, chloroform, and fatty oils. On account of its taste it is best administered in capsules. The drug is a urinary antiseptic and is found in this fluid fifteen minutes after ingestion. It is said to be useful in the treatment of urethritis, prostatitis, cystitis, and pyelitis, and externally as a substitute for the silver salts.

ARID LANDS. See **IRRIGATION.**

ARIZONA. **POPULATION.** The total population of the State in 1910 was 204,354 as compared with 122,931 in 1900, an increase of 56.2 per cent. in the decade. The largest towns with their population in 1910 were as follows: Tucson, 13,193; Phoenix, 11,134; Bisbee, 9019; Globe, 7083; Douglas, 6437; and Prescott, 5092.

AGRICULTURE. The Thirteenth Census included statistics of agriculture in the State. They are of date April 15, 1910. On that date the farms numbered 9227, compared with 5809 in 1900. The land in farms was 1,246,613 acres, compared with 1,935,327 acres in 1900, a decrease of 688,714 acres. The improved land in farms was 350,173 acres, compared with 255,521 acres in 1900, an increase of 95,652 acres. The average acres per farm was 135.1 compared with 332.2 in 1900. Farm property including land, buildings, implements and machinery, domestic animals, poultry, and bees were valued at \$75,123,970, as compared with a value in 1900 of \$29,993,847, an increase of \$45,130,123 or 150.5 per cent. in the decade. The average value of property per farm was \$8142 compared with a value in 1900 of \$5163. The average value of land per acre was \$33.97 compared with \$5.90 in 1900, an increase of 475.8 per cent. Of the total number of farms in the State in 1910 8366 were operated by owners and managers and 861 by tenants. The farms free from mortgage numbered 70,388 and those under mortgage 1043. The native white farmers numbered 5218; foreign-born white, 806; negroes and other non-whites, 3203. The non-white farmers included 3159 Indians, 24 Chinese, 12

negroes, and 5 Japanese. The value of the various kinds of domestic animals, and poultry and bees in 1910 was \$26,050,870 as compared with \$15,514,687 in 1900. The cattle numbered 824,970, valued at \$14,824,708; horses and colts, 99,578, valued at \$4,209,726; mules, 3963, valued at \$399,447; swine, 17,208, valued at \$113,714; sheep and lambs, 1,226,733, valued at \$4,400,513. The acreage, production, and value of the principal crops in 1910-11 are shown in the following table:

	Acreage	Prod., bu.	Value
Corn1911	15,000	495,000	\$480,000
.....1910	15,000	488,000	537,000
Wheat1911	27,000	800,000	760,000
.....1910	27,000	603,000	724,000
Oats1911	6,000	252,000	151,000

Hay1911	130,000	502,000	6,024,000
.....1910	116,000	244,000	3,172,000
a Tons.			

MINERAL PRODUCTION. The total value of the mineral production in 1910 was \$43,483,912. Of this value copper produced almost the entire amount.

The State ranks first in the production of copper, and although there was a decrease in 1910 over the preceding year, this position was maintained. There were produced in 1910 297,481,151 pounds, valued at \$37,781,376, as compared with 303,899,461 pounds, valued at \$39,506,930, in 1909. Of the copper produced 59,425,058 pounds were produced from concentrate the year. The Globe-Miami district produced from crude ores sent to the smelters. In 1911 the State again held first rank among the copper producing States, but the output hardly equalled that for 1910, namely, 297,250,000 pounds. The largest producer was the Bisbee district with an output of 133,000,000 pounds, a marked decrease from the output of 1910, 142,500,000 pounds. Part of this decrease was due to the stopping of shipment by the Shattuck-Arizona mine during the latter part of the year. The Gobe-Miami district produced about 40,000,000 pounds as compared with 27,600,000 pounds in 1910. This increase was in the Miami area. In the Jerome district the output of the United Verde mine showed a slight decrease from the 38,660,000 pounds produced in 1910. The State is also a large producer of zinc. The production in 1910 was 5,484,899 pounds, valued at \$296,184 as compared with 5,977,237 pounds, valued at \$322,771, in 1909. The production of lead in the State in 1910 was 2,696,998 pounds, valued at \$118,688, compared with 3,098,083 pounds valued at \$133,218 in 1909. Of the lead produced, 300,268 pounds came from concentrates and 2,393,610 from crude oils sent to the smelters. The total production of gold in the State in 1910 was 152,350 fine ounces, valued at \$3,149,366, an increase in value of \$411,866 over the value of the product of 1909. Of this output 1,257 fine ounces came from placer mines, 95,359 fine ounces from siliceous ores, and 52,707 fine ounces from copper ores. The silver production in 1910 was 2,506,528 fine ounces valued at \$1,385,925 as compared with \$2,607,161 fine ounces valued at \$1,352,604 in 1909. Of the silver output 1,934,363 fine ounces came from

copper ores, 440,120 fine ounces from siliceous ores and 119,034 from lead ores.

According to the estimates of the Director of the Mint the production of gold in the State in 1911 was 142,938 fine ounces, valued at \$2,954,790, a decrease over the production of 1910. The silver mined was 1,594,438 fine ounces, valued at \$876,935. This is a considerable decrease over the production of 1910.

MANUFACTURES. The Thirteenth Census included statistics relating to the manufactures of the State, and its principal results are given in the table below. These figures are for the calendar year 1909. In general, this table brings out the fact that the manufacturing industries of Arizona, as a whole, showed a considerable development in the last five years. The percentage of increase, as will be seen, is 84. Of the persons engaged in manufactures, by far the larger number are found employed in the smelting and refining of copper, which is the leading manufacturing industry of the State. In this are employed 3129 wage earners. No other industry employs any considerable number of men except those engaged in work for railroad companies in general shop construction of cars and repairs. These number 1089. In lumber and timber products 831 men were employed, and in printing and publishing, 268. Other industries of the State are flour mills and grist mills, lumber and timber products, and ice manufacture. Of the total number of persons employed in the various industries, 5.9 per cent. were proprietors and officials, 4.6 per cent. clerks, and 89.4 per cent. wage earners.

The following table gives a summary of the results of the census for the calendar years 1909 and 1904.

	Number or amount 1909	1904
Number of establishments	311	169
Persons engaged in manufactures	7,202	5,217
Proprietors and firm members	261	133
Salaried employees	500	291
Wage earners (average number)	6,441	4,793
Primary horsepower	39,140	21,412
Capital	\$32,878,000	\$14,396,000
Expenses	41,131,000	20,244,000
Services	6,303,000	4,441,000
Salaries	798,000	472,000
Wages	5,505,000	3,969,000
Materials	33,600,000	14,695,000
Miscellaneous	1,228,000	1,208,000
Value of products	50,257,000	28,083,000
Value added by manufacture (value of products less cost of materials)	16,657,000	13,488,000

POLITICS AND GOVERNMENT

The year 1911 marked the practical passing of Arizona from a territorial to a State form of government. While at the end of the year the concluding steps had not actually been taken, it had been assured to such an extent that there was no doubt that Arizona would be promptly admitted among the States. Provisions for the admission of Arizona and New Mexico were made by the second session of the First Congress and approved June 20, 1910. A constitutional convention was held in 1910 which formulated a constitution for the prospective State. This act contained several provisions of a radical

nature. It was, however, on February 7 ratified by the people of the Territory. Previous to this action the document had received sharp criticism from President Taft and others for certain of its features. The provision most severely criticised was that providing for the recall of the judiciary. Among other provisions were those for the initiative and referendum, for amendments to the constitution by a majority vote of the people upon the initiative of 15 per cent. of the voters, for the recall of all elective officers, for direct primaries, for a direct advisory primary for United States Senators, an anti-lobbying clause, a non-partisan election of the judiciary, for a rigid corporation regulation, with a provision designed to abolish "wildcatting," for physical valuation of railroads as a basis for rate regulation, for a corporation commission with wide powers and for an employers' liability provision for abrogating the fellow servant doctrine, and the elimination of probate courts. The proposed constitution was ratified by a vote of about 12,000 to 3500. At the first session of the Sixty-second Congress a joint resolution was passed providing for the admission of Arizona and tacitly admitting the right of its people to formulate as radical a constitution as they wished. This joint resolution was vetoed by President Taft on account of his disapproval of the provision concerning the recall of judges contained in the Arizona constitution. He declared that the recall, as applied to county and State judges, can be destructive of independence in its judiciary, likely to subject the rights of the individual to the possible tyranny of the popular majority, and therefore injurious to the cause of free government. The government is for all the people and not solely for a majority of them; the majority in exercising control . . . is bound to exercise the power for the benefit of the minority as well as for the majority. But all have recognized that the majority of a people unrestrained by law, when aroused and without the sobering effect of deliberation and discussion, may do injustice to the minority or to the individual when the selfish interest of the majority prompts. Hence arises the necessity for a constitution by which the will of the majority shall be permitted to guide the course of the government only under controlling checks that experience has shown to be necessary to secure for the minority its share of the benefit to the whole people that a popular government is established to bestow . . . No honest, clear-headed man, however great a lover of popular government, can deny that the unbridled expression of the majority of a community converted hastily into law or action would sometimes make a government tyrannical and cruel. Constitutions are checks upon the hasty action of the majority. . . . In a proper sense, judges are servants of the people; that is, they are doing work which must be done for the government and in the interests of all the people. But it is not work in the doing of which they are to follow the will of the majority, except as that is embodied in statutes lawfully enacted according to constitutional limitations. The President admitted that some judges have rendered not only unpopular but unjust decisions, and that others have showed themselves to be under corrupt influences. But he insisted that a system of legalized terrorism should not be substituted for individual injustices. He de-

clared further that self-respecting men would hesitate to accept office with such a sword of Damocles hanging over them. The proper remedy for dishonest and corrupt judges, he declared, would be found in a more effective system of impeachment in which the opportunity for judicial hearing and defense before a tribunal might be retained.

Following the President's veto another joint resolution was introduced and passed. This provided for the admission of Arizona upon an equal footing with the original States upon condition that the provision for the recall should be eliminated from the constitution. It was, therefore, incumbent upon the voters in the Territory to consent to an amendment to the constitution eliminating the judicial recall provision. This election was held on December 12, 1911, and included the election of a full State ticket and a member of Congress. An advisory vote was also taken for two United States Senators. Members of the legislature are obliged to elect these candidates at the first session of the State legislature to be held in 1911. The two candidates receiving the largest number of votes and therefore the first Senators from Arizona were Marcus Smith, who served the Territory during eight terms as delegate to Congress, and Henry Ashurst. The vote to eliminate the objectionable amendment to the constitution was practically unanimous.

Previous to this election the first primary for the nomination of State officers had been held on October 24. The candidates for nomination for governor were G. W. P. Hunt and Thomas F. Weedon, Democrats, and E. W. Wells and George W. Young, Republicans. At the election on December 12, the Democrats elected the entire State ticket and a majority of the legislature.

Following its admission as a State, the legislature has the power to reincorporate in its constitution the feature objected to by President Taft; and as it is conceded that a majority of the members of the legislature are in favor of the provision for the recall of judges, it was assumed that the measure would be restored to the constitution at the first opportunity.

OTHER EVENTS. On March 18 the great Roosevelt storage dam was officially opened by Theodore Roosevelt. This is one of the highest dams ever built, being upward of 283 feet, 8 inches. It is 168 feet thick at the base, and 20 feet at the crest, which extends 1080 feet. It is part of the reclamation work being carried on by the government in arid regions. It is situated in what has been one of the desert regions of the world. The water which it imprisons flows into Salt River, which, for the greater portion of the year, contains little water. In the spring, however, when the snow on the mountain ranges has melted, this stream has become a great torrent. The Roosevelt dam imprisons this overplus of water and transforms it into a great lake, the largest artificial lake, it is said, in the world. It is estimated that the water from the mountains and from the subterranean supply which is available will reclaim considerably more than 200,000 acres of land. The work was begun under the administration of President Roosevelt and he made an address at the opening of the dam.

TERRITORIAL GOVERNMENT IN 1911. Officers prior to December 12, 1911: Governor,

Richard E. Sloan; Secretary, George U. Young; Treasurer, E. E. Kirkland; Auditor, W. C. Foster; Adjutant-General, L. W. Coggins; Attorney-General, John B. Wright; Superintendent of Education, Kirke T. Moor; Commissioner of Insurance, George U. Young—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, Edward Kent; Associate Justices, L. W. Lewis, Fletcher M. Doan, John H. Campbell, Edward M. Doe; Clerk, F. A. Tritle, Jr.—all Republicans.

ARKANSAS. POPULATION. The total population of the State in 1910, according to the Thirteenth Census, was 1,574,449, as compared with 1,311,564 in 1900. The principal cities with their populations in 1910 and 1900 are as follows (the figures in parentheses are for 1910): Little Rock, 95,941 (38,307); Ft. Smith, 23,975 (11,587); Pine Bluff, 15,102 (11,496); Hot Springs, 14,434 (9793); Aregenta, 11,138.

AGRICULTURE. The acreage, production, and value of the leading crops in 1910 and 1911 are as follows:

	Acreage	Prod., bu.	Value
Corn1911	2,390,000	49,712,000	\$35,793,000
.....1910	2,390,000	57,360,000	33,269,000

MINERAL PRODUCTION. The total value of the mineral products of the State in 1910 was \$5,350,705. In addition to coal, which was the most important product, clay products were valued at \$578,455; lead, \$127,068; stone, \$382,611.

The production of coal in the State in 1910 was 1,905,958 short tons, with a value of \$2,979,213, a decrease of nearly one-fifth from the tonnage of 1909. The coal-mining industry of the State was practically at a standstill for six months during the year. The strike which began on April 1, and lasted until September 15, affected nearly all of the coal-mining employees in the State. There were 5568 men employed in the coal mines in 1910 and there were 4873 men on strike.

EDUCATION. The enrollment in the schools of the State for the year ending June 30, 1911, was 404,760. The average daily attendance was 255,405. The number of teachers employed was 9834. The total value of school property was \$7,872,856. There were erected during the year 302 new school buildings. The total expenditure for the year for education was \$3,610,132. Many important measures relating to education were passed at the legislative session of 1911. Among these was one providing for a State board of education. As a result of measures passed in recent years, compulsory school attendance is now effective in forty counties.

CHARITIES AND CORRECTIONS. The charitable

and correctional institutions of the State with their populations in 1911 are as follows: State Hospital for Nervous Diseases, Little Rock, 1120; Deaf Mute Institute, Little Rock, 243; School for the Blind, Little Rock, 113; Confederate Soldiers' Home, Sweet Home, 74; Arkansas State Penitentiary and State Farm, 840; Arkansas Reform School, Little Rock, 53. The State charitable institutions are controlled by the Board of Trustees of Charitable Institutions and the correctional institutions by the State Penitentiary Commissioners.

POLITICS AND GOVERNMENT

The State legislature was in session twice during 1911. A regular session and a special session were held. See paragraph *Legislation* below. There were no elections in the State during the year. On January 24 the lower house of the legislature ratified the proposed income tax amendment. On March 7 this resolution was defeated by the senate, but on April 17 that body reversed itself and voted for its ratification. A proposed amendment to the State constitution for the so-called "grandfather clause," which follows in general similar clauses in the constitutions of some other Southern States, will be voted on by the people at the September, 1912, election. There will also be submitted to a vote of the people a proposed amendment to the constitution exempting from taxation for seven years capital invested in cotton manufactories.

A bill providing for a revision of the revenue system of the State will be submitted to the people at the September, 1912, election under the referendum, the initiative and referendum having been put into the Arkansas constitution by the amendment adopted in September, 1910. Plans are being made for submission to the people at the September election through the initiative of a bill providing for statewide prohibition. The Democratic primary will be held on March 27. Governor George W. Donaghey is a candidate for nomination for a third term and he is opposed by Congressman Joe T. Robinson. Senator Jeff Davis is a candidate for nomination for a second term. He is opposed by former Congressman S. Brundidge.

LEGISLATION. A regular and a special session of the legislature were held in 1911. At the special session an act was passed carrying into effect a constitutional amendment providing for the initiative and referendum. At the regular session no laws of unusual importance were passed, excepting a measure providing for a juvenile court and one creating a State board of education. A measure was passed making railroad companies liable to anybody suffering injury by death to an employee.

STATE OFFICERS. Governor, George W. Donaghey; Lieutenant-Governor, W. J. Rodgers; Secretary of State, Earle W. Hodges; Treasurer, John W. Crockett; Auditor and Insurance Commissioner, J. R. Jobe; Attorney-General, Hal L. Norwood; Superintendent of Education, George B. Cook; Commissioner of Agriculture, Clay Sloan; Commissioner of Public Lands, R. G. Dye—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, Edgar A. McCulloch; Justices, Samuel Frauenthal, C. D. Wood, William F. Kirby, and Jesse C. Hart; Clerk of the Court, P. D. English—all Democrats.

STATE LEGISLATURE, 1911. Democrats: Senate 34; House, 95; joint ballot, 129. Republi-

cars: Senate, 1; House, 5; joint ballot, 6. Democratic majority: Senate, 33; House, 99; joint ballot, 123.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

ARKANSAS (BATTLESHIP). See BATTLESHIPS.

ARKANSAS, UNIVERSITY OF. An institution of higher learning, founded in 1871, at Fayetteville, Ark. It is supported by the State. The number of students enrolled in the various departments of the university in 1910-11 was 1540. The faculty numbered 155. There were no notable changes in the faculty during the year. The income of the university is derived almost entirely from the State. It amounts to about \$140,000 per year. The library contains about 15,000 volumes. The president is John M. Tillman, LL. D.

ASBESTOS. The asbestos industry in the United States has steadily increased in recent years. The total production for 1910 was 3693 tons, valued at \$68,357, an increase of 20 per cent. in quantity and 9 per cent. in value over the production of 1909. There are four States producing asbestos, Georgia, Idaho, Vermont, and Wyoming. Georgia and Idaho produce the amphibole variety and Vermont and Wyoming the chrysotile.

Canada is the most important source of the raw asbestos used in the United States. Canadian exports for the calendar year 1910 were 71,485 short tons, valued at \$2,108,632, and of this by far the greater part was exported to the United States. The total quantity of all the asbestos unmanufactured imported into the United States in the calendar year 1910 was 52,888 long tons, valued at \$1,285,171. In addition to Canada, small amounts were imported from Germany, Italy, Russia, and the United Kingdom.

Increased demand for asbestos fabrics, insulating tapes, and more especially for friction facing in automobile brakes, and for steam packings of all descriptions, has been remarkable in recent years. The higher grades are also used for leggings and shoe coverings among workers of molten metal. In Europe the mineral is used for manufacturing tapestry, but in the United States the high grades are used chiefly for steam packing, for which it is largely replacing rubber. The use of low grades for making shingles, slates, and boards or lumber for building purposes, has greatly increased within a few years.

ASHMORE, SIDNEY GILLESPIE. An American educator and scholar, died May 22, 1911. He was born in London in 1852. When he was

six years of age his family removed to New York City. He studied under private tutors and in 1872 graduated from Columbia College. He was appointed instructor in Greek and Latin at Lehigh University in 1873. Here he remained until 1876 when he became instructor of Latin in Columbia College. In 1881 he was appointed professor of Latin at Union College. His published works include a widely used edition of the plays of Terrence, and editions of *Cæsar's Helvetic War*, and *Invasion of Britain*. He also wrote *The Classics and Modern Training* (1905) and contributed various articles on literary and educational subjects to periodicals. He was a member of many educational associations and learned societies.

ASQUITH, H. H. See GREAT BRITAIN.

ASSOCIATION OF AMERICAN UNIVERSITIES. A body organized in 1900 for the purpose of considering matters of common interest in relation to graduate study in American institutions. Its membership consists of the following universities: University of California, Catholic University of America, University of Chicago, Clark University, Columbia University, Cornell University, Harvard University, Indiana University, University of Illinois, State University of Iowa, Johns Hopkins University, University of Kansas, Leland Stanford Jr. University, University of Michigan, University of Minnesota, University of Missouri, University of Nebraska, University of Pennsylvania, Princeton University, University of Virginia, University of Wisconsin, and Yale University. The twelfth annual conference of the association was held at the University of Chicago October 26 and 27. In 1908 the association adopted the general conditions under which universities are to be admitted to membership. These included the presence in the institution of a strong graduate school; and, in those institutions which have professional schools in addition to the graduate department, the requirement in at least one such school of one or more years of college work as a prerequisite for admission to professional courses, the combination to be so arranged that no professional degree shall be given until the satisfactory completion of at least five years of study. This action defined for the first time what an American university should be from the standpoint of the most important of them and it places all professional study in America in such institutions ultimately upon a graduate basis, in that it proposes in due time to require that all professional work shall be preceded by college work in the manner indicated. The association publishes each year the proceedings of the annual conference. The officers for 1911-12 are: President, Leland Stanford Jr. University; vice-president, Clark University; secretary, Harvard University; additional members of the executive committee, Columbia University and the University of Indiana. The thirteenth annual conference in 1912 is to be held at the University of Pennsylvania, Philadelphia.

ASSUR, EXCAVATIONS IN. See ARCHEOLOGY.

ASTEROIDS. See ASTRONOMY.

ASTRONOMY. The work of the year 1911 showed steady progress in all branches of astronomical research. No striking discoveries marked the year, though, of the five new comets discovered, three became visible to the naked eye. The discovery of three *novæ* or new stars

was announced; two of these—in the constellation *Sagittarius*—were in a region of the heavens in which no less than seven of these bodies have blazed forth at different times. Elaborate preparations were made for observing the last of the present series of long duration total eclipses of the sun, but with disappointing results. Important advances in our knowledge of the sun were reported from the Mount Wilson Solar Observatory. The opposition of Mars at the end of November gave observers of that planet a favorable opportunity for further study, and many interesting observations of the changes in the topography of its surface were recorded.

THE SUN. From an examination of between 3000 and 4000 prominences recorded on photographs taken at the Yerkes Observatory during the period 1904-1910, Dr. F. E. Slocum made important deductions concerning the circulatory currents in the solar chromosphere. The light of the H calcium line was always used. About one-third of the prominences examined were found to indicate a horizontal current at an average height of 30,000 kilometers. There was a tendency for movement towards the poles in middle latitudes and in high latitudes a tendency for movement towards the equator which was more pronounced in the northern hemisphere than in the southern, while near the equator conditions were almost neutral. It was suggested that the results obtained probably applied to an upper current analogous to the terrestrial anti-trades. Messrs. Abbot and Fowle, using a standard pyrheliometer of new design, announced that their series of measurements of the solar radiation at Mount Wilson during the period 1905-9 gave as the value of the solar radiation constant 1.922 calories ($15^{\circ}\text{C}.$) per sq. cm. per minute, a result which is probably accurate within one per cent.

Mr. A. Cotton, writing in the *Astrophysical Journal*, questioned the legitimacy of applying Doppler's principle without consideration of other facts to the determination of the radial velocity of the sun's parts from the measured displacements of the lines of the solar spectrum.

ECLIPSE OF THE SUN. A total eclipse of the sun took place on April 28. It was visible as a partial eclipse in all parts of the United States south of a line drawn through Philadelphia, Milwaukee, and Portland, Ore. The path of totality extended from the southeast coast of Australia in a northeasterly direction across the Pacific Ocean. As it was the last of the series of long duration eclipses for some years to come, it was deemed sufficiently important to warrant a special attempt to secure observations, both spectroscopic and topographic, and several expeditions were fitted out for this purpose. Three English expeditions were dispatched to Vavau, a small coral island of the Friendly Group in lat. $18^{\circ}39'$ S. and long. $173^{\circ}59'$ W., where the duration of totality was 217 seconds. Besides these, an expedition headed by Dr. L. A. Bauer, the director of the Department of Terrestrial Magnetism of the Carnegie Institution, proceeded to Tau Island, one of the Manua Group of the Samoan Islands; and there were also Australian and German expeditions. On the whole, the results were disappointing, as most of the parties experienced unfavorable weather conditions and were consequently able to secure comparatively few negatives. The corona was reported as of the typical minimum sun-spot type.

The American expedition, which was intended primarily for the purpose of making magnetic observations, was more successful, the astronomical observations being made by the officers of the United States cruiser *Annapolis*, which conveyed the party. Several negatives were obtained showing the inner corona and numerous extensions, some of them extending to a distance of more than half the sun's apparent diameter. The Australian expedition to the island of Lifuka was also favored with excellent conditions for observation and reported that the hydrogen prominences were wonderfully distinct. It has been seriously questioned whether the gain in our knowledge of the sun is worth the expenditure of time and money involved in fitting out so many expeditions of this nature.

MOUNT WILSON SOLAR OBSERVATORY. In his annual report to the Carnegie Institution of the work accomplished at this observatory during 1910, Professor W. S. Adams, the acting director, gave a summary of the principal results obtained by himself and other members of the staff. Among the more important of these results may be mentioned the following: It has become possible to classify the sun-spots according to the properties of their magnetic fields. It was found from photographs taken with the hydrogen α line that the first sign of activity was given by the appearance of bright flocculi in the spot region. With the development of the spot the surrounding disturbance became more marked and was usually followed by the appearance of a vortex structure. The two larger spots lying at the opposite ends of a group were almost invariably found to be of opposite polarity, and in consequence it has been found possible to identify the following classes of H α flocculi, (1) unipolar, (2) bipolar, (3) multipolar, (4) filaments (very dark, long, and narrow), and (5) eruptions (very bright, rapidly changing in form). In the bipolar type the bright flocculi are usually first seen between the spots and resemble in form the lines of force joining the poles of a bar magnet; in the other cases they are closely massed about the spot or group. It is considered that the two principal spots of a bipolar group are the opposite extremities of a single vortex tube. Photographs taken with the hydrogen δ line and the calcium H₁ line showed few instances of the unipolar type and none of the multipolar.

Professor C. E. St. John found, from an extensive investigation of the circulation of the calcium vapor in the solar atmosphere, that the vapor producing the absorption K₂ had a descending motion of about 1.1 km. per second over those portions of the sun's disc which were free from spots and faculae, while the vapor producing the bright line K₃ had an ascending motion of 2 km. per second, both motions being essentially radial. It was suggested that a possible cause of the high radiating power of the emitting layer is to be found in its increased temperature resulting from the transformation into heat of the mechanical energy which is liberated by the loss of velocity in the opposing upward and downward currents. A later communication, published in the *Astrophysical Journal*, extended the inquiry over the regions of spot umbrae and penumbrae and flocculi, and it was found that the emitting vapor in most sun-spots was descending at from .6 to 2.2 km. per second, while in the penumbra it was apparently in a state of vertical equilibrium.

A number of photographs of nebulae and star-clusters were obtained by Mr. Ritchey, who found that the globular star-clusters are composed of scores of thousands of stars, and that their angular diameters are at least three times as great as they appear in the large refracting telescopes. It was estimated there are upwards of 27,000 stars in the *Hercules* cluster alone. The spiral nebulae examined were found to contain great numbers of star-like condensations which may be stars in the process of formation. In general, these condensations lie in streams which follow the spirals of the nebulous matter in which they appear.

Work with the 18-foot spectrograph on the spectra of *Sirius*, *Procyon*, and *Arcturus* gave material for important deductions regarding the physical condition of these stars. Measurements of the photographs indicated that the enhanced lines in the spectra of *Sirius* and *Procyon* were displaced toward the red relative to the arc lines, and the pressure in the reversing layer of *Sirius* was estimated to be 12 atmospheres greater than in the sun's reversing layer, and in *Procyon* 7 atmospheres greater. In the case of *Arcturus* the elements behave spectroscopically in almost the same way as at the sun's limb, so that it is probable that *Arcturus* has a comparatively shallow reversing layer and that within this layer the general arrangement of the gases is similar to that in the sun.

SUN SPOTS. The minimum of the present period of sun-spot activity is approaching, and no noteworthy development of spots was recorded during the year.

From an investigation of the proper motion in longitude in sun-spot groups, Dr. Brunner of Zurich found that, during the early stages of the development of a group, there is a decided tendency for the spots composing the group to separate one from another. He also found that at the maximum epoch of the eleven-year period the motion of the following spots of a group is usually in excess of that of the preceding spots, so that, as a whole, there results a backward displacement of the group upon the sun's disc, but the amount of the displacement is independent of both the phase of the solar activity and the heliographic altitude of the spots.

Schuster has attempted to connect the formation of sun-spots with planetary action, and to that end investigated the relations between the heliocentric longitudes of Mercury, Venus, and Jupiter and the points of the sun's disc at which the sun-spots were started. Some indications of a connection were found. There was a strong minimum of sun-spot formation about an hour before planet-rise on the sun, increasing to a decided maximum about two hours later. This was succeeded by a secondary minimum an hour after planetary noon, rising again to a pronounced maximum a couple of hours later. Other observers have questioned the validity of Schuster's conclusions, and it is evident that further observations extending over a prolonged period will have to be made before the nature of the interdependence, if it exists, can be made out.

JUPITER. Observations on the Red Spot of Jupiter showed a remarkable change in longitude amounting to nearly eight degrees. The spot was also more distinctly visible than it had been for several years previous, and its red color was very strongly marked. The ro-

tation period of the spot was found to be 9 hours, 55 minutes, 36.5 seconds, much less than anything recorded in recent years.

During the year several observations of the fainter satellites of the planet, particularly of the eighth and most distant, which was discovered by Melotte in 1908, were recorded.

NEW STARS. *Nova Lacertæ*, the discovery of which by the Rev. T. C. Espin, of Walsingham, England, on December 30, 1910, was reported in the YEAR BOOK for 1910, engaged the attention of many observers during 1911. It was found to have been recorded on plates taken at Harvard Observatory fully a month before it was seen by Mr. Espin, its magnitude being then about 5. When first seen, it was a star of the seventh magnitude, and red in color. Its brightness steadily decreased, its magnitude in August being only 10.5; in March its color changed to bluish-white. Examination of plates taken by Wolf and Barnard of the region of the heavens in which the *nova* appeared showed that as far back as 1893, a faint star of the fourteenth magnitude occupied the same position, and it seems reasonably certain that this star took part in the catastrophe which produced the *nova*.

Miss Cannon, examining the Harvard plates, discovered the two stars in the constellation *Sagittarius*, which have been designated *Nova Sagittarii* No. 3 and *Nova Sagittarii* No. 4. The first of these stars appeared on August 10, 1899, its magnitude being 8.5, declining in the course of a few months to 10.5. After October, 1901, when its magnitude was about 13, it could not be found. *Nova Sagittarii* No. 4 was discovered on plates taken between May 22 and July 9, 1901. The date of its appearance could not be determined with accuracy, but it was at its brightest on May 22, its magnitude being 10.3. After some fluctuations in brilliancy, it disappeared. It is worthy of note that the region of the heavens in which these two stars appeared has been the seat of the birth of no less than seven *novæ*.

The discovery of a *nova* in *Pisces* was announced by Herr E. Ernst of Heidelberg.

ABSORBING MATTER IN SPACE. The question of the presence of absorbing matter in interstellar space was discussed by Mr. Innes of the Transvaal Observatory. Certain regions of the sky are apparently black, no stars of any magnitude being visible. Innes suggested that this may be due to the presence of irregular masses of gas, some dark and opaque, others slightly luminous at the edges. The movement of these masses would be sufficient to explain the disappearance and reappearance of certain stars.

Mr. Slipher of the Lowell Observatory at Flagstaff, Ariz., found that certain stars giving the Orion type of spectrum exhibited marked peculiarities in the intensity of the K calcium line. Thus, for several stars of the constellation *Scorpius*, it was found that the spectrum showed a sharp K line while the lines of other elements were broad and diffuse. This calcium absorption is apparently independent of the star, and it was suggested that the absorbing medium in which this takes place consists of matter lying between us and the stars.

COMETS. The periodic comets due to return in 1911 were Brooks's (1889 V), Westphal's (1852 IV), Barnard's (1892 V), Wolf's (1884 III), Encke's (first observed in 1785), and Borrelly's (1905 II). The last three were re-

ported, and were designated 1911a, 1911d and 1911e respectively.

Wolf's comet (1884 III, 1911a) was the first of the comets of the year to be announced. Its period is about 6.8 years, and it returned in 1891 and 1898, but escaped notice at its last return in 1904. It was detected by Professor Max Wolf, its original discoverer, at the Königstuhl Observatory (Heidelberg) on June 20 on a plate taken for that purpose. When discovered, it had a stellar nucleus of magnitude 15, eccentrically placed in a faint globular nebulosity. Only four observations were secured, and it was calculated that at no time during this return would its brightness exceed the fourteenth magnitude. The comet will pass through perihelion on February 11, 1912.

Encke's Comet (1911d). Owing to its faintness and its unfavorable position relative to the sun, it was hardly expected that this famous comet would be discovered at this apparition. It is noteworthy as the first short-period comet to have its periodicity recognized. Since 1819, when this fact was established, the comet has been observed at every reappearance. Another remarkable thing about the comet is the very slow and persistent acceleration which its periodicity is undergoing, a fact which has been held to prove the existence of the luminiferous ether. According to some observers, its brightness varies with the sun-spot activity through the eleven-year period. When first detected by M. Gonnessiat at Algiers on July 31, it was of about the tenth magnitude. It passed through perihelion on August 19.

Borrelly's Comet (1905 II, 1911e), with a period of about 7 years, was rediscovered by Mr. Knox Shaw at the Helwan Observatory, Egypt, on September 19. When first seen, it possessed no distinct nucleus and no tail, and was a body of the thirteenth magnitude. On October 10 it was still very indistinct, but its brightness showed a marked increase, and by the end of November it was of the ninth magnitude and had developed a nucleus and a short tail. Its perihelion passage took place on December 18.

Brooks's comet (1889 V) was due at perihelion on January 8. It was nearest the earth on August 9, 1910, but was not detected.

Barnard's Comet (1892 V) has a period of about 6.37 years, and on this assumption M. Coniel published a search ephemeris, but the year passed without its discovery.

Westphal's Comet (1852 IV). The period of this comet, which passed through perihelion on October 12, 1852, is between sixty and sixty-two years. Three search ephemerides based on periods lying between these limits were published by Herr A. Hnatek, but the rediscovery of the comet was indicated as doubtful owing to the smallness of the calculated magnitudes, which varied from 10.3 to 13.4.

Five new comets were discovered. These were: 1911b, discovered by Kiess at the Lick Observatory on July 9. It passed through perihelion on June 30. It was approaching the earth and in August came within 18,500,000 miles. When first seen, its magnitude was about 8, and it presented the appearance of a globular condensation surrounded by a nebulosity which extended toward the south-southwest; there was, however, no distinct nucleus. It increased rapidly in brightness, developing appendages on both the preceding and follow-

ing sides, and on July 25, when it was of the sixth magnitude, a long streamer extended for some distance in a direction at right angles to the axis and the comet presented a striking appearance in the early morning sky, especially to observers in the southern hemisphere. Many changes in the character and position of its tail were noted. Professor Wolf reported its head as showing a distinct dark space behind its centre and a cone of matter streaming out in front of the coma. About the middle of August it attained its maximum brightness—magnitude 5—and from that time on it decreased rapidly in brilliance, being of magnitude 11.5 only on September 17. It was suggested that this comet was identical with comet 1790 I, but no confirmation of this identification was reported.

1911e, discovered by Brooks at Geneva, N. Y., on July 20. It was then of the tenth magnitude, presenting the appearance of a faint condensation of about half a minute in diameter surrounded by an irregular mass four minutes in diameter. As it was approaching the earth its brightness increased rapidly, and about the beginning of September it became a conspicuous naked-eye object. It was nearest the earth on September 17, being then distant about forty-eight million miles. When it passed through perihelion on October 27 it was of about the third magnitude and, with a tail about twelve degrees in length, presented a brilliant appearance in the morning sky. From this time on, it receded rapidly from both the earth and the sun, its brightness decreased, and passing to the southern hemisphere, the comet became lost to northern observers.

1911f, discovered by M. Quénnisset at Juvisy on September 23, was of about magnitude 7.5, and round in form with a distinct nucleus. Its spectrum was of the hydrocarbon cyanogen type. Its perihelion passage took place on November 12.

1911g, discovered by Beljowsky at the Simeis Observatory on September 28, was a brilliant third-magnitude object with a curved and fan-shaped tail about two or three degrees long. Perihelion passage occurred on October 14.

1911h, discovered by Schaumasse at Nice on November 30 was an object of the twelfth magnitude. It is expected to attain its greatest brilliance about the end of January, 1912, when it should be of the tenth magnitude. It will pass through perihelion on February 5, 1912.

MINOR PLANETS. The number of minor planets announced as new during 1911 was fifty-eight. While this number is slightly in excess of the number reported during 1910, it still falls far short of the totals discovered in each of the preceding four years. Besides, no less than twelve of the finds reported turned out to be identical with previously known asteroids, so that it seems fairly certain that the extraordinary activity in the photographic exploration of the heavens which has characterized the past decade has done much to exhaust the number of minor planets discoverable in that way.

The discoveries of the year were provisionally designated by the letters LE to NN with the omission of MF and NK and the inclusion of LZa. The lion's share, as usual, was announced from the Königstuhl Observatory at Heidelberg by Professor Max Wolf (5) and his assistants Kaiser (17), Helffrich (11), and Massinger (1). Of the remaining twenty-four, ten are to be

credited to Palisa (Vienna), seven to Wood (Johannesburg), four to Metcalf (Winchester, Mass.), two to Beljawsky (Simeis), and one to Lowell (Flagstaff). One of those—LX—credited to Wood was announced by Wolf on May 22, but was afterwards found to be identical with one of a pair first observed by Wood on April 22. It is worthy of note that the discoveries announced by Wood at the Transvaal Observatory at Johannesburg are the first to be made at an observatory south of the equator.

Twelve of the above minor planets were found to be identical with bodies previously known, so that the number of new asteroids not certainly identified with the discoveries of former years was forty-six.

Permanent numbers, ranging from 692 to 714 were assigned to the following minor planets:

1901 HD (=692);
1909 HN (=693), JA (=694, *Ekard*), JB (=695);
1910 JJ (=696, *Leonora*), JO (=1910 JV), JX, KD, KE, KN, KQ, KT (=703, *Noemi*), KU (=704, *Interamnia*), KV, KX, LD, LJ, LK, LM, LN, LO, LS, LW (=714).

In addition to the planets in the foregoing list which have been named, one other received a name in 1911, viz. (689) 1909 HJ = *Zita*.

1911 MT, discovered by Palisa on September 29, proved to be an interesting discovery, inasmuch as it was found to have a rapidly increasing right ascension at opposition, and was therefore in all probability an asteroid of the Eros type. Unfortunately, poor conditions for observation intervened before sufficient data for the determination of its orbit had been secured, and later the planet was found to have disappeared. The few observations obtained were found to fit in well with the hypothesis of a body having about the same perihelion distance as *Eros* and an orbit of somewhat greater eccentricity than the orbit of that remarkable planet.

REFORM OF THE CALENDAR. During the past few years numerous proposals for the reform of the calendar have been put forward. None of them aims at disturbing the present agreement between the calendar and the seasons, which was partly secured by Julius Cæsar and later, in 1582, improved by Pope Gregory XIII., but rather at bringing about a correspondence between the days of the week and those of the year, so that any given day during the year shall always fall on the same day of the week. As the ordinary year breaks up into fifty-two weeks and one day, all of the plans suggested agree in making the odd day a *dies non*, and in giving it a special name; one reformer wishes to call it Zero Day and the extra day of leap year Double Zero, while another would give these two days the names New Year Day and Leap Day, respectively. Each week would begin with Monday. The greatest diversity of opinion arises when it comes to the division of the year into months. One group of reformers demands thirteen months of twenty-eight days each, but here again they differ among themselves as to the best position for the extra month. To place it at the end of the year and call it Trecrement, as suggested by a Chilean, would make the interval between Christmas and New Year too long; hence Slocum would put the extra month in the middle of the year and call it Sol, while Patterson considers Roma a more appropriate name. On the other side stands Professor T. C.

Chamberlin, who proposes to divide the year into four quarters, each consisting of three equal months of twenty-eight days each, named as at present, with an extra week at the end of each quarter. To these extra weeks—the 13th, 26th, 39th, and 52d—he proposes to give the names Easter, Julian, Gregorian, and Christmas week, respectively, and suggests that they might be used for the holding of fairs and festivals, and for the general cleaning-up of the business of the preceding quarter. It has also been suggested that Easter should be made a fixed date and in that way we should get rid of the only remaining vestige of the lunar origin of our calendar.

STANDARD TIME. The anomalous stand of France against the adoption of standard or universal time has at last been abandoned. The French formerly set their clocks by Paris, which was nine minutes and twenty-one seconds fast on Greenwich, and consequently failed to fit in with the scheme of standard time adopted by nearly all civilized countries. At midnight on March 10, 1911, all the clocks in France and her North African possessions were set back by the amount necessary to bring them into agreement with Western European or Greenwich time. Of the countries of Europe, only Ireland, Russia, and Portugal remain aloof from the system, but Portugal announced her intention of adopting standard time for herself and her colonies on January 1, 1912.

The subjoined table gives the central meridian for the countries in the left hand column, and the amount by which the clock is fast or slow on Greenwich. Portugal and the Portuguese colonies are given in italics.

Country	Central Meridian	Fast or slow
Great Britain, France, Belgium, Holland, Spain, <i>Portugal, São Thomé and Príncipe Islands, Whydah</i>		0h.
Sweden, Denmark, Germany, Austria-Hungary, Switzerland, Italy, <i>Servia, Portuguese West Africa</i> ... 15°	E.	1h. fast
Rumania, Bulgaria, Turkey, Egypt, British South Africa, <i>Portuguese East Africa</i> 30°	E.	2h. fast
Mauritius, Seychelles... 60°	E.	4h. fast
Chagos Archipelago.... 75°	E.	5h. fast
India (Bombay, Madras), <i>Portuguese India</i> 82½°	E.	5½h. fast
India (Calcutta)..... 90°	E.	6h. fast
Burma..... 97½°	E.	6½h. fast
Straits Settlements.... 105°	E.	7h. fast
Hongkong, eastern China, Borneo, Philippines, Western Australia, <i>Macao, Portuguese Timor</i> 120°	E.	8h. fast
Japan, Korea..... 135°	E.	9h. fast
South Australia..... 142½°	E.	9½h. fast
Victoria, New South Wales, Queensland, Tasmania..... 150°	E.	10h. fast
New Zealand..... 167½°	E.	11½h. fast

Country	C. M.	F. or S.
Iceland, <i>Madeira, Portuguese Guinea</i>	150°W.	1h. slow
<i>Azores, Cape Verde Islands</i>	130°W.	2h. fast
United States and Canada:		
Intercolonial	60°W.	5h. slow
Eastern	75°W.	5h. slow
Central	90°W.	6h. slow
Mountain	105°W.	7h. slow
Pacific	120°W.	8h. slow

BOOKS. Among the more important works published in 1911 are: Darwin, *Periodic Orbits and Miscellaneous Papers*; Norton, *A Star Atlas and Telescopic Handbook* (Epoch 1920); Abbot, *The Sun*; Stroobant, *Les Progrès Récents de l'Astronomie* (III—année 1909); Newcomb-Engelmann, *Populäre Astronomie*, fourth edition.

ASTROPHYSICS. See ASTRONOMY.

ATHENS, EXCAVATIONS IN. See ARCHAEOLOGY.

ATHLETICS, TRACK AND FIELD. The athletes who stood out most prominently in 1911 were J. P. Jones of Cornell University, R. C. Craig of the University of Michigan and M. J. McGrath and Martin J. Sheridan of the Irish-American A. C. of New York City. Jones established a new amateur record for the mile run, covering the distance in 4 minutes 15 2-5 seconds; Craig ran the hundred yard dash in 9 4-5 seconds; McGrath hurled the sixteen-pound hammer 187 feet four inches, beating the figures he made in 1908 by 14 feet four inches, and Sheridan threw the discus 141 feet 4 3-8 inches.

The senior championship of the Amateur Athletic Union were held at Pittsburgh on June 30 and July 1, the Irish-American A. C. winning with a total of 58 points as against 28 points scored by the New York A. C. Other teams entered and their scores were: Seattle A. C., 12; Olympic Club, 11; Boston A. C., 7; Cleveland A. C., 7; Kansas City A. C., 6; and Chicago A. A., 6. The Irish-American A. C. also was successful in the junior events, rolling up a total of 37 points. The all-round championship was contested for in Chicago on August 12. There were nine entries in the ten events. F. C. Thompson of Princeton University won for the second year in succession with a score of 6709. The record for this event is held by Martin J. Sheridan, who in 1909 made 7385 points.

The thirty-sixth annual track and field meet of the Intercollegiate Association of Amateur Athletes of America was held at Soldiers' Field, Cambridge, Mass., on May 26 and 27. Four new records were made and three others equalled. The new records were established by Jones of Cornell, who ran the half mile in 1:54 4-5 and the mile in 4:15 2-5; by T. S. Berna, also of Cornell, who ran the two miles in 9:25 1-5; and by Horner of Michigan, who put the sixteen-pound shot 46 feet 7 1-8 inches. The largest number of points was scored by Cornell, which had a total of 30 1-2. Yale was second with 24 1-2 and Michigan third with 24. Other colleges scoring points were Pennsylvania, 18 2-3; Dartmouth, 9; Princeton, 8; Harvard, 6; Amherst, 5; Columbia, 5; Massachusetts Institute of Technology, 3 1-3; Williams, 3; Rutgers, 2; Pennsylvania State College, 2; and Brown, 1.

The University of Missouri won the annual

meeting of the Conference Colleges of the West, held at Minneapolis on June 3, scoring 35 points. The totals for the other colleges were: Chicago, 25 2-3; California, 20; Illinois, 19 5-12; Wisconsin, 19 1-2; and Notre Dame, 16.

In the New England Intercollegiate championships held at Springfield on May 20, Williams was the victor with a total of 30 points. Dartmouth finished second with 24 and Massachusetts Institute of Technology third with 18. Other point winners were: Maine, 14; Vermont, 12; Amherst, 11; Bates, 10; Brown, 9; Worcester Polytechnic Institute, 8; Wesleyan, 6; Colby, 5; Trinity, 5; and Holy Cross, 2.

The championships of England were held at Stamford Bridge, London, on July 1, and as in 1910 F. L. Ramsdell of the University of Pennsylvania won the 100-yard and 220-yard dashes. The winners in the other events were: 120-yard hurdles, P. O'Rourke of Phillips College, Cambridge; 440-yard run, F. J. Halbaus, Canada, half mile, H. Braun, Germany; 1 mile, D. F. McNicol, Polytechnic Harriers, England; broad jump, P. Kirwan, Irish American A. C., New York; 4-mile run, H. Kolehmainen, Finland; pole vault and high jump, R. Paseman, Germany; 16-pound shot, J. Barrett, Limerick A. and B. C.; 16-pound hammer, G. E. Putnam, Oxford. The empire championship between England, Australasia, and Canada was won by Canada.

In the Oxford-Cambridge, Yale-Harvard meet the British collegians were the victors by a score of 5 to 4, first places alone counting. The deciding event was the shot put, which was won by G. E. Putnam, an American student at Oxford. The Oxford-Cambridge meet was won by Cambridge. The Olympic games will be held at Stockholm, Sweden, in July, 1912. See CROSS COUNTRY RUNNING.

ATLANTIC CITY. See NEW JERSEY.

ATLANTA. See GEORGIA.

ATOMIC WEIGHTS. See CHEMISTRY.

ATWOOD, H. N. See AERONAUTICS.

AUCKLAND ISLANDS. A dependency of New Zealand (q. v.).

AUDOUX, MARGUERITE. See FRENCH LITERATURE, FICTION.

AUSTIN, ALFRED. See LITERATURE, ENGLISH AND AMERICAN, *Literary Biography*.

AUSTIN DAM. See PENNSYLVANIA.

AUSTRALIA, COMMONWEALTH OF. A British self-governing dependency, consisting of six federated states. The temporary seat of the federal government is Melbourne, Victoria. The permanent capital will be at Yass-Canberra, in the federal district within the state of New South Wales. The government took over the federal district at the beginning of 1911, and during the year much progress was made in carrying out the plans for the new city.

AREA AND POPULATION. The estimated area and the population (exclusive of aborigines), according to the census of March 31, 1900, and final returns of the census of April 3, 1911, are shown below by states:

States	Sq. mi.	Pop. '01	Pop. '11
New South Wales....	310,372	1,354,846	1,648,448
Victoria	87,884	1,201,070	1,315,551
Queensland	670,500	498,129	605,813
South Australia*	903,690	363,157	411,869
Western Australia ..	575,920	184,124	282,114
Tasmania	26,215	172,475	191,211
Commonwealth ...	2,974,581	3,773,801	4,445,005

* Including the Northern Territory.

The Northern Territory (area, 523,620 square miles) was under the jurisdiction of South Australia from 1863 to January 1, 1911, when it was transferred to the Commonwealth. In 1905 the Commonwealth assumed the administration of Papua (q. v.). Its population in 1911 was only 3310. The number of civilized and semi-civilized aborigines returned in the 1911 census was 19,939. Capital cities with population, including suburbs, according to 1911 preliminary census returns: Sydney, N. S. W., 637,102; Melbourne, Victoria, 591,830; Adelaide, S. A., 192,194; Brisbane, Qld., 141,342; Perth, W. A., 84,580; Hobart, Tas., 38,055;—other cities: Newcastle, N. S. W., 65,500; Ballarat, Vict., 44,000; Bendigo (Sandhurst), Vict., 42,000; Broken Hill, N. S. W., 31,000; Geelong, Vict., 28,880; Launceston, Tas., 24,536. Movement of population in 1910, for the Commonwealth: Births, 116,894; deaths, 45,634; marriages, 36,581; oversea arrivals, 95,692; departures, 58,145.

EDUCATION. Public instruction is under the control of the separate states. Primary instruction is free and compulsory. The following figures relate to 1909:

	N. S. W.	Vict.	Qld.	S. Aust.
State schools	3,075	2,035	1,141	722
“ teachers	5,431	4,868	2,521	1,294

Enrollment	8,506	6,513	164,428
Av. attendance	7,209	5,210	127,069

There is a number of superior and technical schools. For 1909, the four universities, Sydney, Melbourne, Adelaide, and Tasmania (at Hobart), reported 236 teachers and 3041 students.

MINERALS. The following table shows the value of the most important minerals, and the total for all minerals, produced in 1909, and the grand total of production from the beginning of mining in Australia up to the end of that year:

	N. S. W.	Vict.	Qld.	S. Aust.
Gold	£ 869,546	£2,778,956	£1,935,178	£ 54,354
Coal	2,618,596	76,945	270,726
Copper	424,737	44	853,196	342,329
Silver	416
lead*	1,484,641
Zinc	1,041,280
Tin	211,029	7,067	244,927	32,741
All minerals	7,406,940	2,900,624	3,655,198	478,126
Grand total	198,290,805	288,368,506	92,358,833	31,657,599

	W. Aust.	Tas.	Cwllth.
Gold	£ 6,776,274	£ 190,201	£ 12,604,509
Coal	90,965	26,464	3,083,696
Copper	104,644	608,038	2,332,988
Sil.-lead*	1,199	298,880	1,785,136
Zinc	244	1,041,524
Tin	65,969	418,165	979,888
All minerals	7,059,052	1,545,222	23,045,162
Gr. total	94,941,159	32,368,587	737,985,489

* Silver-lead bullion and silver-lead ore, but not fine silver or lead pig.

Commonwealth production to end of 1909: Gold, £514,091,517; silver and lead, £60,324,687; copper, £54,196,026; tin, £27,728,900; Coal, £66,537,972; other, £15,196,387; total, £737,985,489. Gold production reached its maximum in 1903, when the output in Western Australia was valued at £8,770,719 and in the Commonwealth £16,294,684. Gold production to the end of 1909 (beginning with 1851 in New South Wales and Victoria): N. S. W., £57,189,282; Vict., £285,100,389; Qld. (from 1860), £70,224,573; S. Aust. (from 1856), £2,840,206; W. Aust. (from 1886), £91,780,563; Tas. (from 1867), £6,956,504; Com'wealth, £514,091,517.

AGRICULTURE. The acreage under crop (exclusive of grasses) and under artificially sown grasses respectively was as follows in the year 1909-10: N. S. W., 3,180,561 and 888,937; Vict., 8,658,535 and 988,671; Qld., 606,790 and 108,438; S. Aust., 2,530,301 and 23,343; W. Aust., 722,086 and 9017; Tas., 274,026 and 439,450; Commonwealth, 10,972,299 and 2,457,856;—Commonwealth in 1908-9, 9,891,243 and 2,445,403; in 1901-2, 2,278,370 and 1,007,115. The following table shows area and production of chief cereal crops in 1909-10:

	Wheat		Oats	
	Acres	Bu.	Acres	Bu.
N. S. W...	1,990,180	28,582,029	81,452	1,966,586

Cmlth.	143,013	2,436,384	364,585	10,770,648

Total value of foregoing crops: Wheat, £18,048,770; oats, £1,727,489; barley, £445,201; corn, £1,621,996. Commonwealth figures for other crops, 1909-10: Potatoes, 137,070 acres, yielding 387,036 tons, valued at £1,637,388; hay, 2,228,029 acres, 3,153,196 tons, £9,530,092; green forage, 308,082 acres; vineyards, 58,151 acres, 4,602,577 gals. of wine, 15,314 tons grapes, and 3,114,496 lbs. raisins. The acreage under sugar cane in 1909-10 was 142,261, of which 86,575 were productive, yielding 1,294,575 tons (of which Queensland 128,178 and 80,095 acres and 1,163,494 tons). Sugar output in 1909-10, 147,470 tons, against 205,576 in 1906-7 (Queensland 132,816 and 182,158).

	Horses	Cattle	Sheep	Swine
N. S. W.	604,784	3,027,727	46,202,578	237,849

1908	1,927,731	10,547,679	87,043,266	695,689
1905	1,673,805	8,525,025	74,403,704	1,014,853

* Including 414,080 in Northern Territory.

Butter output in 1908 and 1909, 145,317,357 and 154,273,252 lbs., cheese, 14,759,788 and 15,774,837. Sheep and lambs slaughtered in the Commonwealth (some of the figures making up these totals are estimates): 1901, 8,972,169; 1905, 8,958,363; 1908, 11,193,357; 1909, 13,346,856. Exports of mutton and lamb preserved by cold process: 1905, 86,858,344 lbs.; 1908, 91,607,614; 1909, 116,915,639; total for five years ended 1909, 495,301,739 lbs., of which 411,176,214 lbs., worth £5,093,090, to the United Kingdom. The 1909 wool output was worth about £28,000,000. Estimated wool production, stated as in the grease, in thousands of pounds:

	1905	1906	1907	1908	1909
N. S. W.	302,494	332,381	375,224	344,551	379,388
Vict.	74,747	78,258	120,018	93,999	112,102

The mileage of government lines open to traffic increased from 12,578 in 1901 to 13,726 in 1905 and 15,467 in 1910. Mileage (government) under construction, June 30, 1910, 1047; authorized, but not begun, 1140. Cost of construction and equipment of government lines to June 30, 1910, £146,882,474. Gross revenue for year ended on that date, £10,042,000; working expenses, £9,899,000; percentage of working expenses to gross earnings, 61.70, as compared with 59.84 in 1909, 62.65 in 1905, and 64.76 in 1901. Telegraph, exclusive of railway telegraphs, in 1909: lines, 42,298 miles; wire, 89,468; offices, 3507. Post offices in 1909, 5387, as compared with 4994 in 1901 and 4463 in 1891; in 1909 post offices plus receiving offices numbered 7698.

RAILWAYS. The various railway systems of New South Wales showed marked progress during the year, and the North Coast Railway had under construction 190 miles of main line; 103 miles of branches were under construction, and six branches aggregating 115 miles were opened. There had been authorized the construction of 243 miles. The state of Victoria had five lines with a mileage of 211 miles under construction, and three lines aggregating 86 miles authorized. In South Australia four lines amounting to 290 miles were being built and 23 miles had been opened. In western Australia eight lines with 234 miles of track had been opened, and there were under construction, on June 30, nine lines of 354 miles, of which two lines comprising 71 miles were opened subsequent to that date, and six lines with a total of 507 miles were authorized for construction. In Queensland the report was 207 miles opened and a large mileage in hand. During the year the question of the gauge of the Transcontinental Railway from Port Augusta to Kalgoorlie which had been authorized by the

Commonwealth parliament was settled at a standard gauge of 4 ft. 8½ in.

FINANCE. Commonwealth revenue and expenditure for fiscal years ended June 30: 1906, £11,881,924 and £4,497,542; 1909, £14,350,793 and £6,420,398; 1910, £15,540,699 and £7,499,510. Surplus is paid over to the states. Of the 1910 revenue, £9,505,855 was derived from customs, £2,087,310 from excise, and £3,731,741 from posts; of the expenditure, £3,201,554 for posts and £1,148,484 for defense. There is no federal debt.

Statistics for state finance for fiscal year ended June 30, 1910:

	Revenue	Expend.	Debt
N. S. W.	£14,540,073	£13,038,150	£ 92,525,095
Vict.	8,597,992	8,579,980	55,576,725
Qld.	5,119,254	5,113,578	44,276,067

Total	36,956,812	35,373,254	1257,623,663
1909	34,457,640	33,983,842	251,773,533
1902	28,197,927	29,231,385	214,255,209

* Including Northern Territory debt, £2,662,678.
† Against which, sinking fund £4,777,006.

The state debts have been incurred largely for railways and other public works.

ARMY. The operation of the Australian Defense acts of 1909 and 1910, with the object of securing compulsory service, came into effect in June, 1911, in so far as it concerned senior cadet training of males from fourteen to eighteen years of age. Over 150,000 young men were enrolled, and in September 87,389 youths were actually under training, drill centres being established in some 500 different localities, and the provision of suitable armories for such training being an important consideration. The plan of defense provided for compulsory service in three classes: First, junior cadets, 12 to 14 years; second, senior cadets, 14 to 18, and third, a national guard, with service up to 26 years of age. Lord Kitchener's report, under which the military organization of the Commonwealth was being undertaken, recommended an army of 80,000 on a peace basis, divided into a garrison of 40,000, and a mobile force of 40,000; the organization to embrace 84 battalions of infantry, 28 regiments of light cavalry, 224 guns, fourteen engineer companies, and departmental troops. This force was to be formed from those who had undergone the cadet training mentioned above, and on a war basis, the senior cadets, and those of twenty-five and twenty-six years of age who have had military training would be called out to increase the force to 107,000. The plan provided for six days' training every year for men between the ages of twenty and twenty-five, and a division of the Commonwealth into 215 military areas each under a permanent officer of instruction. Ten of these areas would be united to form a group under a superior officer. The plan of organization further provided that every two town, or three country, areas should form an infantry battalion. The army scheme was to be carried out under officers who thoroughly understood the proposed system and needs. Seven years was estimated to involve a total cost of some \$9,000,000. It carried with it the gradual abolition of the volunteer militia.

To secure the necessary officers for such an establishment a royal military college was opened in July, 1911, at Dunbroon, and a small arms factory was being organized at Lithgow. The organization of the army was under the general control of a chief of the general staff, and of the Commonwealth section of the Imperial General Staff, created in August, 1909, Maj.-Gen. Sir J. C. Hoad, K. C. M. G., who is also director of defense organization, military training, and intelligence.

In contrast with the proposed plan in course of development, the military system existing in 1911 involved an elastic framework capable of expansion. The garrison force for both peace and war amounted to 12,000, while a field force was maintained on a peace basis half of the war strength. The peace establishment consisted of 6500 light horse with twenty-four guns, and 7500 infantry with thirty-six guns, making a total of 14,000 and sixty guns, which in time of war would be increased to 28,000, all ranks, with eighty-four guns. Including the garrison troops there would a total of 28,000 men on a peace basis, and 40,000 for the war strength of the Commonwealth, to which might be added some 7000 light horse provision train, 9103 cadets, and 28,721 rifle-club members, making a grand total of all available forces 2400 officers and 60,000 of other ranks.

NAVY. In 1911 the Commonwealth government adopted a plan of naval construction covering a period of twenty-two years and providing for a fleet of 8 dreadnought cruisers, 10 protected cruisers, 18 destroyers, 12 submarines, and 3 depot ships for flotillas, and 1 fleet repair ship, the total cost to be £23,000,000. This sum, however, does not include initial and annual charges for naval works, such as docks, etc. It was officially stated that the primary object of the navy is to support the empire's command of the sea, and the secondary object to protect Australian ports and shipping from hostile raids. September, 1912, was fixed as the date of completion of the ships of the first fleet unit: the *Australia*, an armored cruiser of the *Indomitable* type (launched at Clydebank, October 25, 1911); 3 second-class protected cruisers; 6 destroyers (of which three are completed); and 2 submarines (one not to be completed till 1913). Before these ships were begun the navy consisted of 12 vessels; 1 armor-plated turret ship (the *Cerberus*, 3480 tons), one steel cruiser the *Protector*, 920 tons), 2 steel gun vessels, 2 first-class torpedo boats, 4 second-class torpedo boats, and 2 torpedo launches.

GOVERNMENT. The executive authority is vested in a governor-general, appointed by the crown and assisted by a responsible ministry. The legislative power devolves upon a parliament of two houses, the Senate (thirty-six members, six from each state), and the House of Representatives (seventy-five, in proportion to state population). Members of both houses are elected by universal adult suffrage. There are separate state parliaments, which are elective; but the state governors are appointed by the crown. The Earl of Dudley, who became governor-general in 1908, was succeeded in July, 1911, by Baron Denman.

Ministry in 1911 (constituted April 29, 1910): Prime Minister and Treasurer, Andrew Fisher; Attorney-General, William Morris Hughes; External Affairs, Josiah Thomas (1911); Home

Affairs, King O'Malley; Postmaster-General, C. E. Frazer (1911); Defense, George Foster Pearce; Trade and Customs, Frank Gwynne Tudor; without portfolio, Senator G. McGregor, Senator Edward Findley, and H. A. Roberts (1911).

HISTORY

GENERAL POLITICAL SITUATION. The Deakin ministry, which had lasted from July, 1905, to November, 1908, was succeeded by a Labor ministry under Mr. Fisher as premier, but on the reopening of Parliament on May 26, 1909, this ministry was, in turn, defeated by a union of the opposition groups. A new coalition ministry was formed at that time under Mr. Deakin, but in the general elections of April 13, 1910, the Labor party obtained a majority of 10 in the Senate and 13 in the House, and on April 20, Mr. Fisher again formed a Labor ministry. By January 1, 1911, the Commonwealth had completed the first ten years of its history. Some of its notable achievements at that time were: First, the formal acquisition of its own capital site and territory. Second, the financial independence of the federal government through the expiration of the Braddon clause of the constitution, according to which the states were to receive during the first ten years of the Commonwealth at least three-fourths of the Commonwealth's customs and excise revenues. A new arrangement was made in 1910 whereby the states were to receive for the next ten years twenty-five shillings per head of the population as their share of the Commonwealth revenues. Third, the control of the Northern Territory by the Commonwealth. Fourth, the adoption of a comprehensive scheme of defense, involving the principle of compulsory training. At the beginning of 1911 the Labor party was in control, not only in the Commonwealth government, but throughout most of the states. The leading political issue was raised by its attempt to carry into effect its policy of extending the powers of the federal government.

THE REFERENDA. In November, 1910, the Commonwealth Parliament passed the two constitutional amendment bills. These embodied several important amendments to the constitution, providing for a great extension of the lawmaking power of the federal government over industry and commerce, giving the federal government control over all corporations operating in the Commonwealth, and the right to legislate upon trade, commerce, and industries, including questions of wages, employment, and trade disputes, and to exercise its authority over monopolies and combinations, and providing for national acquisition and control of any business which should have been declared by resolution of each house of Parliament to be a monopoly. The constitution requires that any amendment to it shall first be passed by Parliament and then submitted to the people in a referendum. Accordingly on April 26, 1911, the amendments dealing with the legislative powers were embodied in one referendum and that dealing with the nationalization of monopolies in another, and the two referenda were submitted to popular vote. At first leaders on both sides urged the public not to regard the amendments as party measures, but to decide upon them on their merits. As the campaign went on, however, the party lines became distinct and the contest grew exceedingly bitter. The Liberal

opposition accused the Labor government of an attempt to despoil the states of their rights and of rushing down the path towards socialism. On behalf of the ministry, it was urged that as matters stood the federal government was powerless to make laws embodying the will of the people as expressed in the last election, and that without these amendments Parliament could not exercise the power with which the constitution had endowed it. To this the opposition replied that while some changes were necessary, no such drastic means, however, were required for enabling Parliament to exercise its proper functions. On the one side the cry was, a national Australia; and on the other, it was state rights. The result of the vote was a complete defeat for the government. The referenda were rejected by a majority of nearly a quarter of a million out of a vote of 1,200,000. The actual vote was as follows: On the referendum as to the extension of the legislative powers of the government to commerce and industries, those in favor were 462,412, and those opposed, 714,770; and on the referendum empowering the government to nationalize monopolies, those in favor were 464,703, and those opposed, 707,017. The campaign led to a serious split in the ranks of the Labor party in New South Wales, where a great number voted against the amendments. (See *NEW SOUTH WALES, History*.) The Liberal opposition hailed the results as evidence of the people's common sense and the general disapproval of the government's socializing tendency. The government's friends, on the other hand, attributed their defeat to the general ignorance of the real meaning of their proposals and to the use of money on the part of the opposition in the course of the campaign.

NAVAL PROGRESS. The first ship of war ever built in Australia, the *Warrego*, was launched at Sydney on April 4, 1911. Two foreign built destroyers, the *Yarra* and the *Parramatta*, had already arrived in Australian waters, and these three vessels were hailed with popular enthusiasm as marking a definite stage toward the creation of the first naval unit. This first unit which was to be completed by September, 1912, was to comprise one armored cruiser, three protected cruisers, six destroyers, and three submarines. The armored cruiser, the *Australia*, was launched in October, 1911. It was at first arranged that the imperial government should pay a share of the cost of maintenance, but at the express request of the Commonwealth government, Australia assumed the entire burden. Questions as to methods of establishing and maintaining the fleet had been under discussion for several years. Finally the government requested a naval expert, Admiral Henderson, to report on this subject. His report as to the size and nature of a fleet which should be suitable for defense, and proportionate to the population of the country, was published in March, 1911, and the government based on it its naval programme (see above, *Navy*). Early in the year a naval board was appointed, with the minister of defense as president and the director of the Commonwealth Naval Affairs as senior member.

OTHER EVENTS. The appointment of Lord Denman to succeed the Earl of Dudley as governor-general was announced in March. The treatment of the natives of northwestern Australia was called in question early in the year, and the government was asked concerning its

policy in dealing with certain alleged abuses. The programme then outlined included the appointment of medical officers and of an official to look after the interests of the natives; and also a reserve force for the maintenance of order. The Australian railways, of which the per capita mileage is the longest in the world, had the disadvantage of being of different gauges, each state having begun its own system and adopted a gauge without reference to the subsequent necessity of linking up with another line. Thus the traveler from Brisbane to Melbourne is obliged to change trains on the New South Wales border and again on the Victoria border. Apart from this inconvenience, military considerations drew attention to the grave need of a uniform gauge in time of war and at a meeting of the railway commissioners such uniformity was recommended, the preference being the gauge of the New South Wales line, 4' 8½". The cost of making this improvement was to be divided between the Commonwealth and the states. This gauge had already been adopted by the new line projected between Western Australia and the eastern states. Other important events in the Australian development were the adoption of penny postage, which went into force on May 1, and the establishment of a new university at Brisbane. The government, as a part of its legislative programme, early in July presented a very extensive railway project, namely, the completing of the East and West Transcontinental Railway. Other features of the programme as announced in that month were a Commonwealth Banking bill, and bills unifying the Australian Bankruptcy law and amending the Arbitration and Electoral acts. It was also announced that the Navigation bill, which failed of passage in the preceding year, would be resubmitted. On the opening of Parliament on September 5, Lord Denman outlined the government programme, of which the principal features were: The amendment of the Conciliation and Arbitration act, the establishment of a Commonwealth bank, and the building of the transcontinental railway. Other matters that were to receive the serious consideration of the government were: Life, fire, sickness, and unemployment insurance, and the consideration of the state debts.

For reference to labor arbitration in Australia, see **ARBITRATION AND CONCILIATION, INDUSTRIAL**.

AUSTRALIAN ANTARCTIC EXPEDITION. See **POLAR RESEARCH**.

AUSTRIA. See **BATTLESHIPS**.

AUSTRIA-HUNGARY. A constitutional monarchy of central Europe, consisting of the Austrian empire and the Hungarian kingdom, united under one sovereign, besides the common territory of Bosnia and Herzegovina (annexed October 5, 1908). The capital of Austria is Vienna, and of Hungary, Budapest.

AREA AND POPULATION. The area of Austria is stated at 300,193 square kilometers (115,905 square miles); Hungary, 324,857 square kilometers (125,427 square miles); Bosnia and Herzegovina, 51,199 square kilometers (19,767 square miles); total, 676,249 square kilometers (261,100 square miles). The following table shows in detail the area and the population according to the censuses of December 31, 1900 and 1910 (the last column showing population per square kilometer at the end of 1910):

	Sq. kil.	Pop. 1900	Pop. 1910	
Lower Austria.	19,854	3,100,493	3,530,698	178

* Of whom 22,944 military. † Of whom 32,758 military.

Emigration has been as follows: 1907, 386,528 from the monarchy (of whom 177,354 from Austria); 1908, 101,275, (56,214); 1909, 272,266 (143,532); 1910, 278,840 (148,638). Population of the larger cities, according to the census of December 31, 1900, and provisional returns of the census of December 31, 1910: In Austria, Vienna, 1,711,556 and 2,030,850; Trieste, 134,143 and 229,475; Prague, 201,589 and 224,721; Lemberg, 159,877 and 206,574; Gratz, 138,080 and 151,668; Cracow, 91,323 and 151,318; Brunn, 109,346 and 125,008; Czernowitz, 67,622 and 86,870; Pilsen, 68,079 and 81,165; in Hungary: Budapest, 732,322 and 881,601; Szegedin, 102,991 and 118,147; Szabadka (Maria-Theresiopel), 83,593 and 94,952; Debreczen, 75,006 and 92,088; Zagráb (Agram), 61,002 and 78,850; Pozsony (Pressburg), 65,867 and 77,953.

EDUCATION. Elementary instruction is free and compulsory throughout the monarchy. In Austria there were at the end of 1908 22,985 elementary schools, including 1174 private (against 22,614 and 1166 the year before), with 102,937 teachers and 4,377,913 pupils; children of school age, 4,618,097; training colleges, 131. In 1910 gymnasias numbered 278 (95,867 students); realschulen, 144 (47,519.) There are various technical, professional, and special schools, with a large number of students. The state maintains eight universities, which in 1910-11 were reported to have 1631 teachers and 28,662 students (Vienna: 539 and 9736, German;—Prague: 165 and 1844, German; 249 and 4432, Bohemian;—Cracow: 188 and 3308, Polish;—Lemberg, 178 and 4824, Polish.) The eight government technical high schools had in 1910-11 784 teachers and 11,828 students.

In Hungary, there were in 1909 2745 infant schools, with 238,129 infants. In 1908-09 elementary schools numbered 19,175, with 44,280 teachers and 2,868,889 pupils; children of school age, 3,145,006; training colleges, 95, with 1170 teachers and 10,457 students; gymnasias, 187, with 3701 and 60,518; realschulen, 43, with 98

and 13,213. As in Austria, there are many technical and special schools. In 1909 the technical high school in Budapest had 155 teachers and 1349 students. The state maintains three universities: Budapest, with 351 teachers and 6491 students in 1909; Klausenburg, with 136 and 2078; and Agram, with 87 and 1055.

AGRICULTURE. The area in thousands of hectares (ha.=2.471 acres) planted to the principal crops in 1909, and their production in thousands of metric quintals (qu.=220.46 pounds) are reported as follows:

Crops	Austria		Hungary	
	1000 ha.	1000 qu.	1000 ha.	1000 qu.
Rye	2,078	29,068	1,076	12,002

Vines	230	6,253*	341	4,364*

* Thousands of hectoliters of wine.

The following table shows the area harvested and the production of principal cereals in 1910, in thousands of hectares and thousands of metric quintals:

Crops	Austria		Hungary	
	1000 ha.	1000 qu.	1000 ha.	1000 qu.
Rye	2,061	27,672	1,214	13,879
Oats	1,833	20,632	1,166	10,845
Barley	1,102	14,722	1,163	12,227
Wheat	1,214	15,673	3,794	49,368
Corn	312	4,417	2,830	54,229

MINING. In Austria, the total value of mining products (exclusive of salt, petroleum, etc.) was 317,833,337 kronen in 1908 and 317,501,821 in 1909; furnace products, 136,920,722 and 137,235,740 respectively. The most important metal is iron, the ore produced in 1909 amounting to 2,490,277 metric tons, valued at 22,729,690 kronen; pig iron, 1,465,051 tons, 117,083,065 kronen. Coal produced in 1909, 13,713,043 metric tons, 141,342,818 kronen; lignite, 26,043,716 tons, 138,684,501 kronen; salt, 359,801 tons, 46,740,565 kronen. The values of the principal raw metals and of coal produced are reported as follows, in thousands of kronen:

	1900	1905	1908	1909
Pig iron....	82,304	83,227	117,159	117,084
Zinc	3,164	5,283	5,916	5,942
Lead	4,722	4,810	4,716	4,676
Silver	3,908	3,754	3,414	3,256
Mercury ...	2,495	2,551	3,035	3,170
Copper	1,538	1,508	1,060	1,442
Lignite	112,635	100,957	140,150	138,685
Coal	95,591	99,875	139,716	141,343

Persons employed, in Austria, in 1908 and 1909, respectively: In mining (exclusive of petroleum and salt works, etc.), 148,634 and 149,955; in smelting, 9446 and 8949; in salt

works, 7052 and 5654 (exclusive of sea-salt works).

In the kingdom of Hungary the values of the principal mineral and smelting products are reported to have been as follows, in thousands of kronen:

	1905	1907	1908	1909
Lignite	39,121	51,887	62,540	68,842
Pig iron	33,723	36,329	43,557	42,730
Coal	11,345	14,721	16,116	17,965
Iron ore	8,259	11,439	13,287	14,526
Gold	12,017	11,479	10,787	8,933
Silver	1,618	1,266	1,132	940

Persons employed, in Hungary in 1908 and 1909, respectively, in mining and smelting, 81,053 and 84,568; and in salt works, 2532 and 2530.

MANUFACTURES. Manufacturing industries are of much greater importance in Austria than in Hungary, which is more distinctively agricultural. The latest comprehensive statistics of Austrian manufactures are for the year 1902, when productive industries numbered 652,424 (629,809 principal and 22,615 subsidiary), with 2,869,457 employees and 1,558,582 horsepower; trade and transport, 399,412 industries (370,302 principal and 29,110 subsidiary), with 716,299 employees and 229,285 horsepower; in home industries, 463,564 workers; persons dependent on all these industries, over 7,000,000. For Hungary, the latest comprehensive figures are for the year 1900, when the workers in the various industries (including trade, etc.) numbered 1,127,730, and the total number dependent thereon, over 2,600,000.

COMMERCE. The following table shows, in thousands of kronen, the special trade in merchandise of the common customs territory of the monarchy (imports for consumption and exports of domestic produce) and the imports and exports of coin and bullion:

	1907	1908	1909	1910
Imps.				
Mds. ...	2,501,974	2,398,094	2,746,331	2,852,852
C. & B..	43,786	83,515	237,101	43,101
Total ...	2,545,760	2,481,609	2,983,432	2,895,953
Exps.				
Mds. ...	2,457,286	2,255,268	2,318,868	2,418,606
C. & B..	78,866	66,535	128,331	80,930
Total ...	2,536,152	2,321,803	2,447,199	2,499,536

Values, in thousands of kronen, of the more important classes of imports and exports in the special trade are shown in the table below. The letters at the left indicate: *a* cotton and its manufactures; *b* wool and its manufactures; *c* cereals, flour, etc.; *d* coal and other fuel; *e* vegetables, fruits, etc.; *f* animal products; *g* iron and steel and their manufactures; *h* other common metals and their manufactures; *i* machines, apparatus, etc.; *k* vehicles and vessels; *l* instruments, watches, etc.; *m* silk and silk goods; *n* flax, hemp, jute, etc., and their manufactures; *o* colonial produce; *p* leather and its manufactures; *q* chemicals, by-products, etc.; *r* minerals; *s* tobacco; *t* rubber and its manufactures; *u* sugar; *v* cattle and draft animals; *w* apparel, etc.; *x* wood and bone manufactures; *y* glass and glassware; *z* paper and its manufactures; *zz* southern fruits.

A.-H., '08....	142,670	16,498,481	141,718	16,277,480

Merchant marine at the beginning of 1910: 473 steamers of 456,216 tons, and 15,007 sailing vessels of 46,747 tons.

COMMUNICATIONS. Railways 1911 15,943 kilometers (28,547 miles), of which 22,925 kilometers (14,245 miles) were in Austria, 21,062 kilometers (13,087 miles) in Hungary, and 1956 kilometers (1215 miles) in Bosnia and Herzegovina. Of the Austrian lines, about seven-tenths, and of the Hungarian about four-fifths, are owned or operated by the state. Austria has about 4200 miles of navigable river and canal, Hungary, about 3200 miles, 2450 for steamers. Post offices (1909): Austria, 9287; Hungary, 5986; Bosnia and Herzegovina (in 1910), 154; foreign, 36. Telegraph (1909): 6839 offices, with 45,489 kilometers of line and 230,801 of wire; Hungary, 4435 offices, with 25,031 and 142,901; Bosnia and Herzegovina, 173 offices, with 4102 and 12,778.

FINANCE. The cost of administering the common affairs of the monarchy is borne by both governments in a proportion agreed to by their

parliaments and sanctioned by the sovereign. The agreement renewed for ten years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and the remaining expenditure be satisfied by Austria in the proportion of 63.6 per cent., and by Hungary, 36.4 per cent. The standard of value is gold, and the monetary unit the krone (crown), worth 20.3 cents. In 1906 the expenditure of the monarchy amounted to 419,594,656 kronen (339,805,573 ordinary and 79,989,083 extraordinary); in 1907, 433,529,713 kronen (365,582,523 ordinary and 67,947,190 extraordinary); in 1909, 514,376,180 kronen (394,372,164 ordinary and 120,004,016 extraordinary). These amounts were balanced by the receipts, as follows:

Revenue	1906	1907	1909
Net customs ...	154,577,783	162,032,206	169,931,455
Hungarian treasury	5,310,337	5,429,950	6,888,895
Matricular contributions	259,706,536	266,067,557	337,555,830
Total	419,594,656	433,529,713	514,376,180

According to the budget for 1911, estimated revenue and expenditure balanced at 457,903,864 kronen. Estimated expenditure for the army, 367,566,499; navy, 68,657,210.

No loans are contracted jointly by Austria and Hungary. When the union was effected in 1867, existing obligations were assumed proportionally; this debt on January 1, 1911, amounted to 5,199,884,244 kronen.

In Austria, revenue and expenditure have been, in thousands of kronen:

	1907	1908	1909
Revenue	2,253,052	2,388,384	2,888,556
Expenditure	2,209,093	2,373,894	2,788,435

The budget estimates for revenue and for expenditure for 1908 were 2,149,022,233 and 2,148,913,254 kronen, respectively; for 1909, 2,482,062,182 and 2,404,647,482; for 1910, 2,727,741,383 and 2,780,822,657 (2,477,876,201 ordinary and 302,946,456 extraordinary). The larger items of estimated revenue for 1910 were: Railways, 776,176,990 kronen; excise, 371,384,000; direct taxes, 348,939,200; tobacco monopoly, 272,147,000; posts and telegraphs, 170,880,000. The larger estimated expenditures (ordinary and extraordinary): Railways, 735,561,850 kronen; finance, 818,327,143 (including 478,384,244 for public debt); common expense of the monarchy, 350,184,890; posts and telegraphs, 169,503,180; worship and public instruction, 103,001,572; public works, 100,458,323; justice, 86,387,991; national defense, 98,701,330. On January 1, 1911, the consolidated debt was 6,613,800,038 kronen; floating debt, 297,765,671; total, 6,911,565,709.

In Hungary, the revenue in 1908 and 1909 was 1,531,368,000 and 1,750,782,500 kronen, respectively (ordinary, 1,409,321,000 and 1,452,128,717); expenditure, 1,616,245,000 and 1,721,563,951 (ordinary, 1,319,539,000 and 1,392,557,391; sinking fund, 200,390,000, 199,916,227). For 1910 the total estimated revenue was 1,555,777,976 kronen (including 161,992,281 extraordinary) and the total estimated expenditure 1,555,729,907 kronen (including sinking fund, 163,063,554); for 1911, revenue, 1,672,-

507,129 (135,337,196 extraordinary) and expenditure, 1,672,457,302 (sinking fund, 138,727,981). Larger items of estimated ordinary revenue for 1911: Railways, 372,000,000 kronen; direct taxes, 278,770,000; excise, 249,540,000; tobacco monopoly, 164,987,000. Larger estimated expenditures: Ministry of commerce, 399,750,270 kronen; ministry of finance, 241,054,170; Hungarian debt, 212,076,759; ministry of the interior, 91,881,451; part in the common expense of the monarchy, 89,590,791; ministry of worship and public instruction, 86,168,293; ministry of agriculture, 68,160,242; debt of the monarchy, 60,619,340; ministry of national defense, 57,617,366. Debt in 1909 (not including Hungary's part in the common debt), 5,075,376,498 kronen; in addition, arrears, etc., 957,516,686; total, 6,032,893,184.

ARMY. The dual monarchy supports an active army with a single organization, according to the compromise of 1867. It is organized on the German basis, and in 1911 consisted of seventeen army corps. Each corps, with the exception of the second, consists ordinarily of two infantry divisions, two brigades to a division, one brigade of cavalry, one brigade of field artillery, and one section of train. The second corps, however, consists of three divisions of infantry, while other corps contain mountain troops and varying amounts of cavalry. A reorganization of the army was proposed in 1911 which involved the addition of a period of two years' service, except in the case of the cavalry and the horse artillery, and an increase in the annual contingent of recruits.

The annual contingent in 1911 for the common army of the kingdom, including the navy, was 103,100, of whom Austria was to furnish 59,024, and Hungary 44,076, while the Landwehr in Austria was to receive 19,240 and the Honved in Hungary 12,500. The plan proposed was to increase this annual contingent from 103,100 to 259,500, of whom 91,313 were to be apportioned to Austria and 68,187 were to come from Hungary. Of this contingent 134,500 would serve for two years, 19,000 for three years, and 6000 would serve four years in the navy. At the same time, the contingent of the Austrian Landwehr was to be increased, and the Honved, or Hungarian second line, was to be strengthened, and a reorganization on the lines of the active army was to take place.

In 1911 five cavalry divisions and thirty-four infantry divisions made up the seventeen corps of the active army, with a Landwehr division attached to each regular division. On a peace basis the active army comprised 106 regiments of the line, four regiments of Tyrolese rifles, and twenty-six battalions of regular rifles, making a total of 468 battalions. The cavalry consisted of fifteen regiments of dragoons, eleven of Uhlans and sixteen of hussars, making a total of 252 squadrons. The artillery had been recently reorganized so that each army corps had with it 130 field guns, twenty-four howitzers, and twenty-four guns for the Landwehr division. There were five siege howitzer divisions in the heavy artillery, each with forty-four gun batteries when organized on a war basis, twelve batteries of mountain artillery, and six regiments of fortress artillery. The total strength of the former was given as follows: On a peace basis field army 319,500; Landwehr and Honved 67,200, or a total of 386,700 men. On a war basis this would be increased as follows: Field

army 900,000, Landwehr and Honved 160,000, second reserve 500,000, Landstrum 2,000,000, or a total of 3,500,000.

The plans adopted in 1911 were intended to establish conditions by which the war footing could be more readily realized, as it was estimated that under the conditions then existing the war effective amounted to about 1,800,000 officers and men. The Honved, or national Hungarian army, in times of peace is under Hungarian jurisdiction exclusively, but in times of war is subject to the commander-in-chief.

The affairs of the army and the plans for reorganization were somewhat disturbed during the year by the crisis in the War Office, whereby the war minister, General Baron von Schönaich, retired in September, was succeeded by General von Auffenberg as minister of war. There was continued discussion of the reorganization of the army and military legislation during the year (see *History*), and in December, 1911, a meeting of the Delegations was held at Vienna, and there was voted after a short session a provisional budget for four months, which was based on the credits that had been allowed in the budget of 1911. It was impossible to vote a definite budget on account of the lack of certainty as to the time when a new military law would be passed, as such a law doubtless would increase the military expenses. General von Auffenberg made a speech to the assembly which was marked by unusual frankness, and described the inadequate strength and condition of the Austrian army, which he said had fallen to a point relatively far below that of other European powers. He stated that the maintenance of the national position depended on the proper increase of the army, and said that they were unable to fill the present skeleton organization by more than 30,000 men, and that the effective strength of the infantry companies, ninety-three men, which was less than that of other armies, was not attained on the recent manoeuvres by 50 per cent., while the fourth battalions of each regiment were so weak that he was ashamed to mention the figures. This, of course, made it impossible for commanding officers properly to exercise their commands, and militated against the general efficiency of the army organization. The Hungarian delegation listening to this statement of military conditions, however, took it as a criticism of the delay in the adoption of new military laws which had been discussed at length in the Parliament at Budapest.

The annual manoeuvres for 1911 took place from September 12 to 15 in the valley of Dukla. The troops taking part were the tenth, eleventh, and sixth corps.

NAVY. At the end of 1911 the navy included: Six first-class battleships, aggregating 74,613 tons; six coast defense vessels, 41,700 tons; three armored cruisers, 18,800 tons; six cruisers, 19,533 tons; fourteen destroyers, 5762 tons; forty-three torpedo boats, 6899 tons; six submarines, 1686 tons; total, 167,993 tons. The foregoing, regarded as the effective navy, do not include vessels over twenty years old, transports, colliers, repair ships, etc., torpedo craft of less than fifty tons, and other craft of less than 1000 tons. The naval programme, to be completed by 1916, includes the following vessels, under construction or ordered at the end of 1911: Four battleships (dreadnought type), 80,000 tons; three cruisers, 10,449 tons; six destroyers, 4800 tons; twelve torpedo boats, 2400

tons; six submarines, 1800 tons; total, 99,449 tons. The battleships *Radetzki* and *Zrinyi*, of about 14,300 tons each, were completed on January 15 and September 15, respectively, 1911. Of the four dreadnought battleships under construction, the first, the *Viribus Unitis*, was launched June 24, 1911. This vessel and the second, the *Kaiser Franz Joseph*, are expected to be completed in 1913, and the second pair in 1915. Each of these four is to have a displacement of upward of 20,000 tons and a primary armament of twelve 12-inch guns. The 1911 budget provided for an active personnel of 17,277 officers and men. See **NAVAL PROGRESS** and **BATTLESHIPS**.

GOVERNMENT. The sovereign in 1911 was Franz Joseph I., who was born August 18, 1830, and became emperor of Austria December 2, 1848, and king of Hungary June 8, 1867. His nephew, Archduke Franz Ferdinand, born in 1863, is the heir-presumptive. The ministers at the end of 1911 were: Premier and Minister for Foreign Affairs, Aloys (Count) Lexa von Aehrenthal (appointed 1906); Finance, Stephan (Baron) Burián von Rajecz (1903); War, General Mortiz (Ritter) von Auffenberg (1911). Austria and Hungary have each a representative Parliament of two houses and a responsible ministry appointed by the sovereign. Premier of Austria, Karl (Count) Stürgkh; of Hungary, Charles (Count) Khuen-Héderváry. Croatia and Slavonia and each province of Austria have separate diets.

HISTORY

INTRODUCTION. In 1910 and 1911 as in the preceding year, public interest shifted from the so-called "forward policy" which had made so large a part of political discussion in the three preceding years, and centred rather upon internal problems, of which the race and language questions were the chief. It will be remembered that upon the annexation of Bosnia and Herzegovina in October, 1908, there was much apprehension throughout the world that a European war would be the outcome and much concern over the apparent design of Austria-Hungary to pursue an aggressive policy. These fears, however, were not realized. A peaceful adjustment with Turkey was reached early in 1909 and a little later the war with Servia, which at one time seemed inevitable, was thwarted by her complete acquiescence in the Austrian demands. In 1910 friendly relations with Russia, which had been interrupted by the annexation and the events which followed, were resumed. Early in that year Bosnia and Herzegovina became a component part of the empire and their new constitution was published on February 21. Throughout 1910 the von Bienerth ministry tried to carry out a conciliatory policy on the race problem, especially as regards the language question, and promoted attempts at compromise between the Germans and the Slavs. But though conferences were held between German and Czech representatives, it was impossible to reconcile their conflicting claims. The question divided the political groups in Parliament and disorganized the national bloc on which the government relied. The ministry was further weakened by the demands of the Czechs for expenditures upon canals in Galicia which the revenues did not justify. The disorganization

of its majority prevented the government from carrying through its measure of fiscal reform.

GENERAL POLITICAL SITUATION. The political situation at the beginning of the year 1911 may be briefly outlined as follows: In the latter part of December, 1910, the von Bienerth ministry resigned, owing to the refusal of the Poles to support the government. This defection of the Poles from the coalition was caused by their dissatisfaction with the government's attitude on the canal question. The Poles continued to demand the carrying out of the Koerber law of 1901 for the construction of waterways and canals in Galicia. The cost of this work was greatly underestimated at first and the government found it impossible under its present heavy financial burdens to carry it into effect. The public debt had increased by 21,000,000 crowns over the previous year, and to meet this deficit an increase in the income tax and succession duties was proposed. In the meanwhile there was much agitation throughout the country on account of the rise of wages and the increased cost of the necessities of life. Consumers' associations were formed to protest against the commercial treaties, and especially objection was raised against the duties on cereals and meats. The Agrarians, on the other hand, explained the higher prices as arising from the higher standards of living, increased profits of the middle man and the higher wages of farm laborers. As to the high price of the meat in particular, they attributed it to the scarcity of forage in 1908 and 1909 and to cattle diseases, and they demanded a more complete closing of the frontier and a more stringent control of imported meats. The government depended for its support in the Reichsrath on the Agrarians and it took only half-way measures to allay the discontent. In spite of these difficulties the Poles insisted that the Koerber law be put into effect and that work be begun on the canal to link the Oder with the Danube, and the Danube with the Vistula. The finance minister, M. de Bilinski, himself a Pole, declared that this would be impossible and the cabinet supported him in refusing the demand. The Poles withdrew their support in the discussion of the budget and the von Bienerth ministry thereupon resigned (December 13, 1910), but Baron von Bienerth was asked to retain his office and constitute a new cabinet.

An important element in the political situation was the failure to compromise the language dispute in Bohemia between the Czechs and the Germans, which for the past three years had been so acute as to check all business in the Bohemian diet. During the last three months of 1910 conferences were held between German and Czech representatives for a compromise on this question. Out of 7460 communes of Bohemia, 6750 spoke only a single language. Of these two-thirds were Czech and one-third German. In 650 communes both languages were spoken. Where one nationality was in the minority, it demanded safeguards against denationalization and the suppression of its own language. The compromise proposed rested on the principle that the communes and even the small judicial and administrative subdivisions should be free to choose their official language, and that their relations with the higher civil authorities should be through an official intermediate bureau which should translate the language of one into the language of the authorities.

The Czechs, however, rejected this as tending to destroy their sovereignty over the two million Germans in the country, and as invading the historic right of the kingdom of Bohemia to remain indivisible. Finally, the negotiators, frightened by the protests or the radical element among the electors, separated without making any agreement. The financial situation was serious owing to the discord in the diet and necessary financial laws could not be passed. The Germans, having failed to reach any compromise on the language question, refused to cease their obstructive tactics. Each nationality naturally attributed the failure of the negotiations to the obstinacy of the other.

THE THIRD VON BIENERTH MINISTRY. The Reichsrath reopened on January 17, 1911. The Czechs demanded a parliamentary ministry, based on the Slav majority in the Reichsrath, but this Baron von Bienerth refused, declaring that a parliamentary ministry should rest on a strong majority, supported by the principal parties and determined to take action on the important legislative measures of the year, especially the budget, fiscal reform, the new military law providing for a two years' service, a new code of military justice, and social legislation, including measures of insurance against invalidism and old-age. Failing to establish a parliamentary ministry, Baron von Bienerth constituted his cabinet as follows: Minister of Railways, Dr. Glombinski, a Pole; Minister of Commerce, Dr. Weiskirchner, Christian Socialist; Minister of the Interior, Count Wickenburg; Minister of Public Works, Herr Marek, a Czech official; Minister of Finance, Dr. Meyer; Minister of Justice, Dr. Hochenburger; Minister of National Defense, Baron de Géorgi; Minister for Galicia, M. de Zalenski; Minister of Public Instruction, Karl (Count) Stürgkh; Minister of Agriculture, Baron von Wildmann, a German; and President of the Council, Baron von Bienerth. To obtain the support of the Poles, the ministry promised to revive the canal question and not to oppose the construction of waterways for Galicia. Herr Marck's appointment was due to a desire to conciliate the Czechs. In general, the Germans were dissatisfied with the ministry, which seemed to make too large concessions to the anti-German element. On the other hand, it was said that the cabinet had been formed without making any new national concessions to the Slavs, and that the government rested on the principle that no concessions should be made except as the result of compromise between the races themselves.

FAILURE OF THE VON BIENERTH GOVERNMENT. The ministry was soon confronted by demands on the part of the parties constituting the majority which it could not satisfy. There was an increasing insistence upon a purely parliamentary ministry, the Czechs and the Slavs of the south complaining that they were not represented in the cabinet. Besides the ever disturbing language issue, the government was embarrassed by the growing dissensions of the majority upon which it depended for support. The Christian Democrats, after the death of Dr. Lueger in March, 1910, were enfeebled by the rivalries of their chiefs, who disputed among themselves for the leadership. The representatives of the cities voted for higher duties to win the support of the Agrarians, thus raising the cost of necessities. Charges of corrup-

tion were made against them, and the party as a whole became disorganized. This was its condition in the spring, and as it was the centre of the coalition upon which the government relied, the situation seemed precarious. Another party in the government coalition was the Polish club, and this, too, was divided into rival factions. Among the adversaries of the government were the Socialists, with eighty-seven votes. Their opposition was very bitter and they took advantage of every opportunity to embarrass the government. The government had to face the prospect of weak support at a time when it was about to present two very important measures, namely, the new military law, and the financial reform necessary to yield the supplies required by that law. Under the terms of the new military law, the term of service was reduced from three to two years for the infantry, and the annual contingent of recruits would have to be increased in proportion to the diminution of the length of service. Thus additional expenses were entailed. It was estimated that after three years the increase in the effectives would be about 58,000 men, making a total in time of peace of 344,000. There was to be a corresponding increase in the navy. (See above paragraphs on *Army and Navy*). The object of these additions was to bring the Austro-Hungarian army and navy up to a strength proportionate to that of the other great powers. The budget which provided for these plans had been accepted by the joint Delegations on February 28, but there was much opposition in the press and the Socialists organized monster demonstrations against this great increase in the burden of militarism.

The Reichsrath heartily approved the reduction in the time of service and other features of the measure, but the great increase in the expenses frightened the deputies. Already the people were burdened with taxes and complaints of the increased cost of living were heard on all sides. The only means of carrying through the measure without unduly increasing these burdens was by the introduction of fiscal reforms. These could not be delayed without falling into serious financial difficulties, for the new dreadnoughts had already been ordered. With its present uncertain and shifting majority the government feared to trust the fate of these important measures to the Reichsrath. The opposition, apparently wishing to take advantage of the situation, demanded the reconstitution of the ministry on a parliamentary basis. At this turn of affairs, Baron von Bienerth unexpectedly ordered a dissolution in March. The elections began on June 13. The result was a crushing defeat of the Clericals and the Christian Democrats. The latter, confident of victory, had urged the government to dissolve the Reichsrath. They had long been entrenched in Vienna and were in control in Lower Austria. They had the advantage of the government support, of the avowed protection of the court, and of the active intervention of clergy and episcopate. But the charges of corruption against their leaders, and especially the action of their representatives in voting for higher duties, raised an unexpectedly bitter opposition, and of the twenty seats which they had held from Vienna they retained only two. They met with the same defeat in Lower Austria where they retained only two seats. The Clericals met with great losses in the Slave districts of Bohemia, Moravia, and

Galicia. Thus the strongest supporters of the government were crushed. The Socialists, against whom Agrarians and Conservatives had united, lost in the provinces, but these gains were offset in Lower Austria and Galicia, so that their number remained the same. The German Liberals made very considerable gains, and became the most powerful of the national groups. Thus, as a result of the elections, Baron von Bienerth found himself without a majority. The Christian Democrats, holding him responsible for their defeat, withdrew their support. The Slavs demanded the resignation of the cabinet and the formation of a ministry to suit their wishes. The German Liberal groups with their increased representation opposed any ministry that should be composed of the different nationalities. At this crisis the von Bienerth ministry resigned and Baron Gautsch von Frankenthurn was summoned to form a new cabinet.

FALL OF THE GAUTSCH MINISTRY. On September 17 the Socialists organized a demonstration in Vienna, and at a mass meeting blamed the authorities for the increased cost of living and the scarcity of dwelling houses. Fighting in the streets followed, and there were ninety cases of injury reported. Many of the rioters were arrested and severe sentences imposed upon them. On the opening of the autumn session on October 5, the spirit of popular discontent was reflected in the Reichsrath where the closing of the Czech schools in Vienna occasioned an outbreak, and where Dr. Adler, the Socialist leader, in a two hours' speech, violently denounced the government policy in the matter of the cost of living and of the recent food riots. At the conclusion of his speech shots from a revolver were fired against the ministerial benches, striking the woodwork near by. The session broke up, and the criminal, a Dalmatian workman, was arrested. He confessed that he had fired the shots at the minister of justice to avenge the victims of the sentences passed by the courts on the food rioters in Vienna. At the end of October the Gautsch cabinet, failing to find a majority and unable to suppress the bitter attacks of the Socialists, resigned and the minister of public worship, Count Karl von Stürgkh, was summoned to form a new cabinet. There was another scene of violence in the Reichsrath on November 10, when two Pan-German deputies came to blows, one of them attacking the other with a whip.

OTHER EVENTS. Early in March King Ferdinand of Bulgaria visited the emperor. The emperor and empress of Germany paid a visit to Vienna on March 24. In September the emperor accepted the resignation of General Baron von Schönaich, the Austro-Hungarian minister of war, who was succeeded by General von Auffenberg. His retirement was attributed to conflict of opinions between the war minister and a member of the imperial family. The war between Italy and Turkey was the subject of much discussion in the empire where it was feared that Italy would not confine her military operations to Africa. On December 1, Baron Hoetzendorf, chief of the general staff, and regarded as one of the ablest officers of the army, retired from office, owing it was said, to differences of opinion with Count Aehrenthal as to the future of the Triple Alliance. He was believed to have urged the government to take certain measures, on the assumption that Italy

would attack Austria after possessing herself of Tripoli. This was not in conformity with Count Aehrenthal's policy, which required an attitude of good will, but at the same time of firmness toward Italy. The situation was complicated by the fact that the heir-apparent was believed to be in sympathy with Baron von Hotzendorf.

AUTOMOBILE FIRE APPARATUS. See **FIRE PROTECTION.**

AUTOMOBILES. During 1911 the prosperity in the automobile industry which has distinguished it since the beginning, continued unabated. The type of motor car has now reached practical standardization. The changes are largely in detail and refinement.

NUMBER OF AUTOMOBILES IN USE. It is difficult to arrive at the exact number of automobiles of all types in actual use in the United States. A careful investigation carried on by the *Automobile* shows approximately 677,000 automobiles in 1911, or one to every 140 of the population. The total number of registrations in all the States up to the close of the year was 717,875. Of these 194,501 were registered during the year. There are, however, many duplications in the registration, so that the total number of motor cars of all types is, as stated above, about 677,000. The largest number of registrations are in New York, where 84,989 cars are registered. California is second, with 59,202; New Jersey third, 48,266; Ohio fourth, 45,739; Pennsylvania fifth, 44,182. These figures relate to ordinary automobiles. In addition, there were registered 25,451 commercial vehicles. Of these 5081 were registered in New York, 2063 in California, and 2062 in Pennsylvania. According to the figures compiled by the *Automobile* there were produced during 1911 by all manufacturers 209,957 cars. These were divided as follows: Gasoline pleasure cars, 194,665; electric pleasure cars, 5634; gasoline trucks, 8500; electric trucks, 853; fire department vehicles, 305.

CHANGES IN CONSTRUCTION. The changes in construction during the year above mentioned are chiefly in matters of detail and in refinement of present construction. Perhaps the most notable feature of the year was the increasing popularity of the double-sleeved motor. Several manufacturers discarded entirely the poppet-valve type of motor. The increased manufacture and sale of six-cylinder cars was a feature of the year. For a time there was doubt if such cars could be sold, but several of the high-priced car-makers began the manufacture of this type and made it a success. Notable improvements have been made in the four-cylinder type, with the general trend toward a longer stroke. In the bodies of the cars there has been little radical change. The most notable is the prevalence of the fore-door type. There was considerable change in the matter of the control of cars. The change of placing the steering column on the left side was well received. Several of the high-priced manufacturers now place it in this position. The limousine type of cars continued in popularity during the year. Many of the touring cars, selling at \$2000 and under, were fitted with limousine bodies and the price was placed around \$3000. The self-starter became a feature of many cars.

MANUFACTORIES. Many new automobile factories were established during the year. It is

difficult to arrive at the exact number of manufacturing factories, but those who turn out fifty cars or more a year number about 420. The value of the buildings and equipment of these manufacturing factories is about \$70,000,000. The value of the automobiles made in 1911 is approximately \$272,000,000.

MOTOR TRANSPORTATION. The most important feature of the industry in the last few years has been the increasing use of motor cars for transportation purposes. As noted above there were in 1911 25,451 motor trucks in the United States. During the year 1911 9658 commercial vehicles of all sorts were produced by the American truckmakers. The value of these trucks is about \$56,000,000.

EXPORTS. The increasing value of exports of automobiles from the United States is shown by the figures of the Bureau of Statistics. The exports in 1911 were valued at \$21,636,661, compared with \$14,030,226 in 1910, and \$4,409,186 in 1906. Equally significant is the decrease of imported cars. The value of these in 1911 was \$2,446,248, compared with \$2,737,208 in 1910, and \$4,910,208 in 1906. These figures indicate clearly the increasing popularity of American cars. Most of the automobiles exported from the United States go to British territory. The cars exported into Canada in 1911 were valued at \$7,180,547, or one-third the value of the entire number exported. To the United Kingdom were exported cars to the value of \$3,700,095. Cars in considerable quantity were also exported to France, Germany, Mexico, and Australia. The principal source of the cars imported into the United States is France. Some cars, however, are brought from Germany, from the United Kingdom, and from Italy.

For the employment of automobiles in fire protection see article **FIRE PROTECTION.**

RACING EVENTS. The principal events of 1911 were the Vanderbilt Cup race at Savannah, the Grand Prize race at Savannah, the National races at Elgin, Ill., the Grand Prix races at Boulogne-sur-Mer and Le Mans, France, and the road races at Fairmount Park, Philadelphia, and Santa Monica, Cal. Many new records were established during the year, Harvey Herrick, David L. Bruce-Brown, Ralph Mulford, Robert Burnam, and Ray Harroun being the drivers who carried off the majority of the laurels.

The Vanderbilt Cup race of 291.38 miles was won by Ralph Mulford, who in a Lozier covered the distance in 3 hours, 56 minutes, 67 seconds. This indicated an average speed of 74.07 miles per hour, a new record for this event. Ralph de Palma finished second in the Vanderbilt in a Mercedes, and Spencer Wishart, also in a Mercedes, was third. The Grand Prix contest was won for the second year in succession by David L. Bruce-Brown in a Fiat. His time for the 411.36 miles was 5 hours, 31 minutes, 29.13 seconds, or at the rate of 74.45 miles an hour. In 1910 the same driver in a Benz went 415.2 miles in this event at an average speed of 70.55 miles per hour.

The Elgin National (305 miles) was won by "Len" Zengel in a National car. The driver's time was 4 hours, 35 minutes, 39 seconds, or an hourly average of 66.42 miles. In the Grand Prix races in France Bablot, a Frenchman, was the winner of the event for light cars, his time for the 388 miles being 7 hours, 2 minutes.

The contest open to heavy cars was won by Hemery of France, who covered 395 miles in 7 hours, 6 minutes. The Fairmount Park race was won by E. Bergdoll, who drove a Benz car over the course of 202.5 miles at an average hourly speed of 61.15 miles. In the free-for-all road race at Santa Monica Harvey Herrick in a National car was the winner. He went the 202 miles at the rate of 74.62 miles an hour.

The most important of the records made during 1911 follow: Speedway—1 kilometer, Burman in a Benz, 21.40 seconds; 25 miles, Tetzlaff in a Lozier, 18 minutes, 22.6 seconds; 50 miles, same driver, 36 minutes, 35.8 seconds; 75 miles, same driver, 54 minutes, 50.2 seconds; 100 miles, same driver, 1 hour, 14 minutes, 29.2 seconds; 150 miles, Bruce-Brown, in a Fiat, 1 hour, 57 minutes, 15 seconds; 200 miles, same driver, 2 hours, 39 minutes, 28 seconds, 300 miles, Harroun, in a Marmon, 4 hours, 1 minute, 25 seconds; 400 miles, same driver, 5 hours, 23 minutes, 15 seconds; 500 miles, same driver, 6 hours, 42 minutes, 8 seconds. Straightaway—1 kilometer, Burman in a Benz, 15.88 seconds; 1 mile, same driver, 25.40 seconds; 50 miles, same driver, 35 minutes, 52.3 seconds; 200 miles, Disbrow in a Special, 2 hours, 34 minutes, 12 seconds; 300 miles, same driver, 3 hours, 53 minutes, 33.50 seconds. Circular Track—1 mile, Burnam, in a Benz, 48.62 seconds; 50 miles, De Palma, in a Simplex, 47 minutes, 21.65 seconds.

AVIATION. See AERONAUTICS; MILITARY PROGRESS; NAVAL PROGRESS.

AVIATION SICKNESS, *Mal des Aviateurs*. Crutchet and Mouliner of Bordeaux apply this name to the congeries of symptoms experienced by aviators during rapid ascensions and still more rapid descents. They made scientific examinations of the participants in various French aviation meets and detail the following phenomena: During the ascent, respiration becomes more rapid and shallow and the pulse increases in rapidity at a height of 1500 meters. An indefinable malaise develops, but nausea is not present. A slight deafness is experienced at the height of 1000 meters and at a somewhat greater height noises in the ears commence. Vision remains unimpaired. Some of the other sensations which have been remarked above 2000 meters are headache and sensation of cold and an intense desire to urinate; while the movements of the body become brusque and jerky. The morbid phenomena which distinguish the descent are a sensation of anguish similar to that which accompanies the sudden descent of an elevator, violent palpitations, gradually increased noises in the ears, and a more imperative desire to micturate. A characteristic symptom is a burning sensation of the face, smarting of the eyes, and an almost irresistible desire to sleep. After landing, the aviator does not recover from these sensations for a considerable time. Respiration quickly returns to normal, but arterial hypertension is still well marked and persists for a long period after the flight is finished. These symptoms are evidently caused by rapid changes in the atmosphere, cold, and speed, as well as by nervous excitement.

BAHAMAS. A British colony composed of twenty inhabited islands and numerous uninhabited isles, islets, and rocks, lying southeast of Florida. Area, 5450 square miles. Population in 1901, 53,735; in 1911, 55,944. Births (1909), 2167; deaths, 1173. Capital, Nassau, on New Providence Island. Government and mission schools (1909), 110, with 9952 pupils enrolled; secondary schools (private), 5, with 167 pupils. Sponge and turtle fishing, and sisal and fruit culture are carried on. Canning and sisal factories and lumber mills employ native labor. Domestic exports of cotton in 1908, 13,090 pounds; 1909, 11,931. Livestock (1909-10), 1680 cattle, 12,881 sheep, 991 horses. Imports (1909-10), £329,014; exports, £193,803; tonnage entered and cleared (1909), 1,294,651; revenue, £84,386; expenditure, £85,315; public debt, £55,639. Governor (1911), Sir William Grey-Wilson.

BAILEY, J. W. See TEXAS.

BAILEY, MARK. An American elocutionist and educator, died June 4, 1911. He was born in 1827. He was a well known elocutionist in his early days and coached Lincoln during his debate with Stephen A. Douglas. He rode in Lincoln's carriage and usually preceded Lincoln and Douglas with a preliminary speech. He was for fifty years instructor in elocution at Yale University, a position which he held until 1905.

BAIRD, JULIAN WILLIAM. An American chemist, died June 26, 1911. He was born in Battle Creek, Michigan, in 1859, and graduated from the University of Michigan in 1882. For two years he was assistant in chemical analysis at that institution and from 1883 to 1886 was instructor in qualitative chemical analysis and assaying in Lehigh University. In 1886 he became professor of analytical and organic chemistry in the Massachusetts College of Pharmacy. From 1895 to the time of his death he was dean of the college. He occupied a prominent position as a chemist and was a member of many chemical societies.

BAKER, NEWTON D. See OHIO.

BAKER, GEORGE HALL. An American librarian, died March 27, 1911. He was born in Ashfield, Mass., in 1850 and graduated from Amherst College in 1874. From 1876 to 1878 he studied at the University of Berlin. From 1884 to 1889 he lectured on bibliography at Columbia University. He was librarian-in-chief of that university from 1889 to 1899 and from the latter date to the time of his death was librarian emeritus. He wrote extensively on art topics, and was editor-in-chief of the Cosmo collection.

BAKER, Sir RICHARD CHAFFEY. An Australian public official, died in March, 1911. He was born at North Adelaide in 1842 and was educated at Eton and Trinity College, Cambridge. He was called to the bar in 1864 and in the same year returned to Australia, where he engaged in the practice of law. In 1870-71 he was attorney-general and from 1877 to 1901 was a member of the legislative council. In 1884-85 he was minister of education. He acted as special commissioner to negotiate several agreements between Great Britain and the colonies. From 1893 to 1901 he was president of the legislative council of South Australia. In the latter year he resigned and entered the federal

parliament. He took a prominent part in the federal movement and was a member of the Sydney conference of 1891 and of the national convention which framed the Commonwealth constitution in 1897-8. He was elected to the first senate in 1909 and became its president. He was reelected to this office in 1904 and held the office until the time of his death. He represented the Commonwealth at the Durbar at Delhi in 1903. He was the author of the *Federal Manual*, and *Constitution of South Australia*, and was a recognized authority on constitutional law and parliamentary practice.

BAKUBA. See ANTHROPOLOGY.

BALDWIN, CALEB COOK. An American missionary, died July 20, 1911. He was born in Bloomfield, N. J., in 1820, and graduated from the Princeton Theological Seminary in 1846. Upon his ordination two years later he was sent to Fuchow, China, by the American Board of Missions of the Presbyterian church. This began a service of fifty years of missionary work in China, and during this period he returned to the United States but three times, in 1859, in 1871, and in 1885. In 1895 he returned permanently to the United States. He translated the Bible into Chinese and compiled a Chinese-English dictionary of 3000 pages. In recognition of his labors in behalf of the Chinese a memorial is to be erected at Fuchow.

BALFOUR, A. J. See GREAT BRITAIN, *History*.

BALL, THOMAS. An American sculptor, died December 11, 1911. He was born in Charlestown, Mass., in 1819 and was educated in the Mayhew School in Boston. For many years he practiced painting and attained a considerable reputation. In 1851, however, he took up sculpture and devoted practically the remainder of his life to that art. From 1865 to 1897 he lived in Florence, Italy. He then returned to the United States. Among his best known works are the equestrian statue of Washington in Washington, the Lincoln Emancipation group in the same city, the statue of Governor Andrew in the State House in Boston, the statue of Daniel Webster in Central Park, New York, and a statue of Charles Sumner in the Boston Public Gardens. In addition to his work as a sculptor, Mr. Ball had great musical ability and was a member of the Handel and Haydn society. In 1848 he sang the part of Elijah in the oratorio of that name, the first performance in America. He was the author of an autobiography entitled *My Three Score Years and Ten*, and numerous lyrics and minor poems.

BALTIMORE. See MARYLAND.

BAMBOO PULP. See CHEMISTRY, *INDUSTRIAL*.

BANFFY, DESIDERIUS, Baron. A Hungarian public official, died May 24, 1911. He was born at Klausenburg, Transylvania, in 1843. He was educated at the universities of Leipzig and Berlin. He entered the government service and became prefect of various colonies of Transylvania. As holder of this office he was ex officio member of the House of Magnates. He was elected deputy and in 1892 became president of the lower house. On the resignation of the Wekerle cabinet in 1895 he was entrusted with the formation of a new ministry. During his administration as premier he rendered conspicuous service to the Liberal cause. He re-

signed both the premiership and his mandate as deputy in 1900.

BANKS, DAVID. An American publisher, died March 11, 1911. He was born in New York City in 1827 and entered the publishing house of his father, David J. Banks, who founded the first firm of law publishers in the United States. He continued in business with his brother Charles and Anthony Bleecker Banks until 1899, when the company dissolved and David Banks with his son, David, Jr., formed a corporation known as the Banks Law Publishing Company. He was well known as a yachtsman and was twice commodore of the Atlantic Yacht Club. He was also a member of many patriotic societies, among them the Society of Colonial Wars and Sons of the Revolution.

BANKS AND BANKING. This article gives a statement of the condition of United States banks in 1911, and a discussion of banking reform, the proposed bank money-order system, and the legal aspect of the guarantee of deposits in State banks. In addition to the matter here presented, the reader should consult the following articles: NATIONAL BANKS; STATE BANKS; SAVINGS BANKS; POSTAL SAVINGS BANKS; LOAN AND TRUST COMPANIES; NATIONAL MONETARY COMMISSION; and FINANCIAL REVIEW.

RESOURCES AND LIABILITIES. The aggregate resources of the 24,392 banks of the United States and island possessions reporting to the Comptroller of the Currency on June 7, 1911, were \$23,631,000,000. This was an increase of nearly \$4,000,000,000, or more than 20 per cent., during the past four years. The number of banks reporting included 7277 national, 12,864 State, 635 mutual savings, 1249 stock savings, 1116 private banks, and 1251 loan and trust companies. The national banks were credited with 43.9 per cent. of the aggregate resources; the loan and trust companies with 19.7 per cent.; the mutual savings banks with 15.9 per cent., the State banks with 15.8 per cent., and the stock savings banks with 3.7 per cent. The resources of the private banks were less than 1.5 per cent. of all; it should be stated, however, that of the more than 4000 private banks and bankers in the United States less than 30 per cent. actually reported. Among the resources, the principal item was \$13,046,000,000 of loans and discounts. Of this vast sum 43.3 per cent. was credited to the national banks and about 18 per cent. each to the State banks and to the loan and trust companies. The resources also included bonds and securities valued at \$5,052,000,000 and cash amounting to \$1,554,000,000. This cash included \$856,425,000 in gold coin and gold certificates.

Among the liabilities were: Capital stock, \$1,952,000,000; surplus and undivided profits, \$2,065,000,000; deposits, \$15,906,000,000. Of the deposits, \$8,308,000,000 were individual deposits subject to check without notice, and \$5,446,000,000 were savings deposits. The national banks were credited with 32.8 per cent. of these deposits, the loans and trust companies with 20 per cent., the mutual savings banks with 21.5 per cent., and the State banks with 17.5

per cent. Compared with 1900 there was an increase of 90 per cent. in capital and 120 per cent. in individual deposits.

The geographical distribution of the banks shows that there were 8167 in the Middle Western States; there were 5765 in the Southern States; 4899 in the Western States—that is, the States from Dakota to Montana on the north and to Oklahoma and New Mexico on the south, inclusive; there were 2844 in the Eastern States; 1604 in the Pacific States; 1079 in the New England States; and 34 in the island possessions. With respect to aggregate resources, however, the Eastern States easily outrank all the others, with a total of \$10,009,000,000; this mainly due to the preëminence of New York banks, which State alone showed aggregate resources of \$6,413,000,000. The banks of the Middle Western States had aggregate resources of \$5,738,000,000, and those of New England, \$2,933,000,000. Then came those of the Southern States, with \$2,178,000,000; those of the Pacific States and Western States coming last. This same order was maintained with respect to loans, surplus, and deposits. The State of Iowa had the largest number of banks, 1427. Then came Pennsylvania and Missouri, with 1292 each. Illinois with 1228, Texas with 1188, Kansas with 1082, and Ohio with 1065.

BANKING POWER. Under this term is included the sums of the capital, surplus, and other profits, deposits, and circulation of banks. The total in June, 1911, was \$21,334,000,000, as reported by the 24,392 reporting banks, together with an estimate for 4159 non-reporting banks. The principal item was \$16,514,000,000 for deposits. The remainder, except \$681,740,000 national bank note circulation, was charged to capital, surplus, and other profits. The total was \$3,600,000,000 more than three years earlier, and more than double that of 1900.

BANKING REFORM. For many years the discussion of plans for the reformation of the banking and currency systems of the United States has been carried on almost continuously. This discussion has been especially active since the panic of 1907, with its complete demoralization of banking credit, and particularly since the appointment in 1908 of the National Monetary Commission expressly authorized to investigate banking and currency conditions throughout the world and to propose a plan for legislation. The principal defect which all students have found in the American banking and currency systems is the lack of elasticity, that is, the lack of power to adjust the volume of currency to the volume of business. Indeed it is often pointed out that our currency is perversely elastic, it expands when it should contract and contracts when it should expand. This is due to the fact that it is based on government bonds in such a way that about \$105 of legal money is required to secure \$100 of national banking notes for circulation. The result is that when currency is abundant the banks have found it profitable to buy more bonds, which become the basis for still greater increase in note circulation. On the other hand, when interest rates are high the banks have often preferred to retire their notes and sell the bonds on which they were based, thus securing a somewhat enlarged amount of money for loaning at the high rate. The best means of introducing elasticity is, by general agree-

ment, the introduction of the asset currency principle. By this, banks would be permitted to issue additional notes on the basis of commercial paper and securities of various kinds representing actual business transactions and sound industrial values. When, therefore, the volume of business increases additional notes could be issued to transact it, these notes being retired when no longer needed.

Another serious defect is the lack of coöperation, or undue individualism, in our banking system. The result of this is that each bank in times of stress has stood almost alone, hence each has felt compelled to increase and defend its reserves in times of declining confidence rather than to lend aid to a needy neighbor. Under our present system not less than one and one-fourth billion dollars are scattered about over the country in about twenty-five thousand different banks. All of this huge sum is idle in normal times and in panic periods is so distributed as actually to delay or prevent the restoration of confidence. Bankers and economists have, therefore, almost unanimously agreed that what is needed is some means of centralizing these reserves into a common fund. They would then be available for rediscounting the commercial paper of individual banks, thus greatly increasing their banking power. They would also be available wherever and whenever unusual business demands arose. They would especially be usable in times of incipient panic as a means of checking the shrinkage of credit and the disappearance of confidence.

Added to these two major defects, and perhaps incidental to them, is the lack of control over improper banking methods and undue tendencies toward speculation. It is therefore generally agreed that to the mobilization of bank reserves should be added some means of increased supervision whereby over-expansion of banking credit at any point could be prevented by the banking world itself. Such supervision is exercised in the large cities by the clearing-house association over its members. It is exercised in foreign countries by the central banks, and in Canada by the principal banks over their branches. This opinion is a chief argument with those favoring the organization of a central bank in this country. It is clear that the introduction of the asset currency principle would involve great danger of inflation, unless the volume of issues were controlled by some central agency. It is generally agreed, therefore, that there should be formed some body, central bank or otherwise, having sole power to issue bank notes and to serve as the central reservoir for the concentration of bank reserves.

THE ALDRICH BANK PLAN. In January Senator Aldrich, chairman of the National Monetary Commission, announced a tentative plan for the reorganization of the banking and currency systems of the United States. This plan was not the approved plan of the entire commission, but was put forth by the chairman to secure discussion and criticism. A revised plan was submitted by Mr. Aldrich in October. Various suggestions for modification were made by a special committee of the American Bankers' Association and the plan was generally approved by the association at a special meeting at Atlantic City in February, and with only one dissenting voice, at the annual meeting at New Orleans in November. It was also approved by twenty-nine State

banking associations. Hearings were held on this plan by the commission in October at New York and other places. The chief reforms sought by the plan were the mobilization of reserves and the transfer of the note-issuing power from the government to the banks. The first was designed to increase the stability and mobility of banking credit and the second to give such elasticity to the currency as would make it adaptable to the fluctuating business needs of the country. The principal feature of this plan was the provision for the organization of the National Reserve Association. This was to be based on fifteen district reserve associations, each of which in turn was to be based on local associations of ten or more banks. The essential principle of the plan was coöperation among the banks of the United States rather than centralization, though many features of a central bank were incorporated. In the opinion of the formulators of this plan the organization of a central bank, patterned after such banks in Europe or after the Second United States Bank, was not feasible at this time, in view of the existing state of public opinion in this country. Indeed, one of the most ingenious features of the proposed plan is due to the efforts to prevent the control of the reserve association by any local or national political interests, by any corporation or combination of corporations, whether banks or otherwise, or by any combination of interests in Wall Street or elsewhere. It was expected that the plan set forth below would be modified in minor respects in the final report of the Monetary Commission to Congress on January 8, 1912.

ORGANIZATION: LOCAL ASSOCIATIONS. The plan provided for three sets of organizations, each resting on the one below, just as in the organization of our political institutions we have local, State, and national governments. At the bottom will be the *local associations*. These shall have corporate powers; shall be composed of at least ten banks with a combined capitalization, including surplus, of not less than \$5,000,000. All national banks, and all State banks and trust companies complying with certain specified requirements, may become members by buying stock in the National Reserve Association equal to, and not less than nor more than, 20 per cent. of their capital. Such shares shall not be transferable. The requirements for State banks and trust companies are designed to place them on a par with national banks by imposing on them similar conditions as to capital, surplus, reserves, and examination. The original plan limited membership to national banks, but this was strongly objected to on the ground that State banks and trust companies hold more than half the country's banking power. These local associations will choose directors for themselves and for the district associations; have certain functions of supervision of constituents, somewhat as clearing houses examine and tone up business methods of members; and, at times, they will guarantee commercial paper to be rediscounted by the central association. In choosing directors two methods of voting shall be followed: By the first method each bank, regardless of size, shall have one vote, and by the second, each bank shall have as many votes as it has shares in the National Reserve Association. Three-fifths of the directors of the local associations shall be chosen by the first method and two-fifths by

the second. The effect of this method of choosing directors is to give more influence to small banks than their size might otherwise warrant. This effect is designed to be realized throughout the entire organization, since a similar method of voting is followed in choosing the directors of the district and national associations. It is this feature which, added to the fact that each bank is to remain independent and self-directing, led Mr. Aldrich to dub the plan "local self-government in banking."

DISTRICT ASSOCIATIONS. All the local associations shall be grouped into fifteen district associations, the number to be increased from time to time. The directors of these district associations shall be twice as numerous as the number of local associations included in the district. One-half of them shall be chosen by ballot by the boards of directors of the local associations, each board choosing one district director. One-third of them shall be chosen by the second method of voting already described, each bank voting according to its shares in the national association. The remaining one-sixth shall be chosen by these five-sixths, these last not to be bank officers (though they may be bank directors) and to represent the agricultural, commercial, and industrial interests. Each bank shall have a manager and a deputy-manager, appointed by the executive committee of the national association. The functions of the district associations shall be to choose directors for the national association; to facilitate note issues and retirements, and domestic exchanges; to act as the discounting agent of the central body, and otherwise to increase the co-operation between local and national organizations.

NATIONAL RESERVE ASSOCIATION. The board of directors of the National Reserve Association shall number forty-five. Fifteen directors shall be elected by the boards of directors of each district, each choosing one; twelve directors shall be chosen by the representatives of these districts, each representative casting as many votes as all the banks in his district have shares in the national association. These twenty-seven directors shall elect twelve additional members, who shall not be bank officers, but may be bank directors, and who shall fairly represent the industrial (commercial, agricultural, and other interests of the country. The Secretary of the Treasury, the Secretary of Commerce and Labor, the Comptroller of the Currency shall be *ex-officio* members. All the preceding shall choose two deputy-governors, and shall submit a list from which the President of the United States shall appoint the governor of the association. The executive committee shall consist of nine members, including the governor, the two deputy-governors, the Comptroller of the Currency, and five other directors. The governor may be removed by a two-thirds vote of the board of directors for cause; the deputy-governors may be removed by a majority vote of the board for cause at any time. Powers and duties of the National Reserve Association shall be numerous and extensive. It may prescribe the powers and duties of branch officers and establish branches in foreign countries. It shall act as the fiscal agent of the government, receiving all government moneys on deposit without interest and pay all government obligations upon proper orders. It shall have power to buy and sell government and State securities;

the securities of foreign government; gold coin and bullion. It may deal in bills of exchange of certain types both at home and abroad, thus greatly expanding the market for such bills. It may make loans on gold coin and bullion. It shall have power to fix the rate of exchange through its executive committee, this rate to be uniform at all branches. It may discount the notes of depositary banks with the guarantee of the local association, if secured; it may rediscount notes and bills of exchange arising out of commercial transactions with the indorsement of the depositary bank made at least thirty days prior, but the total amount so rediscounted shall in no case exceed the capital of the bank applying, and the aggregate of such notes and bills bearing the signature or indorsement of any one person or firm shall not exceed 10 per cent. of the capital and surplus of the applying bank.

DISCOUNTS. One of the principal means whereby elasticity is introduced into the system is through the foregoing and other rules regarding discounts. The enormous amount of idle money held as reserve by individual banks under the present system will be deposited for the most part with the National Reserve Association, and become available for the rediscounting of notes and bills from member banks, as above indicated. Whenever a local bank rediscounts any security with the central body the proceeds thereof shall count as legal reserve for the local bank. Moreover the notes of the central body sent out to local banks to offset rediscounted securities may also be counted as legal reserve. A comparison of this method with the existing system shows that the discounting capacity of the banks will be very nearly doubled. Individual banks will first be able to discount about as much paper as at present, and then by rediscounting this paper at the central association will be able with this additional credit to discount a large additional sum of bills.

NOTE ISSUES. The plan provides for the limitation of national bank notes to the amounts now outstanding, all additional note issues to be made by the National Reserve Association. In the original plan a progressive tax on all such issues ranging from 3 per cent. on the first hundred million dollars to 6 per cent. on all above three hundred million dollars was provided. In the revised scheme it was provided that all issues in excess of nine hundred million dollars, but under one billion two hundred million dollars, and not covered by an equal amount of legal money on hand, should pay a tax of $1\frac{1}{2}$ per cent. per annum, and all issues in excess of one billion two hundred million dollars should pay 5 per cent. National banks may maintain their present note issues; but whenever a bank retires a part of its notes, it may not reissue them. The national association must offer to buy at not less than par the 2 per cent. bonds held by the national banks to secure their notes; the association must then assume responsibility for the redemption of the notes secured thereby, replacing them with notes of its own. The Secretary of the Treasury shall be required to accept such bonds in exchange for 3 per cent. fifty-year bonds upon which the association shall pay the government an annual tax of $1\frac{1}{2}$ per cent. These bonds will thus cost the government only $1\frac{1}{2}$ per cent. net annually.

After five years not more than fifty million dollars of such bonds may be sold annually, at the discretion of the Secretary of the Treasury. Moreover, the government may at any time retire such bonds or purchase them at par for postal savings banks. The aim of these provisions is to secure the retirement of as much of the present bond-secured circulation of possible. The note issues under this plan would be elastic, since they would be made in consequence of the rediscounting of commercial paper, as already noted.

RESERVE. All demand obligations, including deposits of the government and of member banks and all circulating notes of the association, must be covered to the extent of 50 per cent. by a reserve of gold or of other legal money of the United States. The other 50 per cent. may be covered by the various notes and bills of exchange, which the reserve association is authorized to rediscount. Whenever the reserve of gold and legal money falls below 50 per cent. the National Reserve Association must pay a tax of $1\frac{1}{2}$ per cent. annually for each $2\frac{1}{2}$ per cent or fraction thereof of such deficiency. The notes of the association may be used as legal reserve by member banks, in addition to the gold and legal money now so usable.

PROFITS. The plan provides that the National Reserve Association shall not be run for profit. Thus a dividend of only 4 per cent., but cumulative, shall be paid to stockholders, that is, member banks. Any profit beyond that shall be divided as follows: One-half shall go to the surplus of the association; one-fourth to the United States government, and one-fourth to the stockholders until they shall have received an additional 1 per cent., or 5 per cent. in all. Thereafter the remaining profits, if any, shall be divided equally between the government and the surplus, until the latter equals 20 per cent. of the capital, and thereafter all profits should go to the government. In brief, stockholders may get not more than 5 per cent. per annum, and the government will get all profits above this, when a surplus of 20 per cent. of capital has been accumulated.

OPINION. Opinion was very widely divided as to the advantages and disadvantages of the proposed plan, though the press generally reserved judgment until discussion had illuminated the plan. Thus the formulator of the plan and numerous leading bankers held that the scheme of organization successfully precluded any possibility of control by Wall Street or any other financial or political interest. Leslie M. Shaw, former secretary of the treasury, on the other hand, asked whether "any one is credulous enough to suppose that Wall Street will be unable to control each and all of the fifteen groups." He contended that "the interests" would be able to dictate loans, effect developments in various lines in all parts of the country; and that they could fix the prices of cotton, wheat, and other products; that "it puts business absolutely and irretrievably in the hands of Wall Street." *Moody's Magazine* said: "If such an institution were established it would absolutely control American commerce as well as all our banking and insurance operations. It would be more powerful than the government."

Similarly, although Mr. Aldrich and many others placed great confidence in the provisions for the exercise of control by small banks, others

pointed out that it might be possible by skillfully gerrymandering the districts or by the organization of a few new banks here and there to throw the entire control into the hands of certain designing interests.

While some asserted that the National Reserve Association was a central bank under a different name, others, as Mr. MacVeagh, Secretary of the Treasury, held that the plan answered all objections to a central bank. The secretary stated that it differed from a central bank in not being a competitor of banks and in not being run for profit; it will be an agency of all banks to perform certain necessary functions which the banks in their present disorganized relations cannot perform. So far from favoring centralization he thought the plan would secure democratic monetary control and check the present threatening tendency toward concentration of banking control.

Governor Folk of Missouri would have the directors appointed by the President, instead of by the banks, but ex-Comptroller of the Currency Dawes would have no governmental representation in the directorate, because this might introduce politics into the management.

ADVANTAGES. Among the advantages secured by the plan were mentioned the increased elasticity and control of note issues; the mobilization of bank reserves, and the increased facility with which they may be used for the support of any bank in any part of the country; the uniformity of the rate of discount, and the use of that rate to control the expansion of bank credits, and better supervision of banking practices. Mr. Aldrich contended that the new organization would not be in any way a competitor of existing banks, that the plan would result in a standardization of commercial paper, that greater stability and adjustability could be given to the entire banking and currency systems; that, through the provision of a much wider market for bills of exchange a greater stimulus would be given to domestic commerce; that, through the organization of foreign branches foreign trade would be stimulated and greater influence exerted in the money markets of Europe, and that, through the admission of State banks and trust companies under specified conditions and the authorization of savings departments in national banks with power to make loans on real estate, greater equality would be introduced into the relations of the various kinds of banking institutions. Other advantages mentioned were: Hoarding of millions in the public treasury would cease; the money market would no longer be disturbed by variations in the amount of public money; in times of stress banks will not need to call upon the treasury for aid.

CRITICISMS. Among the criticisms passed in addition to the feeling above noted that the whole banking system of the country might be controlled by selfish interests, the most general criticism was directed toward the method of choosing directors. It was pointed out that the plan will almost certainly place the control of its powerful institution in the hands of bankers. Professor Kemmerer and others held that this association is too important to be thus exclusively controlled by the banking interests, and that provision should be made for a wider representation of agricultural, industrial, and commercial interests and greater responsibility to the public. Some criticism was also directed to

the provisions whereby the notes of the reserve association may be counted as reserve by member banks. It was felt that this would open the way to the evils of inflation. Mr. Aldrich attempted to answer this by saying that it was illogical to allow member banks to count as reserve their credit with the central association and not to allow them to count the notes whereby such credit was discharged. In answer to his view it was stated that a local bank having credit with the central association might demand gold or legal money instead of association notes. The tax of 5 per cent. on note issues in excess of \$1,200,000,000 was not deemed high enough by some, who held that it would often be to the advantage of Western banks to pay this tax since they could receive 6 per cent. or even more on loans and discounts. Much doubt was expressed as to the ability of the reserve association to enforce a uniform discount rate.

BANK MONEY-ORDER SYSTEM. In 1905 the American Bankers' Association appointed a committee to investigate methods of transmitting money from place to place and report a plan for an improved method. The present methods of post office money-order, express company money-order, and bank drafts were not deemed sufficiently elastic and adaptable to meet the real needs of commerce. The committee inquired into methods at home and abroad and reported its plan later in the year. Their aim was to devise a scheme whereby an order issued at one part, however small or remote, would be payable at any other part. Taking the banks as the basis the committee worked out a plan whereby a money-order issued by any bank belonging to the American Bankers' Association might be cashed at any other bank belonging to the same association or at numerous correspondent banks abroad. All such orders would use the same form; these forms would be engraved, signed, distributed, and sponsored by some great bank, just as all travelers' checks of the association are drawn in the Bankers' Interest Company of New York. Being then sold at various parts they would come back to the bank first issuing them for final payment. These money-orders could be so issued as to be cashed in foreign countries, the rate of exchange being specified in the order itself. They would differ from travelers' checks in that they would be issued in any denomination and would require no identification. The charge for orders would be made lower than present charge for post office money-orders.

A metropolitan bank could only be induced to undertake the plan if assured of a considerable volume of business under it. To offset the expense involved the central agent bank would have the use of 2 per cent. interest of the deposits of \$1000 by each of the banks entering the scheme. Moreover, whenever a bank sold an order it would be required to transmit the proceeds to this agent bank, which would enjoy the use of it until the order came back for cancellation.

If adopted it would result in competition with the United States and with express companies, neither of which would at once retire from the field. Since little profit could be expected from the plan at best this competition might prevent its adoption.

GUARANTEE OF DEPOSITS. In 1910 various suits had been begun in the States of Oklahoma,

Kansas, and Nebraska to test the constitutionality of the laws in those States, guaranteeing the deposits of State banks. The Oklahoma and Nebraska laws are compulsory on all State banks, while that of Kansas is optional. In all cases the principal plea against the constitutionality of the laws was based on the fourteenth amendment which prohibits the taking of private property without due process of law. In all of these cases the lower courts had upheld the constitutionality of the laws; and in all cases they had been appealed to the United States Supreme Court where they were decided the first week of January. The principal opinion of the Supreme Court was rendered in the case of the *Noble State Bank v. C. N. Haskell et al.*, which came from the Supreme Court of Oklahoma. This bank had resisted the efforts of the State Bank Board to collect the assessments to provide the guarantee fund. The bank claimed that it was solvent and did not need the aid of the guarantee fund and could not be called upon to aid in securing the depositors of other banks under the fourteenth amendment. The State Supreme Court dismissed the case.

The United States Supreme Court upheld the Oklahoma Court on the ground that the fourteenth amendment cannot wisely be pushed to its logical limit. It held that the decision of the lower court that the assessments were the taking of private property without due compensation was invalid, since the court had already declared that a comparatively insignificant portion of private property for private use is justified when an ulterior public advantage is served. Thereby the protection of bank deposits might, in the opinion of the court, be within the police powers, which extend to all great public needs. The giving of priority of claim to the depositors is similarly justified as incidental to the public safety or welfare which the legislature sought to insure by the guarantee law. Similar grounds were taken in the other cases.

BAPTISTS. The total number of Baptists in all branches of the denomination in 1911, according to the figures prepared by Dr. H. K. Carroll and printed in the *Christian Advocate*, was 5,534,565. This gives the Baptists third rank among the religious denominations in the United States, being surpassed only by the Roman Catholics and the Methodists. The same relative rank was held in 1890, when the communicants numbered 3,717,969. According to Dr. Carroll's figures, the regular Baptists, North, numbered 1,211,426; regular Baptists, South, 2,304,724; regular Baptists, colored, 1,799,222. In addition to these larger divisions of the denomination, there are the following smaller branches, with the number of communicants in 1910: Primitive Baptists, 102,311; Seventh Day Baptists, 8119; General Baptists, 33,600; Separate Baptists, 5180; United Baptists, 13,698; Baptist Church of Christ, 6416; Old Two-Seed-in-the-Spirit Predestinarian Baptists, 741; Church of God and Saints of Christ, 1823. The regular Baptists in the United States were divided into the Northern and Southern Baptist conventions in the year 1910-11. These conventions are, in general, bodies formed to associate and combine the different societies of the churches for more economical administration of the work of these bodies. The Northern Baptist conven-

tion held its annual meeting in Philadelphia in June, 1911. The gross budget of the societies making up the Northern Baptist denomination for the year 1910 was 2,240,462. The societies included are the American Baptist Foreign Missionary Society, the Women's Baptist Foreign Missionary Society, the Women's Baptist Foreign Missionary Society of the West, American Baptist Home Mission Society, Women's American Baptist Home Mission Society, and the American Baptist Publication Society. The Southern Baptist Missionary convention held its anniversary at Jacksonville, Fla., beginning May 11, 1911. The societies under the control of this convention include Foreign Mission Board, Home Mission Board, and Sunday School Board.

The Sunday schools under the auspices of the denomination in 1911 numbered 34,302, with 256,605 officers and teachers, and 2,603,387 scholars. There were 49,753 churches and 35,368 ordained ministers. The total value of church property was \$138,675,356. Contributions for home missions amounted to \$835,741; foreign missions, \$1,057,418; Bible and publication work, \$100,883; education, \$411,511; miscellaneous expenses, \$1,700,251, a total of \$25,978,911 contributed for all branches of work.

The denomination maintains missions in nearly all the foreign countries in the world in which Christian missions are carried on, and maintains ten theological seminaries; under its auspices are 93 universities and colleges, with 81 academies, seminaries, institutes, and training schools.

Efforts have been on foot for several years to bring about a union between the Baptist denomination and the Free-Will Baptists. Practical success has now been attained. (See BAPTISTS, FREE.)

Two important gatherings were held by the denomination from June 13 to June 25 in Philadelphia. These were the meeting of the Northern Baptist convention and that of the Baptist World Alliance. The Northern Baptist convention, while it has no legislative power, has succeeded in the last four years in becoming an instrument for the expression of the common feeling and purposes of the churches of the denomination. It is the local instrument for bringing into coöperation the missionary, educational, and philanthropic agencies of the denomination. The Social Service commission of the convention presented a programme of social service which was enthusiastically adopted. This resolution included the following points:

Equal rights and complete justice for all men in all stations of life; the right of workers to some protection against the hardships resulting from swift industrial changes; the principles of conciliation and arbitration in industrial dissensions; the protection of workers from dangerous machinery, occupational diseases, and mining disasters; the abolition of child labor and the protection of children from exploitation in industry and from work that is degrading, dwarfing and morally unwholesome; such regulation of the hours of labor for women as shall safeguard the physical and moral health of the community; the suppression of the sweating system; a gradual and reasonable reduction of the hours of labor to the lowest practicable, and that degree of leisure for all which is a condition of the highest life; a release from employment one day in seven, and a wage based not

on a seven-day week, but on a six-day week; a living wage as the minimum in every industry and the highest wage that the industry can afford; the most equitable distribution of the products of industry that can ultimately be devised; suitable provision for the old age of workers, and for those incapacitated by injury in industry; the control of the natural resources of the earth in the interests of all the people; the gaining of wealth by Christian methods and principles, and the holding of wealth as a social trust; the discouragement of an immoderate desire for wealth and the exaltation of man as the end and standard of industrial activity; and the abatement of poverty.

After the close of the convention, representatives of 8,000,000 Baptists from all over the world met in the gathering of the Baptist World Alliance. The president was Dr. John Clifford of the Baptist church of England. An interesting feature of the meetings was the presence of a large delegation of Baptists from Russia and other parts of eastern Europe. There was reported a great increase in the Baptist influence among these people. The alliance has provided for them a trained and equipped ministry, and steps have been taken for the establishment of a great central European Baptist theological seminary. A movement was started at the meeting of the alliance for the affiliation of Baptist young people of the entire world.

BAPTISTS, FREE, also called **FREE WILL BAPTISTS**. A religious denomination founded by Benjamin Randall in 1780, when a church was established at Durham, N. H., after the founder had left the regular Baptist denomination because of his disbelief in the doctrine of election. The denomination is strongest in New England, but has a considerable strength in the West. According to the religious census of the United States, taken in 1906 and published in 1910, the total number of communicants in that year was 81,359, with 1111 church edifices and 1160 ministers. In 1911 the communicants numbered 70,880, the churches 1112, and the ministers 1186. The denomination has always taken advanced positions on slavery, temperance and Christian unity. In 1911, consequent upon negotiations which had been in progress since 1907, the Free Baptists transferred to the American Baptist Foreign Missionary Society and the American Baptist Home Missionary Society, as their agents for missionary activities, their missionary fields, functions, and funds, and entered upon a movement for union, which it is expected will ultimately result in the complete union of the two denominations. This movement rests upon a platform known as the "basis of union," which formulates no creed, but recognizes the two peoples as "substantially one," and leaves differences "where the New Testament leaves them; to the teachings of the Scriptures under the guidance of the Holy Spirit." The denomination maintains several colleges, among them Bates College at Lewiston, Me.; Rio Grande College at Rio Grande, Ohio; Storer College at Harper's Ferry, W. Va.; and Hillsdale College at Hillsdale, Mich. In connection with the latter institution, a theological seminary is maintained. The official organ of the denomination, *The Morning Star*, founded in 1826, was consolidated with the *Watchman* of Boston, October 1, 1911. Professor Alfred William Anthony, D. D., of Lewiston, Me., formerly of Bates College, is corresponding secretary and

treasurer of the General Conference, and at the same time special joint secretary of the American Baptist Foreign Mission, Home Mission, and Publication societies.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA. An organization which combines all the young people's societies in Baptist churches in the United States and Canada for the purpose of carrying on educational work and the training of young people for efficiency in Christian work. It was organized in 1891 in Chicago. It has its headquarters in Philadelphia and Chicago. The organization publishes two monthly magazines, *Service* for the senior department, and *Our Junior* for the junior department. These two are now published by the American Baptist Publication Society in Philadelphia. The membership of the union in 1911 was something over 600,000. It is international in its scope, including all the provinces of Canada as well as the United States. The following were the international officers in 1911: President, W. J. Williamson, D. D., St. Louis, Mo.; vice-presidents, George W. Truett, D. D., Dallas, Tex., A. H. Vautier, Philadelphia, Pa., Rev. H. H. Bingham, London, Ont.; general secretary, William B. Chalmers, Philadelphia; recording secretary, Rev. H. W. Reed, Rock Island, Ill.; treasurer, H. D. Osgood, Chicago, Ill. The union holds meetings annually.

BAR ASSOCIATION, AMERICAN. The American Bar Association is an organization which includes in its membership nearly all the leading lawyers of the United States. It was founded in 1878. Its membership is about 5000. Annual meetings are held for the purpose of discussing matters of interest to the profession. The meeting for 1911 was held in Boston on August 30. The retiring president, Edgar H. Farrar, delivered the annual address. He discussed in general the legislation passed by Congress and the different States. His address included a short review of the corporation laws of the country and strong recommendations that they be amended in many important particulars. He denounced the issuance of fictitious or watered stock as the great American national disgrace, declaring that this was made possible by those corporation laws which provided no governmental supervision over the organization of corporations which provided no part of the capital stock to be paid in money, and which permit issuance of stock at the pleasure of the organizers and directors for property, labor, and services, at such valuation as they may choose to place on them.

Committees of the Bar Association are engaged in the study of the forms of judicial procedure and uniform divorce laws.

The officers chosen for 1912 were: President, Stephen S. Gregory, Chicago; secretary, George S. Whitelock, Baltimore; treasurer, Frederick E. Wadhams, Albany, N. Y. The next meeting of the association will be held in August, 1912.

BARBADOS. An island of the West Indies; a British colony. Area, 166 square miles. Population (1901), 195,588; estimated 1909, 194,500. Capital, Bridgetown, with an estimated population (1909) of about 35,000; Speights-town has 1500. Births (1909), 6163; deaths, 4142. Primary schools (1909), 167, with 15,946 pupils. There are secondary schools. Area under sugar-cane (1909), 35,000 acres; yield, about 17,997 hogsheads and 69,036 puncheons of molasses. Cotton acreage (1909), 4121; yield,

818,917 pounds. Sugar mills, 388; rum distilleries, 5. The fishing industry employs 250 boats, and the annual catch is valued at £17,000. Imports (1910-11), £1,345,194; exports, £1,088,830; revenue, £213,297; expenditure £211,949; debt, £422,900. Miles of railway (private), 28. Governor (1911), Sir Leslie Probyn.

BARBUDA. See ANTIGUA.

BARCA. See TRIPOLI.

BARLEY. As reported by the International Institute of Agriculture, the area devoted to barley in 1911 in twenty-one countries adhering to the institute was 98.8 per cent. of the area grown in 1910, and the production was 99.9 per cent. of the crop of the previous year, which amounted to 1,366,719,000 bushels. The production for twenty-nine countries in 1910 was given by the United States Department of Agriculture at 1,377,580,000 bushels. Drought caused a marked reduction in yield in Russia, Rumania, and the United States, amounting to 11.5 per cent., 11.7 per cent., and 7.8 per cent., based on the crops of 1910 for the three countries, respectively. Russia, the leading barley growing country of the world, produced in 1911 426,190,000 bushels in Europe, and 10,775,000 bushels in Asia. The United States ranked next with 160,240,000 bushels, followed by Germany with 149,290,000 bushels; Japan with 94,668,000 bushels; Spain with 89,940,000 bushels; Hungary, including Croatia and Slavonia, 76,115,000 bushels, and Austria with 74,529,000 bushels. A more complete list of countries and their yields is given under AGRICULTURE. The area devoted to barley in the United States in 1911 was 7,627,000 acres. In 1910 this country produced 173,832,000 bushels on 7,743,000 acres. The average yield per acre in 1910 and 1911 was 22.5 and 21 bushels, respectively. The farm value per bushel on December 1, 1911, was 86.9 cents, which is the highest since 1868, when it was \$1.09. The total value of the crop on this basis was \$139,182,000, which is by far the highest total value ever obtained. In 1910 the total value was \$100,426,000, which was exceeded but once, when in 1907 the value reached \$102,290,000. Among thirty-four States reporting barley yields, the leading ones were as follows: California 40,600,000 bushels, Minnesota 28,025,000 bushels, Wisconsin 20,910,000 bushels, North Dakota 20,475,000 bushels, and Iowa 10,950,000 bushels. The highest average acre yield for any State in 1911, 43 bushels, is recorded for Utah. Numerous lines of breeding and other investigational work were carried on with this crop during the past year at home and abroad. Among the results secured in the United States may be mentioned that irrigation experiments in California gave large increases in yield, with relatively small amounts of irrigation water. It was also found in California that plowing twenty inches deep under the average moisture conditions gives a marked increase in yield as compared with shallow plowing. Experiments by the United States Department of Agriculture in bleaching barley with sulphur, showed that the process tended to increase the moisture content and to decrease the weight per bushel slightly, while the germination was very perceptibly reduced.

BAROTSELAND. See RHODESIA.

BARR, CHARLES. A Scotch yachting expert, died January 24, 1911. He was born at Gour-

ock, near Glasgow, in 1864. He was a brother of the late John Barr, who was, in his time, the most successful racing captain of the British Isles and later continued his successes in America. Charles Barr received his first training as a navigator in sailing small craft on an estuary of the Clyde River. In 1887 he went with his brother as one of the crew to sail the *Thistle*, the Scotch challenger for the America's cup. He came to the United States a few years later, bringing over the 40-foot schooner *Minerva*, which he sailed, gaining many victories. He settled at Marblehead, Mass., and became one of the most skillful yachting navigators in American waters. In 1893 he sailed the *Navahoe* in English waters, but she was not a success and he returned to the United States in time to assist his brother who was sailing the *Jubilee* for General Charles J. Paine. In 1899 he was selected to command the *Columbia*, the vessel chosen to defend the America's cup against the *Shamrock I*. In this she was successful and two years later Captain Barr again commanded her. His third series of races for the America's cup was in 1903, when the *Reliance* was built to meet the *Shamrock II*. Captain Barr carried her through the season without a defeat. In 1905 he sailed the *Atlantic* across the ocean in the race for the Kaiser's cup and won. In the summer of 1910 he took the *Westward* across the ocean to Kiel and Cowes. He won every race in which he started except one. Among the yachts that were sailed by Captain Barr were the *Oweene*, *Wasp*, *Colonia*, *Mincola*, and the *Crusader II*. These yachts were all successful.

BARRIE, J. M. See LITERATURE, ENGLISH AND AMERICAN.

BASCOM, JOHN. An American educator, died October 3, 1911. He was born at Genoa, N. Y., in 1827 and graduated from Williams College in 1849. He studied theology at the Andover Theological Seminary, graduating in 1855. In the same year he became professor of rhetoric at Williams College, holding this chair until 1874, when he was chosen president of the University of Wisconsin. Here he remained until 1887, when he resigned and was appointed lecturer on sociology in Williams College in the same year. He remained in that chair until 1891, when he was appointed professor of political science. He again served as lecturer on sociology from 1901 to 1903, when he was made professor emeritus of political economy. Dr. Bascom's influence in the upbuilding of the University of Wisconsin was very great. His unusual personality left a strong impress on those with whom he came in contact, both within and without the confines of the college. For many years he lived in semi-retirement at Williams-town, acting as adviser and friend to the students of Williams College. He was the author of *Political Economy* (1859); *Aesthetics* (1862); *Philosophy of Rhetoric* (1865); *Principles of Psychology* (1869); *Ethics* (1879); *Natural Theology* (1880); *Problems in Philosophy* (1885); *Sociology* (1887); *The New Theology* (1891); *Social Theory* (1895); *The Growth of Nationality in the United States* (1889); and *God and his Goodness* (1901).

BASEBALL. The season of 1911 was notable for the interest taken by the public in the world's championship series played between the Philadelphia team, winner of the American

League pennant, and the New York team, winner of the National League pennant. The total attendance at the six games was 179,851, and the receipts aggregated \$342,364.50. The best previous record was in 1909 when 145,807 persons paid \$188,302.50 to witness seven games between the Pittsburgh Nationals and the Detroit Americans.

For the second year in succession the world's championship was won by the Philadelphia Americans, familiarly known as the Athletics, who captured four games of the series, as against two won by the New York Giants. The pitching strength of the Athletics combined with the batting of John F. Baker, their third baseman, who on two critical occasions for his team knocked home runs, accounted for the Athletics' victory. The scores of the games follow: New York 2, Philadelphia 1; Philadelphia 3, New York 1; Philadelphia 3, New York 2; Philadelphia 4, New York 2; New York 4, Philadelphia 3, and Philadelphia 13, New York 2.

The pennant race in the American League started in a fashion to indicate that Detroit, the winner in 1909, would have a walkover. As the season continued, however, the long lead gained in the early weeks by Detroit was overcome, and the Athletics captured the flag with 101 victories and 50 defeats. Detroit finished second with 89 victories and 65 defeats. The standing of the other clubs follows: Cleveland won 80, lost 73; Chicago won 77, lost 74; Boston won 78, lost 75; New York won 76, lost 76; Washington won 64, lost 90; St. Louis won 45, lost 107. The leading pitcher of the league was Charles Bender of the Athletics, and the leading batter was Tyrus Cobb of the Detroit team, who finished the season with the wonderful average of .420.

The race in the National League was much more exciting than the one in the junior organization, the outcome being in doubt until the final weeks of the season, when the Giants forged to the front. The New Yorkers won 99 games and lost 54. Chicago, the 1910 pennant winner, was second with 92 victories and 62 defeats. The standing of the other clubs was: Pittsburgh won 85, lost 69; Philadelphia won 79, lost 73; St. Louis won 75, lost 74; Cincinnati won 70, lost 83; Brooklyn won 64, lost 86; Boston won 44, lost 107. The leading pitcher of the league was Marquard of the Giants, and the leading batter, Wagner of Pittsburgh. After the world's series the Giants visited Cuba, winning 9 out of 12 games with the principal clubs of the island. This was the first team from the States to win a series with the Cubans.

The pennant winners in the more important minor leagues in 1911 were: Eastern League (now International League), Rochester; American Association, Minneapolis; Southern League, New Orleans; Western League, Denver; New York State League, Wilkes-Barre; Connecticut League, Springfield; New England League, Lowell.

Princeton for the second successive year made the best showing of the college baseball teams, winning 18 games and losing 8. Its claim to the championship also was strengthened by its victories in the series with Harvard and Yale.

The scores in Princeton's principal games were: Princeton 5, Yale 2; Princeton 3, Yale 6; Princeton 1, Yale 0; Princeton 5, Harvard 0; Princeton 2, Pennsylvania 7, and Princeton 10, Pennsylvania 8; Princeton 5, Michigan 4;

Princeton 4, Lafayette 2; Princeton 9, Cornell 9; Princeton 3, Cornell 0; Princeton 2, Brown 4; Princeton 6, Brown 2; Princeton 2, Georgetown 2.

Harvard defeated Amherst 9-2, Brown 11-1, Pennsylvania 2-1, Holy Cross 19-5, Williams 5-3, Yale 8-2 and 4-1, and was defeated by Annapolis 4-5, Princeton, 0-5, Holy Cross 1-4, Dartmouth 5-10, and Brown 2-7. Yale's principal victories were over Princeton 6-3, Fordham 7-2, Pennsylvania 2-1, Holy Cross 11-7 and 7-3, Virginia 6-0, and Brown 4-1. Yale lost to Georgetown 2-8, Williams 1-2, Pennsylvania 1-3, Brown 1-5, Amherst 0-2, Cornell 5-7, Princeton 2-5 and 0-1, and Harvard 2-8 and 1-4. Brown won victories over Wesleyan 5-0, Princeton 4-2, Virginia 3-0, Yale 5-1, Pennsylvania 4-2, Michigan 2-1, Amherst 6-0, and Harvard 7-2. Brown was defeated by West Point 6-7, Princeton 2-6, Yale 1-4, Harvard 1-11, and Amherst 1-2. Pennsylvania defeated Annapolis 17-3, Lehigh 3-0, Virginia 8-0 and 10-0, Fordham 5-1, Yale 3-1, Holy Cross 3-1, Princeton 7-2, Dartmouth 10-7, Cornell 8-6, and was defeated by Georgetown 0-2, Yale 1-2, Princeton 8-10, Cornell 1-2, 5-6, and 2-4, Lafayette 0-5, Harvard 1-2, and Holy Cross 0-1.

An important change in the scoring rules was made in 1908 by the National Commission of the two major leagues. This provided that a batter should be credited with a sacrifice hit on a fly to the out field scoring a runner from third base.

BASKETBALL. The Intercollegiate Basketball League which disbanded in 1910 was revived for the 1911 season. Columbia won the championship with 7 victories and 1 defeat. Pennsylvania finished second, winning 5 games and losing 3. The standing of the other teams in the league was: Cornell won 4, lost 4; Yale won 3, lost 5; and Princeton won 1, lost 7. Columbia defeated Cornell 20-16 and 33-17, Princeton 36-13 and 23-12, Yale 25-10 and 20-10, and Pennsylvania 17-15. Columbia's only defeat was at the hands of Pennsylvania, the score being 18-20. Pennsylvania's other victories were over Yale 34-17, Princeton 27-19 and 15-14, and Cornell 34-24. Pennsylvania was defeated by Columbia 15-17, Yale 33-37 and Cornell 14-16. Princeton's single victory was in the second Yale game, in which the latter was defeated 36-32. The total number of points made by each team follows: Columbia 192, Pennsylvania 192, Yale 172, Cornell 165, Princeton 159. The total number of points scored against these teams was: Columbia 113, Pennsylvania 162, Cornell 190, Yale 203, Princeton 212.

The Western Conference championship series of games resulted in a tie for first place between Minnesota and Purdue, each of these teams winning 8 games and losing 4. Chicago finished second with 7 victories and 5 defeats and Illinois third with 6 victories and 5 defeats. The standing of the remaining teams in the league was Indiana won 5, lost 5, Wisconsin won 6, lost 6, Iowa won 2, lost 2, and Northwestern won 1, lost 12. Wesleyan won the New England League championship, being undefeated in four games. Williams was second with an even break. Dartmouth failed to win a game. The championship among the Southern colleges was won by the United States Naval Academy. There were no Amateur Athletic Union championships held in 1911.

BASUTOLAND. A British dependency,

northeast of the Cape of Good Hope province. Capital, Maseru, with 1300 inhabitants (200 Europeans). Area, 10,293 square miles; population (1904), 348,626. Primary schools (1909), 245; secondary, 9 (chiefly normal and industrial); nearly all are mission schools, government-aided. The territory occupies a high plateau, excellently adapted to grain and cattle-raising. The principal crops are corn, wheat, and millet. A good trade is carried on in wool and mohair, and the native-bred mountain ponies are much esteemed. There are no mining industries. Imports 1907, £238,500; 1908, £239,830; 1909, £258,994. Exports 1907, £248,500; 1908, £193,122; 1909, £349,884 (corn, 36,431,400 pounds, valued at £75,201; wheat, 12,511,000 pounds, £48,979; millet, 1,382,400 pounds, £3820; wool, 6,960,600 pounds, £139,022; mohair, 1,455,900 pounds, £49,721). A branch of the South African Railways crosses the border at Maseru. The postal and telegraph service is run in conjunction with the Cape of Good Hope service. A government telephone connects the districts. Revenue 1909-10, £119,974; expenditure, £127,437. There is no debt. Letsie is the paramount chief. The territory is administered by the governor-general for the Union of South Africa, through a resident-commissioner (1911, Sir Herbert Cecil Sloyer).

BATCHELLER, IRVING. See LITERATURE, ENGLISH AND AMERICAN.

BATCHELOR, EGBERTON LEE. 'An Australian public official, died October 7, 1911. He was born in Adelaide in 1865 and was educated in the public schools of that city. For a time he taught school, but soon became an apprentice in the Government Locomotive Works, and became active in trade unionism. He was elected to the South Australian Parliament at the general election in 1893 and was chosen leader of the Labor party of the state. From 1899 to 1901 he was minister of education and agriculture, but resigned office to stand for election to the first Federal Parliament, to which he was elected. He was appointed minister for home affairs in 1904, serving from April to August, and minister of external affairs in the first Fisher cabinet, serving from November, 1908, to June, 1909, and in the second Fisher cabinet from April, 1910, until the time of his death.

BATTLESHIPS. GREAT BRITAIN. At the end of 1911 the British dreadnought *Orion* is the most powerful battleship afloat, ready for service. There are four vessels of her class, *Orion*, *Monarch* (launched March 30, 1911), *Conqueror* (launched May 1, 1911), and the *Thunderer* (launched February 1, 1911.) The principal characteristics of the *Orion* are: Displacement 22,680 tons; length 545 feet; beam 88½ feet; horsepower 27,000; Parsons turbines; four screws; speed 21 knots; 18 Yarrow boilers in three groups, fired by oil fuel as well as coal; total fuel supply, 3700 tons, including 1000 tons of oil; armament, ten 13.5-inch, 45 cal. guns, mounted in five 2-gun turrets, all on the centre line; 20 4-inch; three torpedo tubes, 21-inch; main armor belt 12 inches. Two of the five turrets are mounted on the forecastle, the after

one being raised to permit its guns to be fired over the other. The third is amidships, abaft the superstructure carrying the single tripod mast and pair of funnels. This turret is on the same level as the upper deck and the ends of the superstructure have been cut away to give a maximum arc of train on each beam. Further aft is a raised superstructure carrying some of the four-inch guns of the anti-torpedo armament, a pair of boat cranes, and a second conning tower. The two remaining turrets are superposed, the higher being on a level with the bow turret, with a very wide arc of train. The ten 14-inch guns of the American dreadnoughts *Texas* and *New York* will be mounted on this plan. Although, in theory, two of these turrets can fire over those below them, it is doubtful if they will ever do so in practice, even in the case of the lighter 12-inch turrets of the *Nep-tune*. During the trials of the *Minas Geraes* and the *Neptune*, it was proved that living organisms would not suffer to any great extent from the blast of such firing, but it is doubtful if this would be so with 13.5-inch guns firing instead of 12-inch. This system of mounting ten guns is a great improvement on the two systems hitherto adopted in British dreadnoughts; it is thought to be superior to that adopted for the American vessels of the *Dela-ware* and *Utah* classes, in which two of the turrets are rather cramped. In spite of the increased weight of the heavy armament, and the great increase in length of the *Orion*, the difference in displacement, compared with the *Nep-tune*, is not remarkable. The *Neptune*, with her ten 12-inch guns, has a displacement of 19,900 tons, and a length between perpendiculars of 510 feet; the *Orion* is heavier by 2780 tons, with a length of 545 feet between perpendiculars. The 13.5-inch shell weighs 1250 pounds; the 12-inch shell 850 pounds; while the muzzle energy equals about 70,000 foot-tons, as against the 48,000 foot-tons of the 12-inch. On the *Orion's* trials her big-gun firing was successful, but she considerably damaged her anti-torpedo armament; and a different system of mounting is deemed imperative. On her thirty hours trial at 18,500 horsepower, her engines developed over the indicated power, and she made 19.3 knots. On her eight hours full power trial, it is said that she developed slightly less horsepower and speed than anticipated. It is claimed that there was no vibration at all.

Great Britain's twenty-first dreadnought, the *King George V.*, an improved *Orion*, and the seventh ship to carry 13.5-inch guns, was launched on October 9, 1911; she is the first vessel of the 1910-11 programme to take the water. In essentials, she is a sister ship of the *Orion*, but about fifteen feet longer, and displacing about 1500 tons more. Her anti-torpedo guns will be behind armor.

The British battle cruiser *Lion*, 26,350 tons, is under trial; and her sister ship, the *Princess Royal*, was launched on April 29, 1911; and the *Queen Mary*, 26,850 tons, is building. These ships will each carry eight 13.5-inch guns in four centre-line 9-inch turrets, the second from forward being superposed; the anti-torpedo armament is sixteen 4-inch guns. The *Princess Royal* is 700 feet long over all, with a beam of 88½ feet; draft 27½ feet; Parsons turbines, 70,000-horsepower; speed twenty-eight knots; to be completed by March 31, 1912.

AUSTRALIA. The present Commonwealth pro-

gramme is to provide the unit agreed upon at the Defense Congress of 1909, one armored cruiser, the *Australia* (*Indefatigable* class), three protected cruisers of an improved *Bristol* type, six destroyers of the river class, and three submarines. The contracts for an armored cruiser, two protected cruisers, and two submarines have been placed in Great Britain, and contracts have been concluded with the government of New South Wales for the construction at Sydney of one protected cruiser, to be named the *Brisbane*, and three destroyers. The unit will be completed in 1912-13. The *Australia* is due for commission in September, 1912. The *Sydney* and *Melbourne* will be completed in August, 1912. Displacement 5400 tons; horsepower 25,000; speed 25½ knots; armament, eight 6-inch guns; two torpedo tubes.

NEW ZEALAND. The first warship given to the imperial navy by any of the oversea dominions, the *New Zealand*, launched July 1, 1911, is a sister ship of the *Australia* (*Indefatigable* class) which John Brown & Co. are building for the Australian government. The *New Zealand* is due for commission in September, 1912.

GERMANY. By the commissioning in August of the *Helgoland*, Germany now possesses seven dreadnoughts. The *Helgoland* class (*Helgoland*, *Ostfriesland*, *Thüringen*, and the unfinished *Oldenburg*) has a displacement of 22,800 tons; length 546 feet; beam 93½ feet; draft 28 feet, 10¾ inches; triple expansion reciprocating engines; designed speed 20.5 knots; speed attained 22 knots; armament twelve 12-inch fourteen 5.9-inch, and fourteen 3.4-inch guns. The heavy guns are mounted in six 2-gun turrets, one on the centre line forward, one on the centre line aft, and four in broadside; therefore only eight guns bear abeam. This arrangement was also adopted in the older *Rheinland*, *Posen*, *Nassau*, and *Westfalen*, each armed with twelve 11-inch guns. Although the *Helgoland* class carries as many heavy guns as the American *Wyoming*, the latter is 50 per cent. superior on the broadside.

The German battle cruiser *Moltke*, 23,000 tons, designed speed 25.5 knots, 50,000-horsepower, has held her trials, making 29½ knots, with Parsons turbines. She is an improved *Von der Tann* (19,000 tons, eight 11-inch guns in four 2-gun turrets, two on the centre line and two in echelon). Her armament is ten 11-inch, twelve 5.9-inch, and twelve 3.4-inch guns, the arrangement being generally the same as in the *Von der Tann*, with an additional turret superposed forward of the aftermast. Length 613 feet; beam 96 feet, 9 inches; draft 27 feet; four torpedo tubes; normal coal supply 1000 tons; total supply 3100 tons. The disposition is almost the same as in the British *Hercules* and *Colossus*, six guns bearing ahead, eight astern, and ten on either beam. The *Goeben*, sister ship of the *Moltke*, was launched on March 28, 1911.

UNITED STATES. The 21,825-ton, 20¾-knot dreadnoughts, *Florida* and *Utah*, have been completed and are in commission; they are in essentials sister ships to the *Delaware* and *North Dakota*, each carrying ten 12-inch guns in five turrets on the centre line. The *Wyoming* and *Arkansas*, full-load displacement 27,243 tons, are over three-quarters completed. Their characteristics are: Length 562 over all; 554 between perpendiculars; beam 93 feet, 2½ inches, on load water line; mean draft 28 feet, 6 inches;

normal displacement with two-thirds supply of fuel and stores, and full supply of ammunition, 26,000 tons; estimated trial displacement, 26,000 tons; Parsons turbines, four shafts; estimated 28,000 shaft horsepower, giving 20½ knots; bunker capacity of 2500 tons, with 400 tons of oil fuel in addition; boilers, Babcock and Wilcox water tube type. The armament consists of twelve 12-inch guns, in six 2-gun turrets on the centre line; and twenty-one 5-inch anti-torpedo guns; four 3-pounders, two 1-pounders, semi-automatic guns; two 3-inch field pieces and two 30-calibre machine guns; two 21-inch submerged torpedo tubes.

The battleships *New York* and *Texas* (normal displacement 27,000 tons) will be the first ships to mount the new 14-inch guns, each ship carrying ten in five 2-gun turrets on the centre line. The *New York* is almost one-quarter, and the *Texas*, almost one-half completed. The *Nevada* and *Oklahoma*, authorized, will each carry ten 14-inch guns in four turrets, on the centre line, two triple-gun and two 2-gun turrets. The front plates of the two 3-gun turrets will be eighteen inches thick and, as far as is known, the heaviest armor plate afloat. The front plates of the two 2-gun turrets will be sixteen inches thick. The side armor will be thirteen inches thick, as compared with eleven inches on the *New York* and *Texas*. They will each have only one smoke pipe; and will be oil burners.

FRANCE. The 23,500-ton battleships *Jean Bart* and *Courbet* were launched on September 22, 1911, and September 23, 1911, respectively. Each carries twelve 12-inch 45-calibre guns, in six 2-gun turrets, four on the centre line (the two inside ones being superposed), and two in broadsides. Main armor belt 10.7 inches; speed 21 knots. Their sister ships, *France* and *Paris*, have been commenced.

JAPAN. The 20,800-ton dreadnoughts *Kawachi* and *Settsu* were launched on October 15, 1910, and March 30, 1911, respectively. They are armed with twelve 12-inch guns in six 2-gun turrets, arranged as in the German *Helgoland*. A new battleship is building at Kure, rumored to have a displacement of over 25,000 tons, and to carry twelve 13.5-inch guns. A turbine-driven battle cruiser, *Kongo*, 27,500 tons, is building at Barrow. Three others of the same class are building in Japan; the *Kirishima* at the Mitsubishi yard at Nagasaki; the *Haruna* at the Kawasaki yard, Kobe; and the *Hiei* at the Yokosuka yard. Their armament is a secret.

ITALY. The *Conte di Cavour*, 22,000 tons, Italy's second dreadnought, was launched on August 10, 1911. In design she is unique, carrying thirteen 12-inch guns. Her big guns are mounted in five turrets of which two are raised to fire over the forward and after ones respectively, and the fifth is amidships between the masts. The three lower turrets are triple-gun turrets; and the raised ones twin-gun turrets. All guns can be trained on either beam; and fire axially ahead or astern, giving a broadside of 11,050 pounds and 4250 pounds, ahead and astern. The anti-torpedo battery is carried along the upper deck, and consists of eighteen 4.7-inch guns; while a tertiary armament of fourteen 14-pounders is distributed over the superstructures and turret tops. An original method of spacing the 4.7-inch guns has been adopted to provide for a heavy end-on fire. The ship's side is deeply recessed in a series of steps for-

UNITED STATES BATTLESHIP "FLORIDA"
A DREADNOUGHT OF 21,825 TONS PUT INTO COMMISSION 1911

ward and abaft the two centre 4.7-inch ports, so as to permit the mounting of four guns forward and three aft per broadside. The armor protection is light for a ship of her size; her waterline belt is probably like that of the *Dante Alighieri*, 10-inch amidships with 6-inch forward and 4-inch aft; speed 22½ knots; 24,000-horsepower; turbines. British "Bullivant" torpedo nets will be stowed along the battery deck. Her sisters, the *Leonardo da Vinci* and the *Giulio Cesare*, were launched October 14, 1911, and October 15, 1911, respectively. All these ships are to be completed by 1913. On paper, the *Carour* is, with the exception of the British *Orion*, the most powerful ship afloat.

RUSSIA. The 23,000-ton battleship *Sevastopol* (launched June 29), the *Poltava* (launched July 10), the *Petropavlovsk* (launched September 9), and the *Gangut* (launched October 7), have these characteristics: Length 590½ feet; beam 87 feet; draft 27 feet, 3 inches; engines 42,000-horsepower; speed 23 knots. Total coal capacity 3000 tons; capacity of liquid fuel 1170 tons; 4 screw turbines; 25 modified Yarrow boilers. Armament: Twelve 12-inch guns in 4 triple-gun turrets, and sixteen 4.7-inch.

AUSTRIA. The Austrian dreadnought *Viribus Unitis*, the first of a group of four of 20,000 tons each, was launched on June 24, 1911. She is 493 feet long; 91 feet beam; draft 27 feet; 3 sets of turbines aggregating 26,000 horsepower, designed to give 21 knots. The armament consists of twelve 12-inch guns in four centre-line, triple-gun turrets, two being superposed, so that six guns bear ahead and astern; twelve 6-inch, and eighteen 3.4-inch guns, and five 18-inch torpedo tubes are also to be mounted. The maximum thickness of the armor belt is 12 inches, and the total weight of armor carried is said to be 6000 tons.

ARGENTINE REPUBLIC. The Argentine Republic dreadnoughts, of 23,000 tons each, the *Rivadavia* and the *Moreno*, were launched on August 26, 1911, and September 23, 1911, respectively. The principal characteristics are: Length 585 feet over all; beam 98 feet; normal draft 27 feet; 40,000-horsepower; speed 22½ knots; steaming radius at 15 knots, 7000 miles, or 11,000 miles at 11 knots. Armament: Twelve 12-inch, 50-calibre, twelve 6-inch, and twelve 4-inch guns. The heavy guns are in six 2-gun turrets, four in the centre line and two in echelon.

BEAUX-ARTS ARCHITECTS. An association of American graduates of the *Ecole des Beaux Arts*, Paris. The system of educational work originated by the society in 1902 includes the establishment in different cities of the United States of ateliers, or schools in which instruction on architecture may be obtained. The instruction is based on that given in the *Ecole des Beaux Arts*, and many colleges and universities throughout the country avail themselves of the programme of the society used in its courses of instruction. In each city the ateliers are formed by a group of students who desire to carry on the study of architecture. A master or patron, whose work is given free, is chosen or appointed, and the atelier is supported by contributions from the students. Each year the committee on education of the society issues

a certain number of programmes which include problems to be worked out by the different ateliers. These competitions are designated "Class A" and "Class B" competitions.

During 1910-11 approximately 16,500 programmes were issued by the chairmen in the thirty-three regular competitions and the three special prize competitions conducted under the auspices of the society. These programmes were distributed in forty-five different cities in the United States and Canada. The committee passed judgment on 2356 sets of drawings and sketches submitted by students for exhibition and judgment. The society awards four prizes: The Warren Prize, offered for general excellence in planning a group of buildings; the Pupin Prize, the gift of Professor M. I. Pupin of Columbia University, offered for decorative treatment of some scientific appliance; the Goelet Prize, the gift of Mr. Robert W. Goelet, for excellence in planning a city block; and the Bacon Prize, gift of Mr. Robert Bacon, for the greatest number of honors obtained in Class A. Mr. Bacon also offers annually a Paris prize. The winner of this prize is chosen to pursue his studies in the first class in the *Ecole des Beaux Arts*, Paris, according to the regulations to this end adopted by the French minister of public instruction and fine arts. The winner of this prize receives \$250 quarterly for two years and a half, dating from his departure for Europe. The Warren Prize in 1911 was awarded to C. S. Pierpont, the Pupin Prize to J. M. Arellano, and the Bacon Prize to W. F. Burkhart, Jr.

BECHUANALAND. See **CAPE OF GOOD HOPE PROVINCE.**

BECHUANALAND PROTECTORATE. A British South African possession extending from the Malopo to the Zambesi rivers and from the Transvaal to German Southwest Africa. Area about 275,000 square miles; population (census of May 2, 1911), 125,350, of whom 1692 were whites. Serowe (17,000 inhabitants) is the capital of the Bamangwato tribe, under Khama, the native chief. The Bakhatla, Bakwena, Bangwaketse, and other tribes have their own chiefs. There are government-aided schools. The chief industries are the raising of cattle (323,911 in 1911) and agriculture. Imports (1909), £96,096; exports, £123,627 (not including the proceeds from the sale of 1900 head of cattle, about £8000.) Exports of raw gold, £55,619. The railway and telegraph lines from the Cape of Good Hope to Rhodesia traverse the protectorate. Post offices, 16. Revenue (1910-11), £52,067; expenditure, £64,791; grant-in-aid, £20,000. The tribal chiefs are directed by a resident-commissioner (1911, Lieut.-Col. F. W. Panzera), residing at Mafeking and acting under the governor-general for the Union of South Africa.

BECK, CARL. An American surgeon, died June 8, 1911. He was born at Neckargemünd, Germany, in 1856, and was educated at the Gymnasium and University of Heidelberg. He studied medicine at the University of Jena. In 1882 he removed to the United States and soon became prominent as a surgeon, and from 1886 to the time of his death was visiting surgeon at St. Mark's Hospital, of which he was president. He was also surgeon at the German Poliklinik and at the German Hospital, and professor of surgery at the New York Post Graduate Medi-

cal School. He was a member of several medical societies. He was the author of a number of books on surgical subjects, both in English and German. Among these are: *A Manual on Surgical Asepsis* (1895); *Text Book on Fractures* (1900); *Roentgen Ray Diagnosis and Therapy* (1904); *Surgical Diseases of the Chest* (1907). He was also author of a book of travels entitled *Glimpses from Latin America* (1908) and a novel in German, *Der Schwederkonrad*.

BEGAS, REINHOLD. A German sculptor, died August 10, 1911. He was born in Berlin in 1831, the son of an artist. From 1846 to 1851 he studied sculpture and in the latter year began teaching at Weimar. Two years later he was entrusted with the execution of the Schiller monument in Berlin. From that time onward for many years he developed an increasing reputation as a national decorator and was at his best when the foundation of the empire began to provide scope for the commemoration of imperial heroes. His work is everywhere seen in Berlin and in Potsdam. He was the creator of the national memorial to Emperor William I., near the royal castle in Berlin; of the Bismarck memorial in front of the Reichstag; of several of the statues in the Siegesalle; of the Humboldt memorial outside of the Berlin University buildings, and of the marble sarcophagi of Emperor and Empress Frederick in the mausoleum of Potsdam. He was directly or indirectly responsible for more German monuments than any man of his own or any other time.

BELGIAN EXPOSITION. See EXHIBITION.

BELGIUM. A constitutional monarchy of western Europe. Capital, Brussels.

AREA AND POPULATION. The area is officially given at 29,455 square kilometers (11,373 square miles). Population (1900), 6,693,548; estimated December 31, 1910, 7,516,730. Marriages in 1909, 57,126; divorces, 1039; living births, 176,431; still-births, 8269; deaths, 117,571. Immigrants (1909), 39,488 (16,090 from France, 8329 from Germany, 7133 from Holland); emigrants, 35,190 (20,025 into France, 4850 into Holland, 4432 into Germany). Population of Brussels (estimate December 31, 1910), 655,806 (with suburbs); Antwerp (exclusive of suburbs), 320,640; Liège, 174,768; Ghent, 185,149.

EDUCATION. The primary schools under state inspection numbered, in 1909, 7435 (9.98 per 10,000 inhabitants), attended by 923,386 pupils (12.39 per 100 inhabitants); teachers, 8868. Infant schools, 3050 with 268,803 pupils; adult schools (state), 4628 with 233,870; state normal schools, 54, with 4548. Amount expended on foregoing schools in 1908, 51,713,876 francs. Number of students admitted to state normal schools in 1909-10, 219. Number of students in the various state, communal, and provincial establishments for secondary education in 1909, 35,436.

The universities had (1909-10) 7625 students, as follows: Ghent, 1136; Liège, 2743; Brussels, 1236; Louvain, 2510; these figures include technical and special students. While Roman Catholicism is the state religion, entire religious liberty prevails.

AGRICULTURE. The annual agricultural census shows the area (in hectares) sown to principal

crops, the total production in metric quintals, the average production per hectare in 1909, and the total production in 1908, to have been as follows:

Crops	Ha.	Qs.	Av.	Qs. 1908
Oats	250,226	6,274,998	25.07	6,249,976
Rye	257,542	5,881,388	22.84	5,638,947
Wheat	157,765	3,974,480	25.19	3,644,904
Barley	35,404	995,909	26.03	959,922
Beets a	66,669	36,508,783	547.61	37,990,040
Beets b	58,439	15,896,662	272.02	15,599,387
Potatoes	140,163	24,591,706	175.45	22,547,030
Hay, etc.....	384,981	17,429,346

a For forage. b For sugar.

The number of horses employed for agricultural purposes was on December 31, 1908, 255,229; cattle, 1,856,833; swine, 1,116,500.

The state forests cover 25,309.74 hectares; communal, 149,671.69; public, 4,808.08; private, 309,633.91; a total of 489,423.42 hectares. The forest products are valued at about 21,653,000 francs per annum.

MINING AND METALS. The table below gives the product of the mines, furnaces, etc., in metric tons, with the value in thousands of francs, for 1909; and the value (in 1000 fr.) for 1908.

	Tons	1000 fr.	1908
Coal	23,517,550	337,906	380,579
Iron ore	199,710	1,056	993
Quarried prods	59,885	62,875
Pig iron	1,616,370	100,582	85,883
Manufactured iron..	316,990	45,653	41,584
Steel ingots	1,580,350	128,950	107,095
Steel blooms, etc..	866,080	77,398	59,209
Manufactured steel.	1,264,650	157,457	137,835
Zinc ingots	174,490	95,336	80,383
Pig-lead	40,306	13,308	12,121
Silver*	271,270†	26,758	23,349

* From lead. † Kilograms.

The coal mines in operation in 1909 (130) employed 143,051 persons; the metallic mines, 708; quarries (1570), 35,482; blast furnaces, 3874; iron works, 977; steel works, 15,990; zinc works, 7378; lead works, 1861.

OTHER INDUSTRIES. There were, in 1909, 95 sugar mills (production, 239,370 tons) and 22 refineries (110,432 tons); 131 distilleries (output, 69,704 kiloliters of alcohol at 50° G.-L.; 3379 breweries (approximate output, 1,535,375 kiloliters). The fishing vessels (1909) numbered 464 (tonnage, 8434), and the catch was valued at 6,203,810 francs.

COMMERCE. The trade, special and transit, is shown in the following table in thousands of francs:

	1908	1909	1910
Imports	2,327,433	3,704,316	4,264,961
Exports	2,506,444	2,809,723	3,407,428
Transit	2,021,035	2,290,365	2,287,212

The table below shows the value of the principal articles of special trade in thousands of francs for the year 1910:

Belgium is the third most important wheat importer in the world, ranking after Great Britain and Germany. In 1910 the wheat import amounted to 73,631,037 bushels (of 60 pounds); flour, 29,311 barrels (of 196 pounds). Her wheat production ranges from thirteen thousand to fifteen thousand bushels; and her export trade is growing, amounting in 1910 to 22,897,877 bushels of wheat and 701,563 barrels of flour.

The principal countries of origin and destination are given below for 1909 and 1910 in millions of francs:

Imports	1909	1910	Exports	1909	1910
France	563.0	747.2	Germany	729.9	881.4
Germany	494.9	576.1	France	498.5	669.1
Gr. Brit.....	457.2	516.8	Gr. Brit.....	409.2	457.6
Russia	326.2	364.1	Netherlands ..	327.9	
Netherlands ..	282.6	293.1	Argentina	90.2	128.6
Argentina	320.2	278.1	U. S.....	107.1	117.1

Australia	117.5	210.8	Russia	40.9	67.0
Rumania	112.6	204.6	Brazil	59.5	
British India..	167.7	188.4	Spain	34.5	39.2
Bel. Congo	62.1	78.7	Turkey	28.6	35.7
Chile	56.0	63.1	Brit. India... 35.2		32.0

Vessels entered (1910), 10,943, of 15,101,171 tons; cleared, 10,929, of 15,074,061. The merchant marine (December 31, 1909) included 97 steamers, of 184,261 tons; and four sailing vessels, of 3183.

COMMUNICATIONS. Total length of railways in operation in 1910, 4664 kilometers, mostly state. Gross receipts for 1909: State, 281,532,167 francs; private, 29,501,540. Expenditure, 190,540,123 and 12,923,238 francs. About 233 miles were added to the light railway systems of Belgium during the year 1911. Length of public roads, 6270 miles; navigable rivers and canals, 1360. Length of telegraph lines (1910), 7880 kilometers. Telephone wires (1909), 222,499 kilometers. Cost of operation (telegraph and telephone systems) for 1909, 13,431,132 francs; receipts, 16,290,950. Post offices (December 31, 1909), 1519. Postal rev. for the year, 37,481,624 francs; expend., 17,985,379.

FINANCE. The unit of value is the franc, worth 19.3 cents. The revenue and expenditure for successive years are shown in the following table (in 1000 francs):

	1907	1908	1909	1911*
Revenue ord....	617,808	616,986	645,107	658,725

Total	767,773	770,451	786,203

* Estimate. † Including amounts realized from loans: 1907, 88,985,000 francs; 1908, 81,605,000 francs. ‡ Exclusive of amounts realized from loans.

The 1911 budget estimate is detailed below:

Revenue	1000 fr.	Expenditure.	1000 fr.
Railways	296,200	Rys., posts, tels..	237,354
Licences	79,751	Public debt	193,251
Registration, etc.	74,703	War	59,935
Direct taxes....	70,768	Arts, etc.....	37,128
Customs	55,728	Justice	30,288
Posts, tels., etc.	47,235	Agriculture, etc..	29,372
Domains, etc....	24,888	Ind. and labor...	23,686
Repayments	8,151	Finance	22,946
Various	1,301	Other	30,388

The public debt stood, January 1, 1911, at 3,703,403,693 francs (share of the Netherlands debt at 2½ per cent., 219,959,632 francs; loans at 3 per cent., 3,483,444,061).

ARMY. During 1911 the reorganization on the basis of the law which went into effect on December 14, 1909, requiring personal service was still in progress. Such a step was rendered necessary as under former conditions it was impossible to realize either the peace strength or the war reserve. The establishment called for 42,800 men on a peace basis, and 180,000 on a war footing, this being secured by a liability for service, which, except in the exempt classes, demanded one son in each family. The required service was fifteen months for the infantry, fortress artillery, and engineers, two years in the cavalry and horse artillery, twenty-one months in the field artillery, and twelve and one-half months in the administrative service. Total service for each soldier, which included later trainings, was to be twenty months in the infantry, thirty-six months in the horse artillery and cavalry, twenty-eight months in the field artillery and army-service corps, twenty-two months in the fortress and special artillery companies, and twenty-four months in the administrative service. The minister of war reported that on May 31, 1911, both the peace and the war strength required had been attained, and that with thirteen classes of the militia there was available a total strength of 178,436, and including officers and gendarmes 186,846.

The reorganization of the artillery contemplated under the rules effective October 1, 1910, had taken place, and the field artillery was organized into four brigades each of two regiments of six field batteries, while a reserve of twelve field batteries and ammunition columns was formed. There were also four horse batteries.

The organization of the active army, exclusive of the artillery just described, includes for the cavalry two regiments of chasseurs, two

of guides, four of lancers, each composed of four active squadrons, and one in reserve. In addition, there were the mounted troops of the gendarmerie, about 1700 men. The engineer troops comprised one regiment of three battalions, a reserve battalion, and five companies of technical troops. The infantry included fourteen regiments of the line, and one regiment of grenadiers organized into four battalions of four companies each, three battalions for active, and one a reserve battalion. There were further a regiment of carabineers of six battalions, four active and two reserve, and three regiments of chasseurs-à-pied. To the military forces can be added the civil or national guard, which comprised 45,000 men "active," and 100,000 non-active, in times of peace under the control of the minister of the interior.

The war budget for 1912 amounted to 64,843,940 francs, an increase of 4,908,500 francs over the budget of 1911. The effective force provided for in the 1912 budget was 3540 officers, 41,020 men and 2061 civil employees, and included 10,200 horses, 2043 of which were officers', and 8157 for the troops. The budget for the gendarmerie for 1912 was 10,330,820 francs, an increase of 1,171,360 francs. The effective force provided for in this budget consisted of thirteen companies made up of seventy-nine officers and 3648 men, of whom 1745 were mounted. The budget provided further 3,000,000 francs for the armament of the new works at Antwerp, and 2,000,000 for rapid-fire guns for six batteries essential to the defense of that city.

GOVERNMENT. The king in 1911 was Albert, born 1875, a son of the late Prince Philippe de Saxe-Coburg and Gotha and of Flanders; married (1900) to Princess Elizabeth of Bavaria; succeeded his uncle, Leopold II., December 17, 1909. Heir-apparent, Prince Leopold, born November 3, 1901. The ministry, as constituted July 13, 1911, was made up of the following members: Premier and Minister of Railways, Posts, and Telegraphs, Charles (Baron) de Broqueville; Justice, H. Carton de Wiart; Foreign Affairs, J. Davignon; Interior, Paul Berruyer; Arts and Sciences, P. Poulet; Finance, M. Levie; Agriculture and Public Works, A. van de Vyvere; Industry and Labor, Armand Hubert; War, Lieut.-Gen. J. Hellebaut; Colonies, J. Renkin.

HISTORY

THE QUESTION OF ELECTORAL REFORM. Early in the year the subject of electoral reform was discussed in the Chamber. There is no unity in the Belgian electoral system, for while proportional representation has been employed in the legislative elections for the past ten years, the system of absolute majorities still continues in the communal elections, and the plural vote still prevails. The Catholic party, profiting by the present inconsistent system, has tried to put off reform. A measure of reform which applied the same principle to provincial and communal elections as was already observed in the parliamentary elections, had been submitted by a parliamentary commission. The Liberals and Socialists wished the measure carried at once in order that it might be applied in the October elections. But the ministry demanded that other matters be considered first and put off the electoral measure until it was too late. The Liberals and Socialists threatened the Catholics with an

alliance as the result of which the Catholics would be excluded from those communes in which the Socialists and Liberals taken together had an absolute majority. The antagonism between the latter parties had hitherto prevented such an alliance, but the hostility of both to the government's educational bill (see following paragraph) drew them together, and in a public demonstration on August 15, the complete union of the two parties on a definite programme was proclaimed. The Liberal-Socialist proposal was to unite in all the large cities, and thus gaining an absolute majority, to exclude the Catholics altogether from the communal governments. The municipal elections took place on October 15. The Liberal-Socialists made considerable gains. In Brussels all the Liberal-Socialist candidates were elected, and they were generally successful also in the suburbs of Brussels and in several large cities.

THE SCHOOL QUESTION. On March 14 the government presented a measure concerning schools which indirectly required the provincial and communal administrations to subsidize the Catholic schools. The opposition of the Liberal and Socialist groups was exceedingly bitter and was intensified by the exceptional measures which the government took in its endeavor to push the measure through the Chamber. The government's course alienated some of its own supporters. After debating the question for several weeks matters were still at the same point. All other parliamentary legislation was suspended and the month of June was reached without even any discussion of the budget. At this juncture the king intervened and advised M. Schollaert, the premier, to consent to the postponement of the school question as the only means of carrying through the necessary financial legislation. M. Schollaert was too deeply committed to this school policy to continue in the government and he gave in his resignation. A new ministry was formed under Baron de Broqueville, the former minister of railways, who held the same portfolio. In the middle of August the premier announced that owing to the opposition to the school bill the government would consider another plan. Mass meetings and processions, attended, it was said, by 150,000 people, were held in Brussels by the Liberals and Socialists as a protest against the government's educational policy. The alliance between these parties was publicly celebrated, and the two flags, the blue for the Liberals, and the red for the Socialists, were carried together through the streets. The programme of the allied parties was summed up in the formula, "One man, one vote, and compulsory education." They swore to continue the struggle until the school bill was finally withdrawn and until universal suffrage was obtained. The Catholic party replied with a counter-demonstration at Louvain, at which M. Schollaert received a popular ovation. The government adhered to its school policy which it planned to carry through at the earliest opportunity, though it was expected that very serious modifications might be required if it remained the government platform in the next general election.

THE QUESTION OF NATIONAL DEFENSE. The alarming rumors circulated throughout Europe as to the relations of France and Germany in the affair with Morocco led to much discussion in Belgium of the means of defense if war should break out between France and Germany. It

was generally recognized that the Belgian army would be incapable of offering a serious resistance to any invader who violated the neutrality of Belgian territory. Although the recent military law had increased the annual enrollment in the army and would eventually result in a considerable strengthening of the war effective, this did not seem sufficient, and the Liberals and Progressists were vigorously opposed to increased expenses involved in any extensive military improvement. They contended that the only means of securing national defense without laying the country under a crushing burden was to substitute a militia for the permanent army. They declared that that was the only means of drawing out the full strength of the country in a moment of danger. Under that system the entire nation would virtually be in arms in the event of a crisis. Such a plan, however, was most objectionable to the government. The minister of war had frequently declared that no soldier was properly trained who had not spent at least fifteen months in the barracks. On the other hand, the majority in Parliament would not consent to increase the number of recruits who had to undergo that long period of training. In August the government effected certain military improvements on the German frontier. The discussion of the subject revealed the general opinion that the Belgian army was not large enough to defend the frontier and, in the event of war, would have to fall back upon the fortified position of Antwerp, leaving the rest of the country exposed to the invader. Although the line of the Meuse had been recently fortified, this did not extend far enough to prevent the war from being waged in the interior of the country.

In reply to the interpellation by a Socialist deputy complaining that the military authorities had taken no adequate measures for defense, the war minister, General Hellebaut, declared that every necessary step had been taken and that in case of foreign invasion the Belgian military forces were fully prepared.

Considerable anxiety was occasioned in Belgium by the Dutch scheme for the fortification of Flushing, as a violation of the treaty of 1839. See *NETHERLANDS, History*.

OTHER MATTERS BEFORE PARLIAMENT. Parliament voted the law providing for old-age pensions to coal miners. It was published on June 9, 1911, and was to go into effect on January 1, 1912. The age at which a pension could be drawn was fixed at 60 years, but it was lowered to 55 years for those who had worked at least thirty years in the mines. It required contributions from employers and workmen until a pension of 360 francs a year was assured, after which the payment ceased to be obligatory. The language question continued to occupy the public mind both in and out of Parliament. The movement, summed up in the formula "Flemish for Flanders," gained force, especially at Antwerp, where the communal administration went so far, it was said, as to refuse to receive communications in French. In the educational field, the champions of the Flemish tongue had succeeded in having the instruction given in that language in the Flemish provinces where French was taught as a foreign language. This applied, however, only to secondary education and they now sought to extend it to higher education. Two measures were introduced into the Chamber for that purpose. The first required

that the state university at Ghent be changed into a Flemish institution. It was pointed out that this would seriously injure the university where not only Flemings but French-speaking students and many foreigners were in attendance. Accordingly, another measure was proposed authorizing the establishment at Ghent of Flemish courses along with those in French. The Flemish element rejected this and held out for the Flemish tongue throughout the university. The Walloons resented these demands and many heated discussions took place on the subject. Some demanded administrative separation, leaving Flanders to the Flemish and making the Walloons supreme in their own regions. Others favored a policy that would allow those Flemings who desired to retain French as their medium to do so.

THE ESTATE OF THE LATE KING LEOPOLD. The case of Princess Louise for the recovery of her share of the estate of the late King Leopold came up for trial. The fortune of the king was estimated by her counsel at 75,000,000 francs, of which only 20,000,000 had been bequeathed to the princess, the remainder going to the Niederfullbach Foundation, on whose behalf it was contended that the society had no right to the personal property of the king and that he had no right to bequeath it away from his family to the Niederfullbach Foundation, which was not recognized by the Belgian law. The court decided against her in November, 1911, the verdict requiring her to pay a large part of the costs, but held that a sum of money amounting to about \$300,000 given by the late king to the Niederfullbach Foundation a few days before his death should be divided between her and Princess Stephanie. Princess Louise entered an appeal from the decision. By the terms of the late King Leopold's will, \$3,000,000 was bequeathed to his daughters. As he had amassed an enormous fortune by his Congo enterprises, inquiries were set on foot to ascertain what had become of it and it was found that some \$7,000,000 had been given to the Baroness Vaughan, the king's morganatic wife, and that an amount estimated at \$10,000,000 had been invested in the concern known as the Niederfullbach Foundation. Princess Louise brought suit for the recovery of the latter sum as family property, but the Belgian government claimed that the profits belonged to the Congo State and were therefore the property of the government, which had annexed the colony in 1908. The present King Albert in order to avoid scandal had renounced in 1910 his claim and that of his children to any share of his father estate, and the Princess Clementine compromised with the government for \$720,000 before the case was tried. The other two sisters, however, had gone on to fight the case in the courts.

BELL, CHARLES FREDERIC MOBERLY. Managing director of the *London Times*, died April 5, 1911. He was born in Alexandria, Egypt, in 1847 and was educated at a private school in Lancashire. At the age of 17, his health being delicate, he was sent back to Egypt. At 21 years of age he became a partner in the firm of Peel & Co. Before this, however, he had become correspondent for the *Times* in Egypt and in this position made himself thoroughly acquainted with Egyptian politics in the personalities of all the important officials with whom he came in contact. His grasp of the English situation as it developed and changed from time to time was

shown in the three books on Egyptian affairs which he published during his stay in Egypt. The first of these was *Khedives and Pashas*, published anonymously in 1881. The second was *Egyptian Finance*, published in 1887, and the third a series of historical and descriptive sketches entitled *From Pharaoh to Fellah*. The progress of affairs in Egypt made the position of the correspondent of the *Times* one of great importance. Among the events which he described were the revolt of Arabi (q. v.), which led to the bombardment of Alexandria and the campaign of Tel-el-Kebir and the British occupation. His letters sent to the *Times* had a great influence on English public opinion in 1890. He was recalled from Egypt to take up the post of manager of the *Times*. The affairs of the paper at that time were in a critical condition owing to the death of the former manager and the expenditure incidental to the Parnell commission. By great exertion and constant devotion to the task, he succeeded in freeing the paper from its embarrassments. His constant endeavor was to widen the sphere of activity of the *Times* and to enlarge the range of its service by utilizing all the resources of its organizations. Among the enterprises which were undertaken under his direction were the *Times' Atlas*, the *Encyclopædia Britannica Supplement*, *A History of the South African War* and the *Times Book Club*. In the crisis which occurred in the history of the paper in 1908, and which resulted in the formation of the Times Publishing Company, Limited, he took a prominent part. The reconstitution then effected was the result of suits instituted in the lower courts for the purpose of adjusting the more or less conflicting rights and interests of the several proprietors of the paper. Bell was chosen managing editor of the Times Publishing Company. Aside from his duties as business manager of the paper, he kept in close touch with the editorial side through his dealings with the staff of permanent and special correspondents abroad. He took a great interest in newspaper copyright and was largely responsible for establishing the legality of newspaper copyright even in news.

BELL, JOSEPH. A Scotch surgeon, died in October, 1911. He was born at Edinburgh, in 1837, and was educated at Edinburgh University. Having studied medicine he engaged in the practice and became one of the most successful surgeons in the United Kingdom. He was for nearly twenty-five years identified with the Edinburgh Royal Infirmary as surgeon. On his retirement from this post he was made consulting surgeon of this hospital. For over twenty years he was editor of the *Edinburgh Medical Journal*. He was the author of *A Manual of Surgical Operations* (1894), and *Notes on Surgery for Nurses* (1906). When Sir Conan Doyle was a medical student at Edinburgh University, he was so impressed by the intuitive powers of Dr. Bell in the examination of patients and making successful deductions from what appeared to be trivial details that he largely based on him the famous character of Sherlock Holmes.

BELLEW, HAROLD KYLE MONEY. An actor, died November 2, 1911. He was born in Calcutta, India, in 1857. For seven years he served as cadet in the English navy and then went to the Australian gold fields. He worked for a time on newspapers in Melbourne and then

returned to England. He made his début on the stage at the Theatre Royal at Brighton and showed such talent that he soon became leading man and starred in London. In 1882 he came to the United States to appear in *Diana le lys*. When he discovered that the play had failed in Paris he refused to take the part. He came again to the United States in 1885 as leading man in Wallack's Theatre. He soon became one of the most popular actors on the American stage. At Wallack's he played a long line of parts in the classic drama as well as the modern repertoire. He was especially successful in such melodrama as *Harbor Lights* and in *Clarissa*, a dramatization of Richardson's novel. His greatest successes, however, were in the so-called costume or romantic drama. While acting at Wallack's Theatre he met Mrs. James Brown Potter and when she became an actress they played for many years together. He took leading roles with her in legitimate drama in all English-speaking countries. Among the plays in which they appeared jointly were *Civil War*, *Loyal Love*, *Romeo and Juliet*, *Antony and Cleopatra*, and *The Queen's Necklace*. In 1900-02 he headed an exploring expedition in North Queensland. He returned to the stage at the head of his own company in 1902. His most popular portrayals in recent years were the hero in *Raffles*, and the husband in *The Thief*. At the time of his death he was undoubtedly among the most distinguished actors speaking the English tongue. He was the author of *Yvonne*, *Iolande*, *Hero* and *Leander*, *Charlotte Corday*, and several adaptations.

BELLOC, HILAIRE. See LITERATURE, ENGLISH AND AMERICAN.

BENEDICT, ROBERT DEWEY. An American lawyer, died in July, 1911. He was born at Burlington, Vt., in 1828 and graduated from the University of Vermont in 1848. He studied law and was admitted to the bar in 1851. He established a practice in New York City and continued there until 1906 when he retired. He made a specialty of admiralty law. He was the author of *Cases Argued and Determined in the District Courts of the United States within the Second Circuit* (10 vols. 1869-1882), and edited *Benedict's Admiralty*. He also wrote and published several addresses. He was a member of several learned and patriotic societies.

BENGAZI. See TRIPOLI.

BENNETT, ARNOLD. See LITERATURE, ENGLISH AND AMERICAN.

BENNETT, MADELINE (SCHILLER). A German-American pianist, died July 4, 1911. She was born in London of German parents. She first studied music under Isaacs, a noted London teacher, and later took lessons from Sir Charles Benedict and Sir Charles Halle. She studied also in Leipzig, where she was for over a year a pupil of Moscheles. Her début as a pianist was made in that city, when she played the G minor concerto of Mendelssohn. Her success was so great that she traveled through the cities of Germany before she made her first appearance in London. Following this she made a successful tour of Australia. She came to the United States and was married to Marcus Elmer Bennett of Boston. She then settled for several years in that city. She re-

turned to Australia and after a tour of continental capitals came back in 1898 to New York. She was obliged to retire from public appearances on account of ill health and for the remainder of her life was engaged in the teaching of music.

BENTON, JOEL. An American poet and author, died September 15, 1911. He was born in Amenia, N. Y., in 1832, and was educated at Amenia Seminary. He taught school and for a time engaged in journalism. He was the author of *Emerson as a Poet* (1882), *The Truth about Protection* (1892), *Greeley on Lincoln* (1893), and *In the Poe Circle* (1899). He also contributed poems and criticisms to periodicals and occasionally lectured for lyceums and on public occasions.

BENUE RIVER. See EXPLORATION.

BEREA COLLEGE. An institution of higher learning, founded in 1855, at Berea, Ky., for the education of the white youth of both sexes in the mountain regions of Kentucky and the neighboring States. There were enrolled in the various departments of the college in 1910-11 1129 students. The faculty numbered eighty. Among the new appointments for the year 1911-12 were those of Edward C. Downing, Ph. D., dean of the collegiate department and professor of Latin; Horace E. Cromer, acting professor of mathematics; Mrs. Anna Ernberg, director of fireside industries, and Miss Blanche Thurston, instructor in cabinet organ and piano. During the year a gift of \$100,000 was received from Dr. Daniel K. Pearsons of Chicago, on his ninety-first birthday, April 14, 1911. The productive funds of the college amount to \$800,000, and the income from home sources to about \$53,000, leaving \$57,000 to be raised by current gifts to meet a budget of \$110,000. The institution is segregating its work in five distinct departments, each with its own faculty, and will have ultimately in separate buildings, the college proper, the normal school, the academy, the vocational schools, and the foundation school for young people of some maturity who are still in the elementary branches. In the vocational schools the college is making prominent such special adaptations as mountain agriculture and woodwork for men and nursing and household management for women. The normal department is giving special attention to the rural conditions which exist in their most extreme forms in the mountains. The library of the college contains about 25,000 volumes. The president is William Goodell Frost, Ph. D., D. D.

BERGSON, HENRI. See PHILOSOPHY.

BERIBERI. The nearly complete eradication of beriberi from the Philippine Islands by the simple method of substituting hand-milled for polished rice was hailed as a triumph of modern sanitation. Prior to May, 1910, beriberi was very common in the islands, in jails, lighthouses, charitable institutions, leper colonies, and among the Filipino scouts of the United States army. At this time, as the result of extensive investigation into the subject, the government decided that the cause was a staple diet of polished rice, and issued an order prohibiting the use of grain so prepared in all public civil institutions. The effect was immediate. Since August, 1910, according to Heiser, only two cases of beriberi were observed in the above mentioned institutions. An unusual opportunity to study the influence of diet

on the development of beriberi was offered to Frazier and Stanton in the employment of 300 native laborers in the construction of a road through the virgin Malayan jungle. By examining the candidates for work, they first excluded men already suffering from the disease. The laborers chosen were divided into two equal parties, who were housed at a distance from each other, but under similar sanitary conditions. One party was then fed on polished rice as the staple article of diet, the other on rice which had been parboiled before husking, the latter grain differing from the former in the preservation of a great part of the sub-pericarpal layers, which are removed almost wholly by the usual methods of polishing. Of the two parties, the men fed on polished rice began to develop cases of beriberi in three months, while the other party remained perfectly free from the disease. Conditions were then reversed, and after a somewhat longer period the party previously exempt began to develop symptoms. The polished rice thus responsible for human beriberi was then tested by feeding fowls with it. It was already known that chickens fed on such grain would develop an affection closely resembling human beriberi, and Frazier and Stanton were able to cause a similar condition in the fowls with which they experimented. Attempts to extract a soluble poison from the polished grain were unsuccessful, but they did succeed in determining to a certain extent the element essential for protection against beriberi, namely phytin, a complex organic compound containing a high percentage of phosphorus pentoxid. As the amount of phosphoric acid in the grain had been found to give an index to its power to prevent beriberi, it was first thought that this might be the desired constituent, but feeding experiments contradicted this view, while the extract, after removal of the phytin, was still effective. The Philippine government considers rice which contains less than 0.4 per cent. of phosphorous pentoxid as polished rice, and that which contains over 0.4 per cent. of phosphorous pentoxid is regarded as unpolished rice. Another confirmation of the polished rice theory is found in the use of rice bran. Bréaudat and Denier report from the Pasteur Institute at Saigon, Indo-China, that rice bran seems to remove the cause of beriberi and prevent its development. They gave the bran in the form of pills, about forty grams of the bran being added daily to the ordinary diet. It never caused any digestive disturbance and it had a decided curative action. Two hundred and ten native soldiers who took the pills remained free from beriberi for six months, while 17.4 per cent. of 311 soldiers who did not take the pills developed the disease.

BERLIN. See MUNICIPAL GOVERNMENT.

BERLIN, RIOTS IN. See GERMANY, *History*.

BERMUDA. A British colony, made up of over 300 small islands lying east of North Carolina and 677 miles from New York. Total area, about 19 square miles. Total population (1901), 17,535 (6383 whites); 1911, 18,994 (6891 whites). Chief town, Hamilton, with (1911) 2627 inhabitants. Onions, potatoes and other vegetables, lily bulbs, and arrowroot are grown.

Imports for 1909 were valued at £440,648, exports £183,884. Trade with Great Britain (1910), £158,043 and £2475. There are 214 miles of military, and 1200 of private telephone lines; and the colony is connected by cable

with Halifax, Nova Scotia, Turks Island, and Jamaica. Post offices, 19. Revenue and expenditure (1910), £78,593 and £68,392. Public debt, £45,500. The governor (1911, Lieut.-Gen. Sir F. W. Kitchener) is also commander-in-chief of the military forces.

BERNIEB, J. E. See POLAR RESEARCH.

BERTEAUX, HENRI MAURICE. French minister of war, killed by an aeroplane in Paris on May 21, 1911. He was born at Saint-Maur-les-Fossés in 1852. He engaged in the business of stock-broking and made a fortune early in life. He was elected mayor of Chatou and was made a member of the Legion of Honor. He became interested in Socialism and in 1893 he was elected to the Chamber of Deputies as a representative of Versailles and as a Radical-Socialist. He showed an interest in military affairs and in 1902 headed the committee of the Chamber of Deputies that presented the war budget. In 1904 when General André resigned the portfolio of minister of war in the Combes ministry. Berteaux was selected to fill the office. The selection was received without enthusiasm by the people. At the end of a year's service he resigned the office. In the meantime, M. Combes had resigned, but his successor, M. Rouvier, had continued Berteaux in the cabinet. His administration of the ministry of war at this time was not particularly notable. He assigned the active duties of the office to General Peigne. In 1905 he showed himself opposed to duelling by ordering the arrest of generals Magron and Percin, who were making preparations to fight a duel. He took part in the functions connected with the removal of the body of John Paul Jones from France to the United States. Following his retirement from the ministry of war, he was made president of the army commission of the Chamber of Deputies. He was several times reflected as a deputy and was vice-president of the Chamber in 1906. In the spring of 1911 the portfolio of the war minister was offered to him by Premier Monis and it was accepted. He was looked upon by those familiar with French politics as one of the few strong men in the Monis ministry. See FRANCE, *History*.

BETH-SHEMESH. See ARCHAEOLOGY, *Palestine*.

BIBLE SOCIETY, AMERICAN. The American Bible Society, founded in 1861, has for its purpose the encouragement of a wider circulation of the Holy Scriptures without any comment. The year 1911 was the ninety-fifth of its existence. During the year 1,028,357 volumes of Biblical literatures were issued. This total was made up of 278,009 Bibles, 300,159 Testaments, and Testaments and Psalms, 448,157 portions of Scripture, and 2032 volumes in the various raised characters for the blind. Scriptures were issued in eighty languages other than English. The largest number issued was in the Spanish language, 259,996. The society maintains agencies among the colored people of the South and in other parts of the United States, in the West Indies, Mexico, Central America, Venezuela, Brazil, the Levant, Siam, China, Korea, Japan, Philippine Islands, Africa, and Micronesia. The total appropriations for its work in 1911 amounted to \$790,230.

BICYCLING. See CYCLING.

BIGELOW, JOHN. An American author, diplomat, and publicist, died December 19, 1911. He was born in Malden, Ulster county, New

York in 1817 and graduated from Union College in 1835. He studied law and in 1839 was admitted to the bar. Following his graduation from college he took up his residence in New York City. This remained his home until the time of his death. Together with the practice of law he began to write for the newspapers of that time, and his articles on constitutional reform published in 1845 were widely circulated and caused a great deal of comment. In the same year he was appointed an inspector of Sing Sing prison, and held this office for one year. After serving as editor of a periodical called the *Plebeian* and of the *Daily News*, he became an editor and part owner of the *New York Evening Post* in 1849. This was brought about largely by his support of the candidacy of Martin Van Buren in his writings which brought him to the notice of William Cullen Bryant, at that time editor and proprietor of the *Post*. He continued as part proprietor and managing editor until 1861. In this year began his diplomatic career in his appointment as consul at Paris by President Lincoln. This post he held until 1864 when he was promoted to be minister to France to succeed William L. Dayton, who died. The difficulties of this position were very serious on account of the intrigues of the French Emperor with the commissioners of the Confederacy. He discovered and frustrated the attempt of the French government to supply the Confederate States with four ironclad warships. In August, 1865, he wrote to Secretary of State Seward in reference to the relations between the United States and France as affected by the French operations in Mexico. This drew from Mr. Seward the remarkable state paper which practically resulted in the destruction of the French Emperor's hopes for an empire in Mexico. On February 12, 1866, Mr. Bigelow presented to the French government the note which demanded the withdrawal of Napoleon's troops from Mexico, to which France was forced to accede and which resulted in the abandonment and death of Maximilian. His historical and literary aims resulted in his acquisition during his service as minister to France, of many important and interesting materials which he used in his later writings. Among these was the original manuscript memoirs of Benjamin Franklin. During his residence in France he published in French *Les États Unis en 1865*, and *Some Recollections of Antoine Pierre Herryer, and France and Hereditary Monarchy*. At the conclusion of his service as minister, Mr. Bigelow after a brief return to the United States went to Berlin for the purpose of having his children educated in that city. In 1873 he returned to the United States and at once took up literary work. He resumed a friendship which dated back for several years with Samuel J. Tilden, who, two years later, appointed him one of four commissioners to investigate the management of the State canals. This investigation resulted in the overthrow of the canal ring. In recognition of this work Governor Tilden secured for him the nomination for secretary of state, to which he was elected by defeating Fred W. Seward, the Republican candidate, by 14,810 votes. At the expiration of his term of office he and Mr. Tilden went together to Europe for a tour of recreation. In 1885 the post of assistant treasurer at New York was offered to him by President Cleveland,

JOHN BIGELOW
HIS LAST PHOTOGRAPH

but this he declined. He went to Panama to report to the Chamber of Commerce for New York City the prospects for the completion of the canal under De Lesseps. He made a careful investigation and reported that while the problem seemed to be a very simple one yet nothing in fact could be more delusive. The Chamber of Commerce was so pleased with the manner in which the investigation had been conducted that Mr. Bigelow was elected an honorary member of that body. In 1888 he was appointed by President Cleveland United States commissioner to the Exposition at Brussels. He was a member of the New York State constitutional convention of 1894.

By the will of Samuel J. Tilden, Mr. Bigelow was appointed a trustee of the money left by the former, which was to be applied to the establishment and maintenance of a public library. By the terms of the same will he was also made Mr. Tilden's authorized biographer and in 1875 he published his *Life of Samuel J. Tilden*. Mr. Bigelow was throughout his life a Democrat, but his period of great activity in politics ended with the death of Mr. Tilden. He did not hesitate, however, at various times to express his opinion in regard to current political methods. He regarded the war with Spain as entirely unprovoked and he held President McKinley responsible for it. He was opposed to William J. Bryan and characterized him as having the merits and limitations of a first-class newspaper reporter. In 1906 he supported Charles E. Hughes for Governor of the State of New York. In spite of his opinion of Mr. Bryan he supported the latter's candidacy in 1908, regarding as the chief issues the organization of an opposition party and further revision of the tariff. Most of his writings in his last year were in favor of tariff reform. Mr. Bigelow took the greatest interest in the development of the public library system in New York City, and at the time of his death was president of the Board of Trustees of the New York Public Library, Astor, Lenox and Tilden foundations. In spite of his advanced years he continued to make yearly visits to France and other European countries. His last trip was made in the spring of 1911. His last public appearance was at the dedication of the New York Public Library on May 24, 1911.

Mr. Bigelow not only met practically every prominent contemporary American statesman, but was a warm friend of such eminent English statesmen as Richard Cobden, John Bright, and Mr. Gladstone. During one of his visits to England he dined with Thackeray. He continued in active literary work almost until the time of his death. He was engaged in the further writing on his *Retrospections*, of which several volumes had already been published. His published writings, in addition to those already mentioned include: *Jamaica in 1850* ('852); *Life of Benjamin Franklin* (1868); *France and the Confederate Navy* (1888); *The Bible that Was Dead and is Alive Again* (1893); *The Life of William Cullen Bryant* (1893); *The Mystery of Sleep* (1897); *Gladstone, Morley and the Confederate Loan of 1865* (1905); *What Shall We Do for Our Presidents and What Shall They Do for Us?* (1906); *Letters and Literary Memorials of Samuel J. Tilden* (1908); and *Retrospections of an Active Life* (3 volumes, 1910).

BIJAGOZ. An archipelago administered under Portuguese New Guinea (q. v.).

BILLIARDS AND POOL. Professional billiard matches were few in number in 1911, the players in this class appreciating the hopelessness of trying to wrest the championship from William Hoppe. George Sutton did finally challenge Hoppe for the 18.2 laurels, but was easily defeated by the score of 500 to 286. In other professional matches Hoppe defeated A. Curé, the French champion, and George Slosson. The three-cushion game continued to prove popular in 1911. Alfred de Oro successfully defended his championship title in matches with Thomas A. Hueston, George Wheeler, and John A. Day, the contest with the latter being a very close one. De Oro also retained his title as continuous pool champion, defeating Jerome Keogh, W. H. Clearwater, W. Douglas, Thomas Hueston, and Alexander Smith.

There was much greater activity in amateur billiard circles during the year than in the professional ranks. Charles F. Conklin of Chicago won the international amateur 18.2 balk-line championship against a good field by defeating J. F. Poggenburg of New York in the play off for first place. Edward W. Gardner of Montclair, N. J., finished third and Albert Poensgen of Munich, Germany, fourth. In the class B. competition, G. P. B. Clarke won the title after a triple tie in which C. E. White, the champion of 1910, figured.

BIOGRAPHY, LITERARY. See LITERATURE, ENGLISH AND AMERICAN.

BIOLOGICAL LABORATORIES. An important change at the Marine Biological Laboratory at Woods Hole, Mass., was effected by the resignation of Dr. G. A. Drew, assistant director of the laboratory, from his teaching position at the University of Maine, to give his entire time to research and to the administration of the laboratory. This will enable investigators to work at the laboratory at any time in the year. It is expected that new, well-equipped buildings for research will be erected at the laboratory in the near future. At the Carnegie laboratory at the Dry Tortugas, new buildings were put up to replace those injured by a hurricane in 1910. These are of a more permanent character than the old ones, experience having justified the choice of the Tortugas as a permanent station. A new motor boat, the *Anton Dohrn*, with 100-horsepower gasoline engines, was added to the equipment of the laboratory in 1911.

BIOLOGY. General topics relating to researches on heredity, evolution, sex, etc., are treated in this article. For morphology of animals, see ZOOLOGY; of plants, see BOTANY. Special articles dealing with insects, fish and birds will be found under the headings, ENTOMOLOGY, FISH AND FISHERIES, and ORNITHOLOGY, respectively.

HEREDITY. As has been indicated in previous YEAR BOOKS, a most important development of biological research in recent years has been the increasing attention paid to the study of heredity, from both the Mendelian and the statistical points of view. (See YEAR BOOK for 1910 for the difference between Galtonism and Mendelism). An enormous mass of data has now been accumulated especially in connection with the applications of Mendel's law. Any general conclusions concerning the significance of these re-

sults would at the present time be merely tentative, to be held only until further investigation shall furnish new material for consideration. So far as can be seen at present the "presence and absence" hypothesis (see YEAR BOOK for 1907), according to which a character is allelomorphic to its own absence, offers the most rational explanation of some observed phenomena. Much information has also been obtained on the subject of sex-limited heredity, in which some special character, not a true secondary sex character, appears in connection with only one sex. Renewed evidence has been obtained in favor of the hypothesis that bodily characteristics may be due to the combination of several component "factors" which, following Mendel's law, may be separated and recombined into entirely new combinations. The loss of a single one of these factors may be sufficient to cause the apparent loss of the characteristic. A good illustration of these forms of heredity is given in Morgan's results in breeding the fruit fly, *Drosophila*. In laboratory cultures of these animals, which normally have red eyes, there appeared individuals with white, pink, vermilion, and orange-colored eyes. Each of these mutants bred true if bred with its own color, but when crossed with others, gave either the normal red, or one of the other above-mentioned colors in definite proportions. This Morgan explains on the assumption of factors R, P, and O for red, pink, and orange respectively, vermilion being due to a combination of P with O. In addition there is an activating agent C which must be present if any color is to appear. Thus, if (the absence of a character being represented by a lower-case letter, its presence by a capital) the factors present in the eye be CRPO, its color will be red; if cRPO, white; if CrPO, pink; if CrPo, orange. Morgan assumes that these factors are carried by the chromosomes, and further assumes that one, the "X," chromosome determines sex. In the fruit fly the white-eyed condition is associated with the male sex. In this and other sex-limited characteristics Morgan supposed the chromosome structure which produces the characteristic to be permanently associated with the X chromosome, a supposition for which he found evidence in his experiments. This assumption of a factorial combination of characters affords a plausible explanation of the phenomena of atavism. If a characteristic is produced by a series of factors, all of which must be present if the characteristic is to appear, the loss of one factor is sufficient to cause the apparent loss of the characteristic. The other factors might remain, and if at any later breeding the individual happens to mate with one possessing the missing factor, the lost characteristic will reappear.

SEX HEREDITY. While no adequate explanation has yet been advanced for the meaning of sex, evidence is accumulating that sex is a characteristic which is inherited in accordance with Mendel's law. As was indicated in the YEAR BOOK for 1910, there is reason to believe that sex is in some way determined by the accessory chromosome. While most of the chromosomes of the egg and spermatozoön are paired, there has been found in some cases one chromosome either unpaired or paired with one of unequal size. These are known as the X and Y chromosomes respectively. Thus in some insects, the female body cells have one more chro-

mosome than the male. The eggs are alike in the number of their chromosomes while the spermatozoa are of two sorts, half with a number equal to that of the egg, and half with one less. The extra chromosome in half of the spermatozoa is the X. An egg fertilized with this develops into a female, while an egg fertilized with the other form develops into a male. This may be purely a quantitative process, the female simply having more chromosomal material than the male, or there may be a true qualitative difference. Stated in Mendelian terms the female is heterozygous, or a hybrid as far as sex is concerned, while the male is homozygous. If as sometimes happens there is a Y chromosome as a mate to the X, it is supposed not to have any relation to sex determination, since the results are the same as if the Y were absent. In some animals the male has the extra chromosome, and is apparently heterozygous, while the female is homozygous. Morgan believes, however, that there must be a definite determiner for the male as well as for the female, though it is not carried by the X chromosome.

CHROMOSOMES. The results of chromosome study were summarized by Wilson. "Studies on the chromosomes have steadily accumulated evidence that in the distribution of these bodies we see a mechanism that *may* be competent to explain some of the most complicated of the phenomena that are being brought to light by the study of heredity."

EUGENICS. By the will of Sir Francis Galton (q. v.), who died on January 17, 1911, his residuary estate of about £45,000 was left to found at the University of London a laboratory for the study of eugenics. The term was defined in Galton's will as "study of the agencies under human control, which may improve or impair the racial faculties of future generations physically and mentally."

A special request was made that Professor Karl Pearson should be the first director of this laboratory, and he has since begun the organization of the work. At Cold Spring Harbor, eugenics headquarters for the work in the United States have been established under the general direction of Dr. C. B. Davenport, with H. H. Laughlin in immediate charge. Several field workers have been trained and were at work in 1911 collecting data of heredity along a number of different lines. Davenport apparently considers that many defectives are not pathological, but have merely retained ancestral characters which the majority of mankind have dropped in the course of their evolution. Under modern conditions defectives are not eliminated so ruthlessly as formerly, and are even allowed to reproduce. Davenport declared that "society must find some way to end these animalistic blood lines or they will end society." Miss Elderton concluded from investigation of the offspring of the marriage of first cousins, that (1) there is no evidence as to whether these unions are more or less fertile than other marriages; (2) the issue of such marriages is apt to show a greater mortality under the age of thirty; (3) albinism, deaf mutism, etc., are more apt to occur among the issue of such marriages than among the general population. The Eugenics Education Society, of which Leonard Darwin is president, reported that branches have been started in New Zealand, where already eugenic ideas are being embodied in state legislation. Books of the year dealing with heredity

are Castle, *Heredity*; Darbyshire, *Breeding and the Mendelian Discovery*; and a new edition of Punnett, *Mendelism*. Kellcott's *Social Direction of Human Evolution* is a popular account of the aims and methods of eugenics.

MUTATION. As stated above, Morgan found definite mutants occurring among the cultures of fruit flies. He was also able, as were independently Loeb and Bancroft, to produce mutants in these flies by subjecting them to the action of radium. This treatment resulted in changes in such characters as the form of the wings, etc., some of which appeared in subsequent generations.

There was, however, difference of opinion among biologists as to the value of mutations in evolution. Davis, as a result of experiments on the evening primrose, decided that the *Oenothera lamarckiana*, which was the form used by de Vries, is not a true species, as de Vries supposed, but is really a hybrid between *O. biennis* and *O. grandiflora*. Thus its apparent sporting character is merely a separation into its component species. Osborn accepted the validity of this argument as bearing out his own observation on the titanotheres, where he found that new characters arise by a gradual change, the final organism being composed of a complex of these characters. If this is crossed with another race, the hybrid will possess a combination of these characters and thus show mutation. Osborn thinks that most experiments in favor of discontinuity in evolution have been performed on hybrids. Gates, however, while admitting the force of the evidence that *Oenothera lamarckiana* is a hybrid, thinks that true mutations have appeared.

INHERITANCE OF ACQUIRED CHARACTERS. Maciesza and Wrzosek repeated the experiments of Brown-Séquard of sectioning the ischiadicus nerve of the guinea pig. In Brown-Séquard's experiments this operation was, he thought, followed by epilepsy, which was transmitted to the offspring of the injured animals. The authors found that abnormalities did often follow the operation, and that these were like those found by Brown-Séquard. Examination of the untreated animals showed, however, that in the ordinary course of things, quite as large a proportion of the animals showed these abnormalities as Brown-Séquard or they had found in the operated ones. Similar experiments on white mice showed also that there are no more abnormalities in the offspring of injured mice than in those of uninjured ones.

GERM PLASM. An important part of Weismann's theory of heredity is that the Metazoa differ essentially from Protozoa in a sharper distinction between body plasm and germ plasm. Calkins showed that the distinction is not a valid one, for there is really a separation in the Protozoa, between the gametes, which continue the race, and body plasm, which dies. This is more obscure in forms like *Paramecium*, where the body plasm remains as a carrier of the germ plasm. The dividing and degenerating meganucleus represents the body, while the micronucleus represents gametes, most of which do not conjugate. Child, discussing the regeneration of a new planarian from a fragment of an old one, considers this fragment to be as much germ plasm as anything in the egg. Thus body and germ plasm are essentially the same thing. Hargitt, working on the development of the hydroid egg, found that the cleavage is so ir-

regular, and that it is so largely a matter of chance whether any particular cell will grow into a part of the larva or become food for the other cells, that it was difficult to conceive of of a germ plasm separate from body plasm, in the sense in which Weismann used the terms.

VITALISM AND MECHANISM. Driesch and others (see YEAR BOOK for 1908) believe that many observed phenomena, especially those connected with regeneration, can only be explained on the assumption of a vital force or "entelechy," which, though not subject to the laws of force which govern the activities of organisms, are a regulating mechanism for these activities. This has apparently met with little favor among biologists in general, who hold that, even if the opposite or mechanistic theory of life has not been proved, more progress will be made by using it as a working hypothesis than by accepting vitalism. Wheeler drew a parallel between an ant community and an organism. In the ant community there is regulation and adjustment exactly as in the organism, and an entelechy is as superfluous in the one case as in the other. Loeb also, as a thoroughgoing mechanist, stated that we already know that many so-called vital processes are enzyme activities, thus purely chemico-physical in their character. Illustrations are digestive and assimilative processes in animals. Loeb thinks he has shown that the fertilization of the egg is purely a chemico-physical process, since by the addition of chemicals the action of the spermatozoön in fertilization can be perfectly replaced. The riddle of heredity, as he thought, now reduced itself to a chemico-physical question, since we know an exact relationship exists between definite characteristics and certain chromosomes, and know that in some characteristics, as e. g. the production of a black color, we have to deal merely with an enzyme acting upon a definite substance. The harmonics which we see, and which seem to need an entelechy for their explanation, are really only the few adjustments which happened to appear as adjustments. We forget that they are but a fraction of the number of attempts at adjustment, which have proved to be disharmonies, and have disappeared because of lack of adjustment to environment. Child reached somewhat similar conclusions in the discussion of results of extended experiments on regeneration in the planarians. The living organism is the product of its own functioning, and not a machine put together before it begins to function. Thus a process of adjustment, or equilibration, has arisen. He believed, in agreement with Loeb, that present-day adaptations are only the few which were able to survive, the majority of attempts at adaptation having been unsuccessful. Thus the regulation and the structure must have grown up together, and there is no need for entelechy, biophores, pangenes, etc. It is inaccurate to set off certain processes as "regulations," but we should regard them as essentially similar to all life processes.

MECHANISM OF HEREDITARY TRANSMISSION. In some cases, the chromosomes of the sex cells seem to have definite relations with the transmission of characteristics from one generation to the next, but some biologists believe that the cytoplasm of the sex cell is as important in this process as is the nucleus. Hertwig (See YEAR BOOK for 1910) believes in the nucleus as the carrier of heredity, and experimented on the effects of treating the eggs and sperm with ra-

dium rays. Developing embryos treated with radium gave abnormal embryos. If the sperm were "rayed" before fertilization, fewer abnormal embryos appeared. G. Hertwig followed with similar experiments from which he concluded that more abnormalities appeared if the nucleus were affected than if the cytoplasm had been injured. From this he concluded that the nucleus is the essential organ in determining the character of the offspring.

CONCEALING COLORATION IN ANIMALS. Gadow, from a study of the coral snakes, concluded that there is no reason to consider their color as protective, since more mimicking than mimicked forms may be present on the same area. Punnett made a study of Ceylon butterflies. In the case of *Papilio polytes*, he found three types of females: (1) like the male; (2) like *P. aristolochiæ*; (3) like *P. hector*. Wallace supposed (2) and (3) to mimic distasteful forms, since *P. polytes* is edible. Punnett found that in the low country the *polytes* form is as abundant as either of the others. In the northeast of the island where *P. hector* occurs the *aristolochiæ* form is as abundant as the *hector*, though the model is scarce. Where *P. hector* is rare or absent and *P. aristolochiæ* is common, the *hector* form of *polytes* is more abundant than the *aristolochiæ*. Punnett concluded that, as serious enemies of insects, birds may be left out of account. The difficulty in the way of supposing that small variations have a selective value led Punnett to conclude that these color varieties arise through mutation and not through selection. The fact that only females do the mimicking leads to the suggestion that there is a gametic coupling between these characters and the female sex. Manders stated that in Bourbon and Mauritius there are no insect-eating birds or reptiles; hence cases of mimicry reported from there are not due to development of color as a protection from enemies. In Ceylon, butterfly-eaters are impartial feeders, and the differences between the mimicking and the mimicked are so easily seen that birds must be able to detect the differences. *Euplaeas* are eaten by *Drongos*, hence the *Papilio* imitating *Euplaeas* is not protected. On the other hand, Pockock, from a study of British insects, concludes that they are protected by their color and other characters. Thayer's theory of concealing coloration was severely criticised during the year, notably by Roosevelt, who declares that in most cases in birds and mammals coloration is of slight importance from the standpoint of preserving life, as compared with the animal's cunning, wariness, ferocity, speed, etc.

BIRD, JOHN T. An American jurist, died May 6, 1911. He was born at Bethlehem, N. J., in 1829, and spent his early life on his father's farm. He became a school teacher and after studying law was admitted to the bar. He was made prosecuting attorney of Hunterdon county and served in Congress from 1868 to 1872. In the latter year he was appointed a member of the New Jersey Constitutional Convention and in the same year was appointed vice-chancellor of the State. He served in that capacity for fourteen years.

BIRD PROTECTION. See ORNITHOLOGY.

BIRMINGHAM, ALA. See ALABAMA.

BIRMINGHAM, ENG. See NAVAL PROGRESS, paragraph *Propulsion*.

BISMARCK ARCHIPELAGO. A German

protectorate under the administration of German New Guinea. Estimated area (with German Solomon Islands), 22,000 square miles; estimated population, 250,000. Whites in 1910, 462.

BLACKFOOT. See ANTHROPOLOGY.

BLANCHE. See NAVAL PROGRESS, paragraph *Propulsion*.

BLISS, CORNELIUS NEWTON. An American merchant and public official, died October 9, 1911. He was born at Fall River, Mass., in 1833, and was educated in the public and high schools of that city. His father died when he was a boy, and his mother remarried and moved to New Orleans, where at the age of fourteen years he joined her. He found the South uncongenial and returned to Boston, where he secured employment in the importing house of James M. Beebe & Company. He rose step by step until he became a member of the firm. In 1886 he became a member of the firm of J. S. & E. Wright, doing a dry goods commission business. This firm had a branch in New York and Mr. Bliss took charge of this. The firm name was changed later to Wright, Bliss & Fabyan, and then to Bliss, Fabyan & Company. Mr. Bliss became active in politics immediately upon his taking up residence in New York City. He became a warm friend of Chester A. Arthur, who at that time controlled the Republican organization. In 1884 he headed a citizens' committee which urged the nomination of Mr. Arthur to the presidency before the Republican convention of that year. In 1887 he was elected chairman of the Republican State Committee and in this office he served for two years. He was also president of the American Protective Tariff League for many years. In 1892 he was selected as treasurer of the Republican National Committee, and was selected again for the campaign in 1896. His financial management of this campaign is considered a model of efficiency. He raised a large fund and kept a strict account of every dollar expended. The campaign closed with a surplus in the treasury. As a reward for this work, President McKinley offered him the treasury portfolio, but he declined. He was afterwards persuaded to accept the office of Secretary of the Interior and he served in this office until 1898. In that year he returned to the conduct of his business, but in 1900 he was again called upon to act as treasurer of his party. He was again treasurer in 1904. An attempt was made to draw him into the controversy at that time brought about by the charges made by Alton B. Parker, the Democratic candidate, that large contributions had been made to the Republican campaign fund by corporations of the country. Mr. Bliss refused to make any public statement in regard to the matter. He did not serve again as treasurer of the committee. In 1896 an attempt was made to nominate him Vice-President on the ticket with McKinley, but he refused. He was many times mentioned as a possible candidate for governor of the State and mayor of New York, but would not consent to be placed in nomination for these offices. He was antagonistic to the policies of President Roosevelt, and with the ascendancy of these he ceased to take an active interest in politics. He was president of the Union League Club of New York City for several years. He was also president of the New York Hospital.

BLOXAM, WILLIAM DUNNINGTON. An American public official, formerly governor of Georgia, died March 15, 1911. He was born in Leon county, Fla., in 1835 and graduated from William and Mary College in 1855. In 1860 he was elected a member of the Florida House of Representatives. He served in the Civil War, rising to the rank of captain in the Confederate army. He was elected lieutenant-governor of Florida in 1876 and was secretary of state from 1877 to 1881. He served as governor from 1881 to 1886 and again from 1897 to 1901. In 1885 he was offered the appointment of minister to Bolivia, but declined. From 1890 to 1896 as state comptroller.

BOGERT, EDWARD STRONG. A medical director and rear-admiral, retired, of the United States navy, died February 16, 1911. He was born in Geneva, N. Y., in 1836, and was educated in the public schools of that town and of Brooklyn, N. Y. He studied medicine and was appointed assistant surgeon in the United States navy in 1861. In 1864 he was promoted to be past assistant surgeon and in 1866 to be surgeon. In 1882 he was appointed medical inspector and in 1889 medical director. He was retired in 1898 and in 1906 he was advanced to the rank of rear-admiral for services during the Civil War. From 1892 to 1895 he was in charge of the Naval Hospital in New York.

BOGGS, WILLIAM ROBERTSON. An American soldier, died September 15, 1911. He was born in Augusta, Ga., in 1829, and graduated from the United States Military Academy in 1853. He resigned from the United States army in 1861 and served in the Confederate army from its organization until it was disbanded in 1865, attaining the rank of brigadier-general. From 1863 to the close of the war he served as chief of the Trans-Mississippi Department. At the close of the war he became in succession architect and civil engineer, and was for five years professor of mechanics at the Virginia Mechanics College.

BOILERS. During the year three vertical water tube boilers of the Stirling type rated at 2365 horsepower at 10 square feet of boiler heating surface per horsepower, were installed in the electric generating station of the Detroit Edison Company and were under tests for efficiency during a period of six months. These boilers were specially designed to secure a saving of fuel, and general economy of steam production, and the combined efficiency of boiler and furnace was stated at from 76 to 80 per cent. The tests made were unusually thorough, and involved the weighing and measurement of 5000 tons of coal and 45,000 tons of water. These boilers consist of three top drums and two bottom drums, connected by four groups of tubes. The furnace is 14½ feet by 26 feet, with a grate area of over 400 feet, forming an effective boiler heating surface of 23,654 square feet. One of the boilers was fitted with Roney stokers and another with Taylor stokers. So large and important was this installation that a report on the tests made by Prof. D. S. Jacobus and presented to the American Society of Mechanical Engineers was one of the most important papers in this field printed during the year in its *Journal* (November, 1911). See also the article **BATTLE-SHIPS**.

BOILER EXPLOSIONS. The annual statistics

of boiler explosions in the United States for 1911 were compiled and published in *The Locomotive*, published by the Hartford Steam Boiler Inspection and Insurance Company. The number of explosions during the year was 504, involving the deaths of 223 persons and injuries to 420, or total casualties of 643. In 1879-1911 10,569 explosions have been recorded, involving the deaths of 9444 persons and injuries to 14,613, or a total of 24,057.

BOKHARA. A Russian vassal state in central Asia. Area, 83,000 square miles; population (1910), about 1,500,000. Capital Bokhara, with about 75,000 inhabitants. The ameer, Sayid Mir Alim Khan (born 1880), succeeded his father January 5, 1911. The Russian political agent (1911, Al. S. Somov) resides at Bokhara.

BOLAMA, ISLAND OF. See **PORTUGUESE GUINEA**.

BOLIVIA. An interior republic of South America. Sucre, the seat of the supreme court, is usually regarded as the capital; but the president resides at La Paz, where for a number of years the congress has held its sessions and the foreign diplomats reside.

AREA, POPULATION, ETC. The country consists of eight departments and two territorial divisions. At the close of 1910 the Congress authorized the erection of an additional department in the region of the upper Paraguay River, to be known as Los Chiquitos. Largely on account of the boundary disputes with Peru and Brazil, now in course of settlement, estimates of the total area differ widely; one estimate is 473,560 square miles; another, 567,600; a third, 605,400; and a fourth (given by the Pan American Union), 708,195. Estimates of population vary less than those of area since it is certain that vast regions, though little explored, are very sparsely peopled. The census of 1900 showed 1,744,568 inhabitants, and the estimate of 1908, 2,267,935. About one-half the population is Indian, and probably not more than one-eighth pure white. The great elevated plateau of western and central Bolivia, including some 40,000 square miles, contains most of the larger towns. On June 15, 1909, La Paz had 78,856 inhabitants; recent figures for other towns are: Cochabamba, 28,000; Potosí, 25,000; Sucre, 23,416; Oruro, 22,000; Santa Cruz, 20,535. Primary instruction is free and nominally compulsory. In 1910 there were 717 elementary schools, public and private, with 1299 teachers and 46,000 pupils; 18 secondary schools, with 126 teachers and 1631 pupils; and 17 institutions for superior instruction, with 65 teachers and 680 students. The state religion is Roman Catholicism.

PRODUCTION AND COMMERCE. Agriculture shows unsatisfactory development; crops include corn, rice, barley, and potatoes, but the vegetable product commercially most important is rubber. Bolivia depends mainly upon its abundant mineral resources, the chief of which are tin, silver, bismuth, and copper. In output of tin ore Bolivia ranks second in the world, the Straits Settlements being first.

Imports and exports are reported as follows, in thousands of bolivianos:

	1906	1907	1908	1909	1910
Imports	31,997	34,562	32,069	36,837	45,942
Exports	50,757	45,902	58,924	63,764	74,963

The leading imports include textiles, provisions, manufactures of iron and steel, and explosives.

The chief exports in 1909 and 1910 respectively were valued as follows in bolivianos: Tin, 31,654,109 and 37,006,503; rubber, 21,947,138 and 27,654,000; silver, 5,721,915 and 5,476,000; bismuth, 1,451,075 and 1,923,417; copper, 1,641,201 and 1,786,952.

Values (so far as available) of the trade with leading countries were as follows in 1909 (imports) and 1910 (imports and exports) in bolivianos:

	Imports 1909	Exports 1909	1910
United States	10,874,000	76,000	180,000
Great Britain	7,894,000	86,424,000	46,652,000
Germany	5,321,000	11,286,000	15,424,000
Chile	3,310,000	1,377,000	695,000
Peru	2,534,000
Argentina	1,691,000	727,000	400,000
Belgium	1,568,000	1,819,000	3,812,000
France	1,480,000	8,125,000	5,158,000
Brazil	2,575,000	2,467,000

COMMUNICATIONS. In the summer of 1911, there were in operation 1022 kilometers (635 miles) of railway, and construction was being carried forward to various points. There is communication by rail (and by steamer across Lake Titicaca) from the Chilean port of Antofagasta to Oruro, Viacha, La Paz, Guaqui, and the Peruvian port of Mollendo. Another line connecting La Paz with the Pacific, and running from Viacha to the Chilean port of Arica, was expected to be open to traffic in 1912 (Bolivian section, 208 kilometers). Other lines under construction in 1911 were: Río Mulato to Potosí, 170 kilometers; Oruro to Cochabamba, 200; Uyuni to Tupiza, 200; total length, including some others, 896 kilometers. Of this total, 206 kilometers were open to traffic and are included in the 1022 kilometers mentioned above.

Telegraph lines (reported 1911), 5007 kilometers (3111 miles), with about 125 offices. There are over 200 post offices.

FINANCE. Complete and final figures of revenue and expenditure are not available. Estimated ordinary revenue and expenditure: 1908, 15,925,375 and 16,617,500 bolivianos respectively; 1909, 13,300,000 and 16,454,625; 1910, 13,540,000 and 13,887,435; 1911, 13,141,175 and 17,805,859. The greater part of the revenue is derived from import and export duties. Public debt (1910)—external, £1,965,350; internal, 3,154,640 bolivianos; floating, 7,659,212 bolivianos.

On September 14, 1906, a law was enacted providing for the adoption of the gold standard. The monetary unit is the boliviano, worth 38.93 cents (12.5 to the pound sterling).

ARMY. In 1911, as a development of the reorganization of the army which was started in 1907, some German officers with Colonel Kundt at their head undertook the revision and reorganization of the administrative training. Service nominally is compulsory. On a peace basis a standing army was maintained at about 3500 men, but the addition of the reserves and the territorial guard would bring the war effective to over 88,000. The organization of 1911 consisted of five infantry battalions, a cavalry regiment, and a regiment of mountain artillery armed with Creuzot shielded guns, while preparations were being made for

raising a second cavalry regiment and a regiment of field artillery.

Bolivia during the year 1911 purchased from Schneiders, in Europe, three batteries of field guns of Spanish pattern.

GOVERNMENT. By the constitution of October, 1880, the executive authority is vested in a president, who, with two vice-presidents, is elected for a term of four years. He is assisted by a cabinet of six ministers. The legislative power devolves upon a congress of two houses, the Senate (16 members) and the Chamber of Deputies (75). The president in 1911 was Eliodoro Villazón (for the term beginning August, 1909); first vice-president, Macario Pinilla.

HISTORY. During the year the cabinet was reorganized. A new department was formed on the Upper Paraguay River, with Puerto Suárez as its capital. A plan of military revision and administrative reorganization under German direction went into effect. See paragraph above on *Army*.

BOLL WEEVIL. See COTTON.

BOOKS, PUBLICATION OF. See LITERATURE, ENGLISH AND AMERICAN.

BOOTS AND SHOES. This industry in the United States during the year 1911 was in a state of considerable uncertainty owing to tariff legislation, actual and proposed. It will be recalled that in the Tariff act of 1909 hides were placed upon the free list with the general approval of the boot and shoe interests. In the House tariff bill of 1911 boots and shoes which had enjoyed a duty of twenty per cent. were put on the free list, but hides, a raw material, received a duty. This bill was vetoed by President Taft, and in his message he called particular attention to this condition. The boot and shoe industry during the year was threatened also by governmental investigation, or at least rumors of such investigation were freely circulated, and the alleged monopoly of shoe machinery corporations was a further disturbing feature. The larger manufacturers vigorously denied that any trust or combination controlled their product, or that prices were unduly high. They claimed that tariff protection was necessary to maintain the standard of wages, and that they were threatened with competition from English and other European factories which would prove disastrous. During the year the price of hides advanced, and it was thought that boots and shoes would advance in price accordingly.

The extent of the boot and shoe industry in the United States was shown in the census report of 1910 published during the year. In this report it was stated that the annual output of American shoe factories was 247,643,197 pairs of boots and shoes. Of these 93,888,892 were men's shoes, and 86,595,314 pairs were women's shoes. In the year 1909 the sum of \$117,092,000 was paid in wages of some 200,000 wage earners, and the value of the product was stated at \$512,798,000.

The American shoe manufacturer was extending his sales in all parts of the world. In the fiscal year 1880, less than 400,000 pairs of boots and shoes were exported; in 1890, 600,000 pairs; in 1900, over three million pairs; in 1905, over five million pairs; in 1910, over seven million pairs, and in the calendar year which ended in December, 1911, the number exceeded

eight million pairs, to say nothing of the one million pairs going to Porto Rico and Hawaii. These figures relate to boots and shoes of leather; while if to this those of india rubber are added, an additional three million is obtained, bringing the total number of American made boots and shoes passing out of continental United States in 1911 up to an average of a million pairs per month, against about a half million per annum twenty years previously.

Foreign exports of boots and shoes from the United States were greater than ever during the year 1911, a total of over \$56,000,000 for leather and manufactures of leather, representing a gain of five or six million dollars over 1910. In this was included nearly \$18,000,000 worth of glazed kid, which represented a virtual increase of \$1,000,000 over the previous year. Boots and shoes were exported from the United States to no less than eighty-five countries and colonies in the world; the value of boots and shoes exported, which had never reached as much as a million dollars per annum prior to 1896, exceeded twelve million dollars per annum and in 1911 amounted to about fifteen million dollars in value, including those sent to non-contiguous territory in the United States; and if to this we add the value of india rubber boots and shoes exported, we should have a total of about seventeen million dollars for boots and shoes of all kinds passing out of continental United States in the year ending December, 1911.

The West Indies and the Philippines take more than one-quarter of the exports of the United States, Cuba being the best customer, with exports valued at \$2,698,000 for the ten months ending October 30, 1911. Canada was second with exports valued at \$1,800,000 for the same period.

The exports of boots and shoes to England continued to fall off. It was said that the British shoe business was in better shape than ever, due to the reorganization of many of the large plants, and the use of improved machinery such as was found in American factories. The British manufacturers were awaiting with interest any change in the tariff with the hope that with further advantages they could develop export business to the United States.

The United Kingdom was the chief rival of the United States in supplying boots and shoes to the world. Her exports of boots and shoes were still greater both in total number of pairs and total value than those of the United States, but the growth in her case was far less rapid than that of the United States. The number of pairs exported from the United States in 1895 was 965,196, and in 1910, 7,810,903; the number of pairs exported from the United Kingdom in 1895 was 8,095,440; and in 1910, 13,039,656; the percentage of gain, in the case of the United Kingdom being sixty-one per cent. and in the case of the United States, nearly seven hundred and ten per cent. The value of leather boots and shoes exported from the United States, however, was more nearly identical with that of like exports from the United Kingdom, having been in the calendar year 1910, \$13,216,237, against \$14,744,969 for the United Kingdom, the average price per pair of those exported from the United States having been \$1.69, against \$1.13 for those exported from the United Kingdom.

As indicative of the shoe business at a single

New England centre, it may be stated that at Brockton, Mass., the shoe shipments for 1911 were valued at \$54,005,462.50 and amounted to 19,648,350 pairs packed in 785,534 cases. The average wholesale price was \$2.75 per pair, which marked a gradual increase over the average of 1909 of \$2.60. The Brockton increase of production over 1910 was \$134,257.70. The wages in the factories in the same year aggregated \$12,077,585.25, or an increase in aggregate earnings of \$270,650.85 over 1910.

BORDEN, ROBERT LAIRD. A Canadian statesman, who became prime minister as the result of the Conservative victory in the elections of September, 1911. See *CANADA, History*. He was born in Nova Scotia, in 1854. He adopted law as a profession and became the recognized leader of the bar in Nova Scotia. In 1896 he was persuaded, much against his will, to become a candidate for Parliament and was elected as one of the members for Halifax. In his youth his affiliations had been with the Liberal party, but he later became a Conservative. During his first term in Parliament he spoke seldom and generally upon questions which had a legal aspect. His ability, however, soon came to be recognized and in 1901 following the defeat of Sir Charles Tupper, in 1900, he was the most prominent candidate for leader of the Conservative party. He had no ambition for the office, but was finally persuaded to accept it. The difficulties of the position were great. In Quebec he was obliged to meet the great personal ascendancy of Sir Wilfrid Laurier, while in the western provinces and in Ontario he was comparatively unknown. Early in his leadership arose the question of granting provincial constitutions to the western territories and the control of education as between the provincial and territorial authorities. In 1875, under the territorial constitution, the Roman Catholic minority had secured the right to maintain separate schools in the territories. The Laurier government determined to secure this right under the provincial constitution. Mr. Borden, however, took the position that, subject to the right of appeal to the federal government, the provinces had the exclusive control over education. The result of this attitude was to strain his relations with the Roman Catholic hierarchy and the French people of Canada. He was also severely criticised for his acceptance of the salary which the Laurier government had a few years before provided for the leader of the opposition. In the general election of 1904 he suffered a severe blow in the loss of his seat for Halifax. At this time every constituency in his native province declared against his candidates. He wished to resign and was disposed to withdraw altogether from public life. He was dissuaded from this, however, and consented to accept a seat in Ontario and to continue in the leadership of his party. At the general election of 1908 he recovered the seat for Halifax, and his party obtained six out of the eighteen Nova Scotia seats in the House of Commons. This greatly strengthened his position. His aggressive opposition to the measure providing for reciprocity between the United States and Canada is discussed in the political sections of those articles.

BORNEO. An East Indian island, belonging partly to Great Britain, partly to the Netherlands. Estimated area, 293,500 square miles; estimated population, 1,680,000. See *BRITISH*

NORTH BORNEO; SARAWAK; DUTCH EAST INDIES; and ANTHROPOLOGY.

BORON. See **CHEMISTRY.**

BOSNIA AND HERZEGOVINA. Provinces (since September 5, 1908) of the Austro-Hungarian monarchy. Area, 19,767 square miles. Population (mainly Serbo-Croatian) in 1895, 1,568,092; census of 1910, 1,931,802, of whom 1,898,044 constituted the civil population and 33,758 the military. Among the civil population there were in 1910 20,651 marriages, 77,343 births, 52,010 deaths. The Mohammedans numbered in 1910, 611,884; Servian Orthodox, 824,021; Roman Catholics, 433,480; Evangelicals 6247; Greek Orthodox, 8097; Jews, 11,850; others, 94. Sarajevo, the capital, had (1910) 51,919 inhabitants; Mostar, 16,392; Banjaluka, 14,800; Tuzla, 11,333. There were in 1909 434 elementary, 978 lower, and 92 reformed Mohammedan schools, five gymnasias, two realschulen, eleven advanced female and nine commercial schools. There are Mohammedan and other seminaries for religious instruction, besides normal, technical, and industrial establishments. Education, though free, is not compulsory.

The soil is fertile; but though agriculture occupies about eighty-five per cent. of the population it is in a low state of development, despite government encouragement. Besides cereals, tobacco (a government monopoly) is raised, as well as potatoes, flax, hemp, grapes, and sugar beets. Sheep and cattle raising and lumbering are carried on. Livestock (1895): 233,322 horses, 1,416,394 cattle 1,447,049 goats, 3,230,720 sheep, 662,242 swine. Mining, carried on mainly by the government, is important. Coal output (1909), 696,114 tons; iron ore, 120,069; manganese, 5692. Miners employed, 3244. Output of metals: 49,062 tons of raw iron (valued at 3,417,443 kronen); 22,307 tons of wrought iron (3,103,031 kronen); 2329 tons of cast-iron manufactures (493,832 kronen). Salt output, 22,128 tons (2,456,241 kronen). The two provinces are included in the Austro-Hungarian customs territory. Estimated imports (1909), 139,538,540 kronen; exports, 122,979,368. Export of cattle, 85,485 head; horses, 12,306; sheep, 89,308; goats, 53,461. Value of timber export, 29,642,781 kronen; wine, 458,197. Railway lines in operation January 1, 1911, 1956 kilometers; telegraph lines, 4102; wires, 12,778; offices, 173; telephone lines, 472; wires 8288. Revenue and expenditure for 1908, 66,487,959 and 66,482,018 kronen respectively; 1910 estimate, 74,376,409 and 74,251,960; 1911, 79,129,475 and 79,535,715. The provinces are administered through the Austro-Hungarian minister of finance (1911, Stephen (Baron) Burian von Rajecz).

BOSTON OPERA COMPANY. See **MUSIC.**

BOSTON UNIVERSITY. An institution of higher learning at Boston, Mass., founded in 1869. The students enrolled in all departments of the university in 1911-12 numbered 1274. The faculty numbered 161. The most important event in the history of the university during the year was the election of Lemuel Herbert Murlin, LL. D., president, to succeed William Edwards Huntington, LL. D. Rev. L. J. Birney, S. T. D., succeeded Samuel L. Beiler,

Ph. D., as dean of the School of Theology, and Alonzo R. Weed, acting dean of the School of Law, was chosen dean to succeed Melville M. Bigelow, LL. D., who still remains on the Board of Lecturers of Law. The Department of Agriculture, which was not organically related to Boston University, but was only in friendly affiliation, has now been entirely separated. To the general endowment there was added during the year \$400,000, and an addition to the hospital facilities in the Medical School was erected at a cost of \$250,000. The library contains about 35,000 volumes.

BOTANY. MEETINGS. The year 1911 was an active one in botanical fields. The American Association for the Advancement of Science met in Washington, D. C., December 26-30, with Dr. C. E. Bessey, professor of botany of the University of Nebraska, as president. Section G, Botany, had for its presiding officer Prof. F. C. Newcombe. The Botanical Society of America, with Dr. W. G. Farlow as president, the Phytopathological Society, with Dr. A. D. Selby as president, and the American Breeders' Association, with Hon. James Wilson, Secretary of Agriculture, as president, were some of the affiliated societies that met at the same time for the reading and discussion of botanical papers. The British Association for the Advancement of Science met at Portsmouth and the French Society at Dijon during the summer.

A bacteriological museum for the exchange of cultures has been established at the American Museum of Natural History. *Phytopathology*, a journal of plant disease, was established during the year. The legislation providing for an inspection of plants to prevent the introduction of plant diseases into this country failed of enactment by Congress last year. Canada, under recent legislation, has prohibited the importation of potatoes from Newfoundland and the islands of St. Pierre and Miquelon on account of the black wart disease. A plant disease inspection for nursery stock has been organized in France under the minister of agriculture. In Great Britain the Board of Agriculture controls this matter and it has proclaimed a number of diseases.

Investigators in the different fields of botany have issued many valuable contributions to botanical literature. A large number of papers of cytological, morphological, and taxonomic interest have appeared, and the activity in plant breeding, plant physiology, and plant diseases has been very great.

PLANT BREEDING. Shull has described the methods followed in hybridizing corn and emphasized the complex hybridity of many combinations that have been made. East and Hays have given an account of four years' study on inheritance in maize, which showed the behavior to be along strictly Mendelian lines. Collins has shown the increased stimulus of crossing corn. Emerson found in a study of F₁ and F₂ generations of beans that there was more complexity in size and shape of beans than in their color. Experiments with peas have been described by Vilmorin, Waugh, Shaw, and others, and Spillman has described the inheritance of color in cowpeas. Belling has reported on experiments in crossing velvet beans and Lyon beans. Andrews and Gates have each described twin hybrids in *Cenothera*. Shull has described some mutants of *Lychnis dioica*, and Saunders reports singleness dominant over

doubleness in petunias. Singles crossed with pollen from double-flowered petunias gave doubles in the first generation. Humbert has given the results of a quantitative study of over 7500 plants of *Silene noctiflora* to show the variation in pure lines. Salaman found in a study of potatoes that purple color in tubers is dominant to red and red to white. Crompton reported experiments with barley and Henry has found Mendelian segregations in various elms. Blaringhem called attention to work of Naudin on hybridizing various plants in 1861, from which he deduced principles applicable to all hybrids. Campbell made a study of the so-called graft hybrids of *Solanum* and found *S. darwinianum* to be the only one that is a hybrid in the strict sense.

STUDIES OF SOIL ORGANISMS. Much attention is being given to the study of soil organisms and to the assimilation of free atmospheric nitrogen. Conn, studying at Cornell University, found the bacterial content of some soils greater in the winter season than at other times, and that certain types appeared in numbers then that were less abundant at other seasons of the year. Kappen claims that bacteria are necessary for the reduction of calcium cyanamid and lime nitrogen before they are available for higher plants. Kellerman has described the different groups of nitrogen-gathering organisms and their relation to nitrogen in the soil. De Kruijff reports a new variety of *Torula* as capable of fixing free nitrogen. Krainski found the greatest amount of nitrogen fixation by soil organisms took place in damp but not wet sandy soils. Edwards says that *Pseudomonas radiculicola* retained its vitality for more than four years in cultures. There are many claims that plants other than leguminous ones can fix free nitrogen from the air, but Duggar and Knudson report studies of over 400 cultures of fungi, and only one species of *Aspergillus* indicated any fixation of nitrogen. Kövessi claims that Jamieson's theory of nitrogen absorption through special hairs on plants is incorrect. Greig-Smith claims the existence of bacteriotoxins in soils which influence plant growth. Heating such soils destroys the less resistant bacteria, dissolves the aggricere, and permits the more resistant species to multiply rapidly. Helene Krzemieniewska has found that potassium, calcium, magnesium, phosphorus, and sulphur are essential to the development of *Azotobacter*, and that potassium, sodium, and magnesium compounds beyond certain concentrations act injuriously.

PLANT PHYSIOLOGY. Willstätter, Marchlewski, and their students are continuing their studies on the nature of chlorophyll, and report additional analogies between the chemistry of chlorophyll and that of blood. Ivanowski believes that the decomposition of carbon dioxide takes place in a colloidal form of chlorophyll. Combes claims that the appearance of anthocyanin in plants is correlated with an accumulation of oxygen in their tissues. The variation in the amount of gas is regulated by chlorophyll activity. Keegan has stated that the red and purple coloring matter in leaves is probably correlated with a diminution in their albuminoids. As a result of a study of some 800 plants, Roshardt claims that the movement of water in plants is greatly assisted by the living cells. Schroeder has confirmed the existence in cereals of a selective permeable

membrane. Kuyper reports on the effect of temperature on limiting respiration and says that the harmful effects of increasing temperature rise with an increase in starch content and fall with an increase in protein. According to Lindet, dextrose in plants is associated with respiration and levulose with growth. Grafe has shown that formaldehyde can be assimilated by green plants, converting it into reducing sugars. The limiting factor of assimilation in plants is the internal temperature of leaves, provided the stomata are open and the temperature does not exceed 25° C., according to Thoday. By experiments under continual electric light, Dangeard has found that photosynthesis is practically confined to the principal absorption bands of chlorophyll. Stoklasa has found that ultraviolet rays greatly stimulate photosynthesis in etiolated plants, and that under the action of such light the synthesis of carbohydrates from carbon dioxide and nascent hydrogen can be brought about. Lubimenko claims that the red portion of the spectrum aids in the decomposition of carbon dioxide and the elaboration of the first products of photosynthesis, and that the blue violet rays are employed in the fixation of organic materials elaborated by the green cells. He also claims a definite light optimum for the production of dry matter by green plants. Usher and Priestley have repeated their investigations described a few years ago, and they claim that hydrogen peroxide and formaldehyde are the primary products of the photolysis of carbon dioxide. The liberation of oxygen from the peroxide is effected through the action of catalase.

A number of investigators have reported upon the sources of nitrogen in plants. Pantanelli and Severini and Kelley have shown that plants can directly utilize ammonium salts where nitrification is precluded. Priianishnikov claims that barley can form asparagin directly from ammonium compounds. Molliard says that plants can obtain their nitrogen from a number of organic nitrogenous compounds. Ravenna and others have found that hydrocyanic acid is a stage in nitrogen nutrition. Others have shown its presence in plants as a glucosid or otherwise. Maize has been found by Lefevre capable of assimilating amides under certain conditions. Richter found that translocation of elaborated material from leaves was closely associated with temperature conditions, and Harter from six to fourteen per cent. starch in dropped leaves in autumn. A large number of papers have shown the stimulating effect of various products on plant activity. Acqua showed that radium affected plants and parts of plants very differently. Roots are quite susceptible to its action, but aerial parts are less so. Photosynthesis and protoplasmic movement are not checked. Mazé claims that preliminary drying will stimulate immature seeds to germinate. Stoklasa found that small amounts of manganese and alumina stimulated photosynthesis. Schneider-Orelli says that *Medicago* seeds can stand dry temperatures of 100° C. for seventeen hours without being killed. Warthiadi found that a ratio of lime to magnesia of one to one gave the best results with cereals. The lime factor is said to influence grain production and magnesia that of straw. Lloyd in his study of the ripening of persimmons claims that the insolubility of tannin is due to its colloidal formation in the

ripe fruit and that carbon dioxid would hasten ripening, especially when present under pressure.

PLANT DISEASES. There has been great activity among investigators of plant diseases. Stone has described a number of diseases due to malnutrition. Molisch has reported upon injury to plants by tobacco smoke. Scott has found a spotting of stored apples due to arsenical sprays. Swingle and Morris have reported arsenical injury to apple and other trees. Several have found that the vapors and dust arising from tarred roads are injurious to plants. Pierre and Parish have demonstrated the injury by cement dust to various persistent leaved plants. Butler claims that the California vine disease is largely due to disturbances in water conduction.

Arthur, Klebahn, Fraser, and others have proved the alternate hosts for a number of additional heteroecious rusts. Pritchard has shown that wheat rust can pass from crop to crop as mycelium and rust pustules in seed, and Johnson shows that the timothy rust can winter over on the grass as far north as Washington, D. C. Freeman and Johnson have published an extensive study of the cereal rusts of the United States. Evans in South Africa found hybrid wheats more susceptible to rust than their parent stocks. Bolley has elaborated on his theory of soil infection and claims that the depreciating yields of grain are, to some extent at least, due to fungus infection from the soils, and he reports having found spores of a number of the most destructive parasites of cereals in soil where grain had been grown. Dr. E. F. Smith has published the results of six years' study of the crown gall of plants due to *Bacterium tumefaciens*, and he points out some analogies between the behavior of this disease in plants and cancer in the human body. Hedgcock has studied the same disease in orchards and finds it widely spread, but its importance in established orchards, especially in the eastern part of the United States, he believes is overestimated. Barre, Edgerton, Lewis, and others have proved conclusively that the cotton anthracnose is carried over in the seed. The wart disease of potatoes (*Chrysophyctis* or *Synchytrium endobioticum*) continues to attract much attention in Europe, especially in England, where marked differences in the susceptibility of varieties are reported. The disease has been reported in Newfoundland, but has not yet been found in the United States. In Germany much study is being given to the leaf-roll disease of potatoes, and it seems probable that several diseases due to different causes are confused under this name. Appel and Wollenweber are making a study of the Fusariums, and it is probable that a form of leaf roll is due to some species of this genus. Vafha claims that it is due to a fungus, which he has named *Solanella rosea*. Griffon claims that a number of wet rots of vegetables are due to *Bacillus fluorens* and that a number of bacteria that have been described as connected with these troubles all belong to the same species. Higgins claims that the cotton wilt is due to *Fusarium vasinfectum* and not to *Neocosmospora*, as has been reported. Fawcett, Berger, and others have shown that the gummosis of citrus, plum, and peach trees is due to *Diplodia natalensis*, an organism first described from South Africa and recognized in

Florida and elsewhere. Much attention is being given at home and abroad to diseases of timber trees.

The chestnut bark disease (*Diaporthe parasitica*) is just now giving much concern in the eastern part of this country. The State of Pennsylvania has appropriated \$275,000 for its eradication, and Congress gave \$5000 for a study of the situation. Clinton claims that drought and cold winters aid in making the trees more liable to attack. In Europe a black canker of chestnut trees has become of importance, especially in the south of France and neighboring countries. It is believed to be due to a species of *Melanconis*. The oak mildew in southern Europe continues important, but the true relationship of the fungus is still unknown. Spaulding has given an account of the introduction of the white pine blister blight (*Peridermium strobi*) into this country from Europe on imported pine seedlings. It is thought that all the diseased material has been traced and destroyed. It had found its way into about a dozen States and Canada.

Studies have been reported of diseases of a number of tropical plants of economic importance. Johnson claims that the bud rot of coconuts is caused by *Bacillus coli*, or a form indistinguishable from it by the present methods of research. Essed claims that the Panama disease of bananas is due to *Ustilaginoidella musæperda*. Rorer has described *Bacillus musæ* as causing a similar disease in Trinidad. Others claim that the diseases are due to species of *Fusarium*. Petch has described a canker disease of Para rubber, root diseases of rubber, tea, black wattle, etc. Butler has found a disease of palms in India which he attributes to *Pythium palmivorum*. Bessey has described nematode diseases of plants, more than 450 species of plants being listed as liable to attack.

Newly recognized diseases of plants have been described as follows: Edgerton, two diseases of figs; Scott, a new fruit spot of apples associated with arsenical injury; Hedges, a gall-producing fungus on oranges and limes; Salmon, a new disease of mangolds; Smith, a cottony mold of lemons; Manns, two new cabbage diseases; Fawcett, a stem end rot of oranges; McCulloch, a bacterial disease of cauliflower; a new bacterial disease of tomatoes in Italy; a foot rot of asparagus in the same country; a serious disease of coffee in Java; a cotton disease called curly leaf in Africa.

THE CONTROL OF PLANT DISEASES. Investigations are in progress for the control of plant diseases in many countries. In Vermont a twenty-year experiment in spraying potatoes with Bordeaux mixture has been concluded and an average yearly gain of sixty-four per cent. due to the spraying is reported. In addition to protecting the plants against fungi, they were stimulated to greater production. Experiments in Michigan and New York have shown that Bordeaux mixture is a specific for the prevention of grape black rot. That injury is liable to follow the use of Bordeaux mixture under some conditions has been known for several years. Groth claims that in the case of peaches it is due to an excess of carbon dioxid evolved by the leaves, resulting in a greater solution of the copper. Ballou claims that injury to apple trees is inversely proportional to their vigor. McAlpine recommends a special formula

in which the amount of copper sulphate is greatly reduced. In seeking for a substitute for Bordeaux mixture a number of chemical compounds and mixtures have been tested, and the lime-sulphur mixture, first used against scale insects, has been found to have remarkable fungicidal effects. It can be safely used on peach trees and for the prevention of most apple diseases. Scott advocates its use for the control of peach diseases and for apple scab, fruit and leaf spot, and rust, but for bitter rot Bordeaux mixture still gives the best results. Under certain conditions, especially when used with some arsenicals, some injury has been noted. In France dilute solutions of nitrate of silver are successfully employed, especially against the downy mildew of the grape. Stevens has described a method for the control of a lettuce disease due to *Sclerotinia*. From Italy comes the suggestion of the use of sand in tobacco seed beds for controlling the root rot. Volck reports the inefficiency of all the common fungicides for the control of apple mildew in California.

BIBLIOGRAPHY. A few of the books or larger botanical contributions that appeared in 1911 are given herewith. Several parts each of *Natürlichen Pflanzenfamilien, Das Pflanzenreich*, and *North American Flora*. C. S. Sargent, *Trees and Shrubs*, vol. II, pt. III; W. L. Jepson, *Silva of California*; J. H. Maiden, *A Revision of Eucalyptus*; R. C. Punnett, *Mendelism*; H. Lang, *Theorie und Praxis der Pflanzenzucht*; A. D. Darbyshire, *Breeding and the Mendelian Discovery*; L. BOURBON. See **RÉUNION**.

BOUTHILLIER-CHAVIGNY, CHARLES MARIE CLAUDE, Marquis de. A French lecturer and educator, died July 11, 1911. He was born in Paris in 1857. He removed to Canada when he was about 25 years of age and for twenty-two years lectured throughout the province of Quebec on topics of educational interest. About three years previous to his death he removed to Boston and there became prominent as a lecturer. He had received the appointment to a professorship at Harvard University, to take place in the fall of 1911.

BOVINE TUBERCULOSIS. See **VETERINARY SCIENCE**.

BOWDITCH, HENRY PICKERING. An American physiologist, died March 13, 1911. He was born in Boston in 1840 and graduated from Harvard College in 1861. In the same year he enlisted in the Federal army and served throughout the Civil War, rising to the rank of major. From 1868 to 1871 he studied physiology in France and Germany. He was assistant professor in the Harvard Medical School from 1871 to 1876, professor of physiology from 1876 to 1893, and was George Higginson professor of physiology from 1903 to 1906. From 1883 to 1893 he was dean of the Medical School. He

was a member of many learned societies, both American and foreign. His published writings include *The Growth of Children* (1877); *Hints for Teachers of Physiology* (1899); *Is Harvard a University?* (1890), and *Advancement of Medicine by Research* (1896). He also contributed many papers on physiological subjects to medical journals.

BOWDOIN COLLEGE. An institution of higher learning at Brunswick, Me., founded in 1794. In 1911-12 there were 333 students enrolled in the academic department and eighty-three in the medical department. The academic faculty numbered twenty-five, and the medical fifty-three. The productive funds of the college amounted to \$2,126,832. The total income in 1910-11 was \$129,645. The library contains about 100,000 volumes. The president is William DeWitt Hyde, D. D.

BOWLING. The eleventh annual tournament of the American Bowling Congress was held at St. Louis, January 27 to February 7. The individual championship was won by J. Blouin of Chicago (681). M. Knox of Indianapolis (670), finished second, and O. Lange (656) of Watertown, Wis., third. The two-men team contest was won by W. Hartley and L. Zeiler of East Liverpool, Ohio, who rolled 1246. In the five-men team event, the Flenner of Chicago won with a score of 2924. The all-event (nine games), was won by James Smith of Buffalo, who made a total of 1919.

The fifth annual tournament of the National Bowling Association was held at Buffalo, February 25 to March 18. The winners and scores were: Individual, Joseph West, London, Ontario, 694; two-men team, Kelsey-Johnson, New Haven, 1355; five-men team, Bonds of Cleveland, 2969. This five-men score breaks the record of 2962 pins made by the Lipmans of Chicago in 1909. The two-men team score also established a new record.

BOXING. The passing of the Frawley bill by the New York legislature was responsible for an unusually large number of boxing bouts in and about New York City during 1911. There was much trouble at the outset in enforcing the law, and the first contest held in Madison Square Garden was accompanied by considerable disorder. The boom in the sport in New York spread throughout the country, and more boxing contests were held than in any previous year. No new champions developed, however. "Jack" Johnson remained supreme in the heavy weight class, "Ad" Wolgast in the light weight class, and Johnny Coulon in the bantam class. The welter weight throne is vacant, as are those of the middle weight and light heavy weight classes. Johnson failed to box during the year. The showing made by other heavy weights was not good enough to indicate that the negro will have much trouble in defending his title for at least another year. The most promising white heavy weight developed during the year was James Flynn of Pueblo, Colo.

The boxing championships of the Amateur Athletic Union were held at Boston on April 10. The results of the final bouts were: 105-pound class, John J. Fallon of Roxbury, Mass., defeated Frank Brogan of Lawrence, Mass.; 115-pound class, Thomas Reagon of East Boston, Mass., defeated W. Adams of Toronto, Canada; 125-pound class, Frank Hufnagel of Brooklyn, won by default. A. Kaufman of New York, breaking his hand in the semi-final; 135-pound

class, James Jarvis of New York, defeated Frank McGarry of New York; 145-pound class, John Fisher of New York, defeated "Ted" Hodgen of Somerville, Mass.; 158-pound class, Napoleon Boutillier of Boston, defeated John H. Craige of Philadelphia; heavy weight class, John Severin of Boston, defeated Joseph Burke of Boston.

BOYCOTT. DANBURY HATTERS' CASE. This began in 1902 when a strike was ordered in the shop of Loewe & Company at Danbury, Conn., for the purpose of maintaining the closed shops. After various stages the case reached the Supreme Court of the United States in 1908, which declared a boycott illegal under the anti-trust law and authorized the company to sue for damages under that law. This suit was brought in the United States Circuit Court in Connecticut in 1909. The judge ordered the jury to file a verdict for the plaintiff, leaving the jury the sole function of determining the amount of damages. In February, 1910, the jury placed the damages at \$74,000, an amount which would be trebled by the provisions of the anti-trust law. This fine was then levied upon the individual union members, their property being attached to guarantee payment. This decision, had it been allowed to stand, would have been one of the most severe blows ever given labor unions in this country. It rendered all individual members by virtue of their membership liable for the acts of agents of the union, trade unions being unincorporated bodies.

The case was taken to the United States Circuit Court of Appeals. This court reiterated the opinion of the Connecticut Supreme Court that a boycott which prevents a manufacturer from producing goods for interstate trade, or which prevents his customers in other States from selling or purchasing his articles, is an obstruction of interstate commerce and therefore a violation of the Sherman law. But on the point of the responsibility of the individual members of a trade union for the acts of the union's agents, the position of the lower court was reversed. Justice Lacombe, who wrote the decision, declared that the mere fact of membership is not of itself sufficient to render the individual members responsible for the illegal acts of their agents. He held that the question of whether the defendants had made themselves responsible by their express or tacit approval of such acts should be submitted to the jury. This decision protects sufficiently the thrifty members of trade unions from danger of loss of property as the result of the actions of trade union officials; only when directly connected with a boycott conspiracy can they individually be sued for damages.

The American Anti-Boycott Association repaid to the American Federation of Labor \$5348, the costs of the appeal to the Circuit Court of Appeals. It then asked that the case be retried in the Circuit Court in Connecticut.

SECONDARY BOYCOTT. American courts have very generally taken the position that a secondary boycott, that is, a combination against a second party to compel a third party to do something which he does not wish to do, or to restrain from doing something which he wishes to do, is illegal. This position was the basis of an injunction issued in January, 1911, by Judge Blackmar of the New York Supreme Court against the United Brotherhood of Carpenters

and Joiners of America, and the Amalgamated Society of Carpenters and Joiners of America. These unions in the process of extending their control by an almost nation-wide movement, had endeavored unsuccessfully to unionize the shops of the Newton Company of Brooklyn. They then notified the builders of New York City and elsewhere where the product of this company was sold, that Newton Company material would not be handled, except under strict union conditions; they then proceeded to call strikes against those builders who used the company's material. The by-laws of the unions imposed fines upon members who worked upon materials produced by non-union carpenters. So extensive was this movement that 200,000 union carpenters were opposed by the associated plaintiffs who supported the Newton Company. This status, however, had been preceded by strikes and boycotts, a number of which were successful in forcing employing carpenters and builders to bind themselves not to use material produced by non-union labor. Judge Blackmar granted a permanent injunction restraining the unions from ordering such strikes, holding that, although strikes are in themselves lawful, a combination constituting an attempt to boycott was illegal. The case was then taken to the Circuit Court of Appeals, where Judge Coxe affirmed the injunction because "the right of every American citizen, whether employer or employee, to gain an honest livelihood by his own toil and endeavor is inherent in our organic law, and should be protected by all the power of the government." He held that an injunction against a strike is not the same thing as a condemnation to involuntary labor, or to labor under conditions deemed unfair. On the contrary, an injunction against a strike to enforce a secondary boycott gives a guaranty of the protection of the law to those willing to work and satisfied with their conditions of employment. The question involved in this case was not a matter of just or unjust conditions of employment, but the more fundamental question of the right to labor as a non-unionist and the right to carry on business under non-unionist conditions.

For the cases growing out of the famous boycott against the Buck's Stove and Range Company, see **LABOR, AMERICAN FEDERATION OF.**

BOYNTON, GEORGE B. An American soldier of fortune, died January 19, 1911. Although he went under the name of Boynton during his life, it was known that was not his proper name. He was born in New York City in 1842. He early showed indications of an adventurous disposition and was about to enter the United States Naval Academy at the outbreak of the Civil War. He enlisted, but his discharge was bought by his father. He was sent to an uncle in Illinois and enlisted in a cavalry regiment there. He took part in several engagements and was severely wounded. He left the army and narrowly escaped lynching as a Copperhead. He was later sent to capture contraband goods sent from Cincinnati, and on this expedition captured Belle Boyd, the famous Confederate woman spy. In the latter days of the war Boynton purchased a vessel with which he successfully ran the blockade from Bermuda to Southern ports. At the close of the war he joined James Fisk, the notorious financier of New York City, in the purchase of a distillery. This promised to be a successful enterprise, but

Boynton yielded to his love of adventure and became a filibuster in the Ten Years' War in Cuba. In this he several times narrowly escaped capture. In 1868 he began to supply the Spanish pretender, Don Carlos, with arms from England. The latter paid him £28,000, and then is said to have plotted to have him killed and robbed. He was warned in time and escaped. In 1870 he supplied arms from New York to Guzmán Blanco, president of Venezuela. For many years he was chief of Blanco's secret service. He secured leave of absence and re-organized the army of Santo Domingo. While there he was captured by the insurrectionists and sentenced to be shot. His life was saved only by the sign of a secret order to which he belonged. After quiet was restored in Venezuela he fitted out a vessel with Francis Lay Norton, another adventurer, and went to Chinese waters to prey on pirates. While in the waters about Borneo and the Malay Peninsula, he protected several vessels against pirates. In 1879 he again returned to South America where in the war between Chile and Peru and Bolivia he ran the blockade and delivered a cargo of munitions of war at Lima, Peru. He afterwards took part in the revolution in Haiti. In 1890 he was engaged by President Floriano of Brazil to blow up the *Aquidaban*, the flagship of Admiral Mello, leader of the insurrection. This was to have been done with a dangerous torpedo which he had invented for use against the Chinese pirates. His vessel was flying the British flag and after his plans were all made he was captured by the British ship, *Sirius*. He set up the defense that Mello was a pirate, but was kept a prisoner of war on the United States ship *Charleston*, for two months. At the end of this time he was sent to the Brooklyn Navy Yard and released. In 1895 he became chief of the secret service for President Crespo of Venezuela and was at the same time general manager of the Orinoco Corporation with vast concessions. In 1907 he returned to New York and was arrested for having in his possession dies for counterfeiting Venezuelan coins. His associates escaped punishment on the grounds that they were financing the revolution, but Boynton was sent to Blackwell's Island. He was, however, pardoned by President Roosevelt after serving three months. From this time until his death, Captain Boynton lived quietly in New York City. In addition to his adventurous career in real life, Boynton figured in fiction. Richard Harding Davis utilized much of the material given him by Captain Boynton in several of his works, and he was the hero of *The Beautiful White Devil*, by Guy Boothby. What purports to be the real story of his life was published in 1911.

BOY SCOUTS OF AMERICA. This organization, which has had a remarkable growth since its beginning in 1908, has for its general purpose the training of boys between the ages of twelve and eighteen years in self-reliance, manhood, and good citizenship. The idea for such a movement was originated in England by General Sir Robert Baden-Powell, and almost at the same time the scout idea sprang up in America. Two similar organizations, founded respectively by Daniel C. Beard and Ernest Thompson-Seton were combined under the general title, Boy Scouts of America. The aim of the Boy Scouts is to supplement the various existing agencies for education and to

promote the ability of boys to do things for themselves and for others. The important factor in the formation of bands of scouts is the scoutmaster. He must be a person of influence and possess those qualities which boys respect. The scoutmaster has general charge of the organization and training of the Boy Scouts. During 1911, 4680 new scoutmasters were commissioned, making a total of 6000 men, who voluntarily gave their services as scoutmasters and assistants. In 1911 264 local councils for scouts were organized and 153 scoutmasters were appointed. These officers gave all or part of their time to the movement. In the summer of 1910 the organization was perfected and a committee on permanent organization was appointed. This committee invited men of national reputation and with experience in other organizations to serve as members of the national council, which, through an executive board, was given full power and authority to direct the movement. The chairman of this committee is Ernest Thompson-Seton. The total number of local councils at the end of 1911 was 264. These councils are composed of prominent men in the respective neighborhoods, including representatives of different creeds and sects, as well as all organizations dealing with boys.

An analysis of the application blanks of 1500 scoutmasters shows 463 clergymen, 110 teachers, 76 students, 74 superintendents of schools, 41 lawyers, and 40 physicians. The officers of the Boy Scouts in 1911-12 were as follows: Honorary president, William H. Taft; honorary vice-president, Theodore Roosevelt; president, Colin H. Livingstone; chief scout, Ernest Thompson-Seton; national scout commissioners, Daniel C. Beard, Adj.-Gen. William Verbeck, and Col. Peter S. Bomus; treasurer, George D. Pratt. Another organization known as the American Boy Scouts has no connection with the Boy Scouts of America.

BRACKETT, ANNA CALLENDER. An American educator, died March 18, 1911. She was born in Boston in 1836 and graduated from the State Normal School in Framingham in 1856. After some experience in teaching she returned to that institution as a teacher. In 1859 she became vice-principal of the Girls' High and Normal School of Charleston, S. C. At the outbreak of the Civil War she returned to the North and became principal of the City Normal School of St. Louis, where she remained for nine years, doing effective work. In 1872 she established a school for girls in New York City. This school was the first in New York to demand from every student some study of Latin. It was also the first to place German in the regular course of study. In addition to her professional work she was engaged in writing on educational and other topics. In 1874 appeared her *Education of American Girls*. Two years before she had published a translation of Rosenkranz's *Pedagogies* under the title *Philosophy of Education*. This was revised and reprinted in 1886. She made a translation of Hegel for her own use. She wrote many poems, which appeared in leading journals and magazines. She was for years an important contributor to the *New York Nation*.

BRADFORD, AMORY HOWE. An American Congregational clergyman and editor, died February 18, 1911. He was born at Granby, N. Y., in 1846, and graduated from Hamilton

College in 1867. After graduating from Andover Theological Seminary, in 1870, he took a post-graduate course at Oxford. He was ordained to the Congregational ministry in 1870 and in the same year became pastor of the First Church of Montclair, N. J. He occupied this pastorate until shortly before his death. From 1892 to 1899 he was associate editor of the *Outlook*, and during 1892-3 was lecturer at Andover Theological Seminary. He was first secretary and second president of the American Institute of Christian Philosophy. In 1896 he was a member of the deputation sent by the American Board of Commissioners for Foreign Missions to inspect missions in Japan. In 1901 he was moderator of the National Congregational Council and in 1904 was president of the American Missionary Association. Dr. Bradford was a notable figure in the councils of the Congregational church in the United States and Europe. Among his published writings are *Spirit and Life* (1888); *The Pilgrim in Old England* (1893); *Heredity and Christian Problems* (1895); *The Sistine Madonna* (1897); *The Art of Living Alone* (1899); *The Age of Faith* (1900); *Messages of the Masters* (1902), and *Ascent of the Soul* (1902).

BRADFORD, GAMALIEL. An American publicist and banker, died August 21, 1911. He was born in Boston in 1831 and was the fifth of the name in regular succession. He was descended in the eighth generation from William Bradford, governor of Plymouth colony. He prepared for college in the schools of Boston and graduated from Harvard College in 1849. He entered the banking house of Blake Brothers and Company, Boston, and in 1858 was admitted as a partner. He retired from active business in 1868 and devoted himself to the study of political science and theory and practice of modern popular government, especially in its relation to the United States in federal, State, and municipal government. Before the Civil War he took an active part in the anti-slavery movement. In 1880 he became more interested in municipal and State governments and paid much attention to the Boston city charter of 1885 and the New York City charter in 1884. Mr. Bradford was independent in politics. He acted with the Republican party until 1884, when he left it because of its nomination of James G. Blaine for the presidency. Thereafter he acted with the Democratic party. After the Philippine Islands had been ceded to the United States by Spain he became an anti-imperialist and was an active protestant against the policy of the government toward the people of the islands. In 1901 he was a candidate for governor of Massachusetts, but failed to receive the nomination. He failed again in 1902. His issues were trusts, imperialism, and foreign alliances. Shortly after this he retired from active participation in politics. He was the author of *The Lesson of Popular Government* (1898). He also wrote many monographs and contributed articles to periodicals and newspapers.

BRADY, FRANCIS XAVIER. An American Roman Catholic clergyman and educator, died March 13, 1911. He was born near Gettysburg, Pa., in 1857. In 1873 he entered the Society of Jesus. He studied philosophy and science at Woodstock College, Maryland, from 1876 to 1879, and theology from 1884 to 1886. From 1879 to 1881 he was professor in Gonzaga Col-

lege, Washington. He was ordained a priest in 1886 and from that year until 1892 he edited several religious periodicals and was director of the Sacred Heart League of the United States. From 1892 to 1895 he was vice-president of Loyola College, Baltimore, and from 1895 to 1908 was pastor of St. Ignatius's Church in that city. From 1908 to the time of his death he was president of Loyola College. He was author of *Life of St. Aloysius* (1887); *The Holy Hour* (1890); *Manual of Bona Mors* (1890), and *The Great Supper of God* (1901).

BRANDEIS, LOUIS D. See CONSERVATION.

BRANDY. See LIQUORS.

BRAZIL, UNITED STATES OF. The largest republic of South America. Capital and largest city, Rio de Janeiro.

AREA, POPULATION, ETC. The estimated area of the twenty states and federal district is 3,218,139 square miles. The census of 1900 showed 17,318,556 inhabitants. In addition, the Acre territory, acquired from Bolivia in 1903, has about 73,720 square miles and 65,000 inhabitants. The total estimated population in 1908 was 20,515,000. Estimates of municipal populations in 1910 (probably not very accurate) were: Rio de Janeiro, 1,000,000; São Paulo, 400,000; Bahia, 350,000 Pará (Belem), 200,000; Pernambuco (Recife), 150,000; Porto Alegre, 100,000; Ceará, 50,000; Manaus, 50,000. The census to be taken in December, 1910, was indefinitely postponed for lack of sufficient appropriations.

From 1820 to the end of 1910 immigrants numbered 2,831,186, of whom 1,254,871 were Italians, 733,647 Portuguese, 340,605 Spaniards, and 105,321 Germans. In the ten years 1890-99 immigration was 1,208,700; in 1900-09, 648,800. In 1907 there were 67,786 immigrants; in 1908, 94,695; in 1909, 85,416; in 1910, 88,564; of the last number, 30,857 were Portuguese, 20,843 Spaniards, 14,163 Italians, 5257 Turkish Arabians, 3902 Germans, 2636 Austro-Hungarians, and 2462 Russians.

Primary instruction, which is not compulsory (though nominally so in some parts of the country), has made considerable progress. In 1909 public and private primary schools numbered 11,147, with 565,922 pupils, and secondary schools 327, with 30,258 pupils. There is no real university, but various establishments offer some opportunity for technical and professional instruction. Roman Catholicism is the prevailing religion, but ecclesiastical equality obtains.

INDUSTRIES. Agriculture continues and will long continue the principal source of Brazilian wealth. The chief crop is coffee, grown in the states of Espírito Santo, Minas Geraes, and Rio de Janeiro, but mostly in São Paulo. Constant effort is made to maintain the price of coffee, by imposing an additional tax on exports over a certain amount, by encouraging consumption, and, in São Paulo, by prohibiting further extension of coffee plantations. The cacao crop is produced almost entirely in the state of Bahia, about half of the sugar in Pernambuco, and tobacco in various states, but especially Bahia. Other crops are cotton, rice, corn, yerba maté, and bananas. As an export product rubber, from the Amazon valley, ranks next to coffee in value. Cattle-raising is important in the south, in the states of Matto Grosso, Minas Geraes, Rio de Janeiro, and São Paulo. The mineral resources are considerable, but for the most part little developed. A gradual increase

is shown in manufactures, of which by far the most important at present is cotton textiles.

COMMERCE. The values of imports and exports of merchandise have been as follows:

	1908	1909	1910
Imports.....	\$173,017,849	\$179,690,125	\$235,574,837
Exports.....	215,266,136	308,331,829	310,006,438

The leading imports include iron and steel manufactures, machinery, railway materials, cotton manufactures, flour, coal, wine, arms and munitions, codfish, kerosene, jerked beef, and paper. Values of principal exports:

	1908	1909	1910
Coffee	\$111,740,270	\$161,922,682	\$127,212,875
Rubber	57,155,489	91,578,388	124,400,714
Yerba maté.....	8,004,154	8,025,333	9,575,550
Hides	6,384,555	8,812,660	8,626,966
Tobacco	4,080,257	6,443,681	8,048,925
Cacao	9,590,666	7,739,870	6,824,139
Cotton	999,868	2,861,662	4,440,372
Sugar	1,482,146	3,247,504	3,499,732
Skins	3,414,987	4,709,492	3,463,569
Bar gold		2,252,898	1,954,674
Manganese ore		1,730,311	1,887,747
Bran		1,210,572	1,813,895
Carnauba wax		1,230,038	1,421,910
Nuts		1,493,712	1,408,286
Cotton seed.....		711,401	639,725
Monazite sand		708,092	631,251
Gems.....		238,212	49,059

By quantity the leading exports were as follows in 1908, 1909, and 1910, respectively: Coffee, 12,658,457, 16,880,696, and 9,723,738 bags (of 60 kilos, or 132.27 pounds, each); rubber, 38,206, 39,027, and 38,547 metric tons (2204.6 pounds each); yerba maté, 55,315, 58,017, and 59,360; hides, 30,412, 35,784, and 34,059; tobacco, 15,264, 29,782, and 34,149; cacao, 32,956, 33,818, and 29,158.

Trade by countries in thousands of dollars:

	Imports		Exports	
	1909	1910	1909	1910

SHIPPING. In 1909 there entered 5016 foreign vessels of 12,422,515 tons (8,239,330 British, 2,623,619 German, and 1,224,524 French); in 1910 5509 of 13,591,515 tons (of which 360 of 193,817 tons); in addition, in 1910, 16,834 Brazilian entries of 7,813,659 tons (of which 5263 of 229,205 tons sail). American entries in 1910 were eight vessels of 8129 tons.

COMMUNICATIONS. The railway mileage reported as in operation at the end of 1909 was 12,183, of which 6080 miles were owned and operated by the federal government, about 2450 were under federal concession and control, and 3653 were controlled by state governments. During 1910 1189 miles were opened to traffic, of which 180,913, and 96 miles respectively were added to the several systems. The total mileage increased from 9510 in 1901 to 13,372 at the end of 1910. The most important extensions in 1910 were between São Paulo and Rio Grande do Sul, thereby connecting Rio de Janeiro and Montevideo. The rail distance between the cities is 1967 miles, of which 1615 miles are in Brazil.

Much of the railway of Brazil is narrow (1 meter) gauge, and new construction included 186 miles on the Brazil North-Eastern, 100 miles on the São Paulo Southern from Santos to Santa Juquia. Progress was reported with 248 miles on the Sorocabano, and 235 miles of the São Paulo-Rio Grande line which extends from São Francisco on the Atlantic to the river Paraná, of which the first section is completed, and the Madeira-Mamoré line (to connect the navigable waters of those rivers, with a length of 214 miles) of which 94 miles had been completed at the beginning of 1911. Progress was also reported on the construction of the line from Igarapara in the state of São Paulo to Uberaba in the state of Minas Geraes, and the extension from Jupia, the terminus of the North-Western Railway, to Corumbá. Telegraph lines in 1909 aggregated 36,199 miles; wire, 73,124 miles. External communications were improved during 1911 by the completion of a trans-Atlantic cable (German), from Monrovia (Liberia) to Pernambuco; it was opened to use April 1. Post offices (1909), 3246.

FINANCE. Budget of 1911: Revenue, 85,048,528 milreis gold and 299,908,400 milreis paper; expenditure, 69,100,356 gold and 394,186,258 paper. The estimated expenditure included: Finance, 44,100,516 gold and 94,917,287 paper; communications and public works, 9,988,314 and 110,556,479; marine, 9,000,000 and 48,096,359; war, 1,300,000 and 74,476,983. Public debt as reported for December 31, 1910: Foreign, £87,286,317 and 240,000,000 francs; internal, 566,237,600 milreis paper; floating, 256,546,647 milreis paper; paper money in circulation, 621,005,255 milreis. The gold milreis is worth 54.6 cents and the paper milreis about 31 cents.

NAVY. As reported for 1911, the navy included: Two dreadnoughts, aggregating 38,500 tons; one old battleship, 5700; two armored coast guards, 6320; two monitors, 940; two scout cruisers, 6200; one protected cruiser, 3450; two second-class cruisers, 5840; three torpedo cruisers, 3090; one old gunboat, 800; one old destroyer, 500; ten new destroyers, 6500; two school ships, 4000. In addition there are several torpedo boats, river gunboats, transports, and dispatch boats. The two dreadnoughts, *Minas Geraes* and *São Paulo*, have each a displacement of 19,250 tons, 21 knots speed, a

battery of 24 12-inch and 22 4.7-inch guns; 500 feet between perpendiculars, 84 feet beam, 25 feet draft, and armor belt of nine inches maximum thickness. The *Rio de Janeiro*, under construction in 1911, will have a displacement of 27,500 tons and a main battery of 10 14-inch guns.

ARMY. The Brazilian army is organized on a basis of compulsory service from the ages of 21 to 44 under the terms of the law promulgated in January, 1908. The service required is two years with the colors, seven in the reserve, seven in the second line, four in the National Guard, and four in its reserve. The permanent army, which is maintained at a peace strength of about 30,000, consists of fifteen regiments of infantry, each of three battalions, twelve regiments of light artillery, fifteen 2-gun companies, nine regiments of cavalry, three independent regiments, ten squadrons for infantry brigades, scouting troops for the cavalry, and forty-five 4-gun batteries of field artillery, five 6-gun howitzer batteries, nine 4-gun horse batteries, 6 4-gun mountain batteries, siege artillery, fifteen ammunition columns, and engineers and railway transports. In 1910 the peace effective was 2167 officers, 346 surgeons and veterinarians, and 18,624 non-commissioned officers and men. There was also a corps of gendarmes aggregating 20,000 men, of whom 2486 were at Rio de Janeiro. Considerable interest was being manifested in the rifle club movement throughout the republic.

GOVERNMENT. The executive authority is vested in a president, who is elected for four years and is assisted by a cabinet of seven ministers appointed by and responsible to himself. The legislative power devolves upon a Congress of two houses, the Senate (63 members elected for nine years) and the Chamber of Deputies (212 members, three years). The president, vice-president, senators, and deputies are chosen by popular vote. The president for the term beginning November 15, 1906, was Affonso Moreira-Penna; he died in June, 1909, and was succeeded by the vice-president, Nilo Peçanha. The latter was succeeded on November 15, 1910, by Marshal Hermes da Fonseca.

BREMEN. See **GERMANY.**

BRETHREN, CHURCH OF THE, also known as the Dunkers or Dunkards. A religious denomination which includes a considerable body of Christians, whose faith and practice are not generally known outside of the localities in which they live. It had its origin in Germany in 1708, with Alexander Mack as its leader. Driven by persecution, bodies of worshippers came to the United States and settled first near Germantown, Pa., whence they spread to various sections of the country. Communicants recognize the New Testament as the rule of conduct, believe in the Trinity and hold faith, repentance, and baptism by triple immersion to be conditions of pardon and membership. Foot-washing is observed as a religious rite and is followed by an evening meal, which is called the Lord's Supper. The denomination includes three groups, the Conservatives, Progressives, and Old Order. The Conservatives are the most numerous and number about 100,000 communicants, 880 churches, and 3006 ministers. This body sustains ten colleges and one of the largest denominational printing houses in the

West, known as the Brethren Printing House at Elgin, Ill. Its official organ is *The Gospel Messenger*. The general conference of this body was held at St. Joseph, Mo., in June, 1911. During the latter part of the year four new missionaries were sent to India and six to China. Two elders were sent to Europe, one to take supervision of the mission in Denmark and Sweden, and the other to look after the work in France and Switzerland. At the general conference held in Des Moines, Ia., in 1908, the change of the name of the organization from German Baptist Brethren to Church of the Brethren was made. Dunker or Dunkard as a name is not recognized within the denomination. The general conference for 1912 will convene at York, Pa., June 4.

The Progressive Brethren in 1911 numbered 18,607, with 219 churches and 186 ministers. They maintain a college and publishing house at Ashland, Ohio. The Old Order numbers 4000 communicants, 75 churches, and 228 ministers. A small body known as the Seventh Day German Baptists numbers 240 communicants, 14 churches, and 9 ministers. It is found in the vicinity of Ephrata, Pa.

BREWERS' CONGRESS, INTERNATIONAL. See **AGRICULTURE.**

BRIAND, ARISTIDE. See **FRANCE, History.**

BRIDGES. There were few notable bridges in course of construction during the year 1911, as was the case also in the previous year. For small structures reinforced concrete continued in favor, and the variety of structures in which concrete figured increased. There were notable examples of single-arch bridges, such as the Risorgimento Bridge over the Tiber at Rome, and a 300-foot reinforced concrete bridge at Larimer Avenue, Pittsburgh, Pa., which was in course of construction during the year, and was the largest masonry arch in the United States, exceeding the 281-foot Monroe Street arch at Spokane, Wash.

QUEBEC BRIDGE. After the collapse in August, 1907, of the unfinished bridge across the St. Lawrence River at Quebec, considerable attention and discussion centred not only on the nature and causes of this disaster, but also on the decision of the Canadian government relative to a new structure. The failure of the bridge was examined most critically by a royal commission of three Canadian engineers, who discussed its shortcomings in an exhaustive report; and a new board was appointed which in 1910 announced an official design for the new structure. This plan involved a five-span bridge with two anchor, two cantilever and one suspended girder spans, each 586 feet in length. On this design bids were invited, and at the same time other designs were requested from bridge companies. The time allowed was but four months, and there was no compensation for the preparation of these plans, so that the conditions were not favorable to the best results. Nevertheless, twenty-four tenders were received, varying from \$11,000,000 to \$16,000,000, and eight or nine competitive plans. The outcome was the adoption of an independent design which was drawn up and submitted by a Canadian corporation, the St. Lawrence Bridge Company, providing for a structure with limited railway capacity and costing about \$9,000,000. This was to be a cantilever structure 1800 feet in the clear between the centres of the main piers. With the design for the Quebec bridge settled, the progress of

reconstruction was advanced rapidly. The three caissons required were constructed during the year, and two of these were sunk in place.

HELL GATE BRIDGE. The most important event in bridge building in the United States was the award to the American Bridge Company of the contract for the four-track Hell Gate Bridge of the New York Connecting Railways, designed by Gustav Lindenthal. This will bring the Long Island railway system into connection with the New York, New Haven & Hartford Railroad on the mainland. The design of this bridge included a main span of 1000 feet, which will be the longest and heaviest arch span in the world. The roadway, on which four railroad tracks will be laid, will be 140 feet above the water in the clear, while the top of the arch will be 265 feet above the water. The abutment towers will be of granite masonry and concrete, 200 feet in height. For the bridge alone 18,000 tons of steel will be required, and for the viaducts and other approaches for the whole structure, which will total some $3\frac{1}{2}$ miles in length, there will be required about 70,000 tons.

ST. LOUIS MUNICIPAL BRIDGE. During the year a large combined railway and highway bridge was being constructed across the Mississippi River between the cities of St. Louis, Mo., and East St. Louis, Ill. This bridge was formed by simple truss spans of the Pettit type, each with a length of 668 feet from centre to centre of the end pins. This extreme length of span was required by the United States War Department, which demanded that the length of span and height above high water must conform to those of the Thebes Bridge, the first existing structure south of the Eads Bridge at St. Louis, which was considered the dividing line between the upper and the lower river. The Thebes Bridge had a central span 650 feet in the clear, with a vertical clearance of 65 feet above the high water line of 1844; consequently, a revision of the span first proposed for the St. Louis Bridge was necessary and new plans were drawn giving three approximately equal spans of about 650 feet in the clear, and a height of 65 feet above the high water line of 1903. The bridge thus provided for, and in course of construction during the year, had two decks, the lower of which carried two steam railway tracks, while the upper supported two electric railway tracks on a 30-foot paved railway and carried two 6-foot sidewalks on cantilever brackets. The steel work consisted of nickel steel for the main truss braces, both tension and compression, and carbon steel for the secondary truss braces, railway and highway floor system, and for bracing and for minor details.

The bridge was built by the American Bridge Company and was erected on the falsework which was built on piling placed in the river bottom. This was permitted by the government on condition that one of the three spans should always be kept free for river traffic. After the falsework was arranged a traveler equipped with electric power was installed on the railway floor, and a smaller traveler on the stringers of the upper deck. Electricity was supplied by a power plant on the shore, and the material was rapidly riveted in position as it was delivered. The total weight of the three spans was about 13,935 tons. The pile driving for the east span was begun on May 9, 1911, and the falsework was finished on September 13 of the same year. The erection of the truss began immediately and

required about six weeks' time. The east channel was cleared on November 21. The trusses of the middle span were erected by December 6, and the west span was under erection at the end of the year, requiring but a few weeks for its completion.

Several important railway bridges were under construction in Canada during the year. The Canadian Pacific Railway Company made considerable progress with its bridge at Edmonton, and the high concrete piers to carry the steel structure will complete it, considerable work having been done on the structure itself. This bridge was 200 feet in height and 600 feet in length. At Entwistle, Canada, the Canadian North Railway was building a high bridge 200 feet in height and 600 feet in length over the Pembina River. A high-level railway bridge was also being constructed at Queen Street, Toronto, constructed by the Grand Trunk, Canadian Pacific, Canadian Northern, and the Toronto Railway.

EUROPEAN CONSTRUCTION. Few important bridges were built in Europe during the year 1911. In Great Britain a number of minor structures of reinforced concrete were under way. Of these the most important were the Warrington Bridge over the river Mersey, built on the Considere system with a single arch of 134 feet span and a width of 80 feet. At Blackburn a bridge of 40 feet span and 37 feet width was built over the Leeds and Liverpool Canal, while a ferro-concrete bridge of somewhat unusual design was built over the Stour River, 142 feet in length, with a width of 25 feet. It has six arches of three ribs each carried on five ferro-concrete pile piers. An important railway bridge was built by the Great Western Company over the Towry River at Carmarthen, consisting of five 50-foot fixed spans and a 50-foot rolling lift. This bridge was built on piers made of 7-foot cylinders in pairs, sunk by compressed air, one reaching to a depth of 300 feet.

RISORGIMENTO BRIDGE, ROME, ITALY. Gradually the construction of single arch spans of reinforced concrete had progressed, and in 1911 a record was made in the Risorgimento Bridge across the Tiber with a single span of 328 feet. The arch has a rise of 32.8 feet, and a total width of 65 feet 6 inches, affording a roadway 42 feet 6 inches wide and two sidewalks each 10 feet 3 inches in width. This design, which was submitted by Signor G. A. Porcheddo, the Italian representative of Messrs. Hennebique of Paris, was the only one proposed where three arches were not involved, and after careful consideration by a technical commission the plans were approved, and construction was begun November 11, 1909. The piers of this notable structure were built on foundations which had been formed by the "Compressol" system, where the subsoil was compressed by means of seventy-two concrete piers which had been formed by ramming deep holes by falling weights which were then filled with concrete and similarly rammed. These piers, widely and symmetrically distributed, provided immovable roots for the foundations upon which the bridge abutments were built. These were built in the form of ferro-concrete caissons of several compartments formed by partition walls, the longitudinal partitions serving as counterforts, and being connected menolithically with the vault of the arch and the spandrel walls which are continued up to the docking. The seven span-

drel walls are strengthened by transom partitions acting as wind bracing.

An interesting feature of the construction was the use of ferro-concrete instead of timber staging, and upon falsework so constructed the molds and centring necessary for the construction of the permanent arch were erected. The bridge was completed on April 11, and then received a severe series of tests, steam rollers, moving bodies of troops, and other static and dynamic loads being applied while the deflection was noted. The bridge withstood all tests satisfactorily, and was a feature of the Rome Exhibition, connecting as it did the artistic with the ethnographic portions. Signor Porcheddo, in recognition of his skill and engineering services, was created a knight commander of the Order of the Cross of Italy.

SITTER VIADUCT. The highest bridge structure in Switzerland was the Sitter viaduct on the Bodensee-Toggenburg, between St. Gall and Watwil across the Sitter River over a deep gorge. The total height of the viaduct is 1130 feet, and its middle space is crossed by a single steel truss 400 feet in length. The remainder of the structure consists of stone arches carried on stone columns of unusual height. The main stone arches are of 137 feet span, and the highest pier runs to a height of 330 feet, being 40 feet square at the base. There were also a number of smaller arches for the approaches. The steel truss was erected by means of a timber scaffolding, which was designed not only to support the weight of the truss itself, but also to resist strong wind pressure. The scaffolding carried an electric elevator and the machinery necessary for the construction of this part of the work. After the middle part of the bridge truss had been built to a length of 120 feet, the remaining distance on either side to the stone pillars was constructed by the use of a heavy traveling crane. This novel method of construction was found most successful, and the material hoisted from the valley below was then placed in position as needed.

TEES TRANSPORTER BRIDGE. The new transporter bridge across the river Tees in north-east England at Middlesbrough was formally opened for traffic on October 17 by Prince Arthur, son of the Duke of Connaught. This bridge supplants the former ferry boat service, and was constructed in preference to a tunnel or high-level bridge for a number of reasons independent of the high cost. The situation of the land on either side of the river made the difficulties involved in the approaches for either a tunnel or a high-level bridge practically insurmountable. Consequently, it was decided to erect two groups of piers on masonry foundations, and connect them by a pair of lattice-type-girders of 570 feet span, from which a traveling platform could be suspended. The under side of these girders is 160 feet above high water mark, and the depth varies from 65 feet from the towers to 21 feet at the centre. On the lower flange of each girder are two lines of rails spaced at distances of 35 feet from centre to centre. These four lines of rails support a traveling platform from which a car 44 by 39 feet is suspended. This car has passenger cabins and accommodations for 600 passengers and six vehicles and is suspended at a level with the roadway at each side of the river. The traveling platform on the rails is moved to and fro by an endless rope-way driven by a winch connected with two 60-horsepower Westinghouse motors. The working

of the car can be controlled from the pilot house on top of the passenger cabin, or in case of an emergency from the winch house on the shore. The main girders are of the braced cantilever type, and the extremities of the main span are anchored to concrete anchorage blocks by wire ropes embedded in concrete. In one of the two towers at each abutment there is a spiral stairway giving access to the main platform of the bridge which can be used as a footwalk. The cost of the entire structure was estimated at about \$409,000.

BRINCKERHOFF, WALTER REMSEN. An American pathologist, died March 2, 1911. He was born in 1875. After completing his medical studies he was appointed to the United States Marine Hospital Service and was the first director of the Leprosy Investigating Station in Hawaii. He served there from 1906 to 1910, when he was appointed assistant professor of pathology at the Harvard Medical School. In 1904 he was made a fellow of the Rockefeller Institute for Medical Research. In 1910, with his associates, he succeeded in isolating the leprosy germ and finding an artificial medium on which it would feed, at last paving the way for the eventual cure of leprosy by antitoxins.

BRINCKERHOFF, ROELIFF B. An American banker, philanthropist, and public official, died June 4, 1911. He was born in Owasco, N. Y., in 1828, and was educated in the common schools and in the Auburn and Homer academies. At the age of 18 he removed to the South and was for three years a tutor in the Hermitage, the home of President Jackson. Returning to the North, he studied law at Mansfield, O., and began practice in 1852. From 1855 to 1859 he was editor and proprietor of the *Mansfield Herald*. He enlisted in the Civil War as first lieutenant in the Sixty-fourth Ohio Volunteer Infantry and served throughout the war, attaining the rank of colonel in the quartermaster's department. He was made brigadier-general for meritorious service. At the close of the war he resumed practice until 1873, when he engaged in the banking business. He was active in prison reform work, and in 1880 was president of the National Conference of Charities and Corrections. In 1895 he was vice-president of the International Prison Conference in Paris and president of the American delegation. From 1884 to 1894 he was vice-president of the American National Prison Congress and in the latter year became its president. He was the author of *The Volunteer Quartermaster*, and *Recollections of a Lifetime* (1900).

BRISTOL. See NAVAL PROGRESS, *Propulsion*.
BRITISH ANTARCTIC EXPEDITION. See POLAR RESEARCH.

BRITISH COLUMBIA. A province (since July 1, 1871) of the Dominion of Canada. Capital, Victoria (population, preliminary returns census of June 1, 1911, 31,620). Area, 312,630 square miles; population (1911, final), 392,480. The lieutenant-governor (in 1911, appointed December 3, 1909) is Thomas W. Patterson. He is aided by an executive council of seven members (responsible ministry) and a legislative assembly of forty-two members. Premier in 1911, Richard McBride. See CANADA.

BRITISH DEVELOPMENT FUND. See AGRICULTURE.

BRITISH EAST AFRICA PROTECTORATE. A British dependency lying between the

Umba and the Juba rivers and extending inland to the Uganda Protectorate. Estimated area, 177,100 square miles; estimated population, 4,038,000, made up largely of Arabs and Swahilis on the coast, Bantu-speaking tribes, and Masai, Somalia, and Gallas in the interior. Asiatics number about 25,000; Europeans and Eurasians, 2000. Mombasa, the largest town (on Mombasa Island), has 30,000 inhabitants; Nairobi, the capital and the central station of the Uganda Railway, 14,000 (700 Europeans). Paganism prevails. There are government and mission schools; and Mohammedanism has gained much ground. Wheat and cotton growing are becoming increasingly important; and corn, rice, tobacco, hemp, rubber, etc., are cultivated. Important industries are ostrich, sheep, and dairy farming. Government timber lands are estimated to cover 2,000,000 acres. The mineral resources are negligible. Imports, 1909-10, £775,246; 1910-11, £1,000,348; exports, £590,057 and £962,911. Shipping entered and cleared, 1909-10, 2,018,192 tons.

The length of the Mombasa-Victoria (Uganda) Railway (state) is 584 miles; construction cost, to March 31, 1910, £5,637,333. Revenue (1910-11), £809,586; expenditure, £882,041.

The governor (1911, Sir Percy Girouard) is also commander-in-chief of the military forces.

Since the passage (1907) of the ordinance abolishing slavery in the protectorate to the close of the fiscal year 1910, claims have been paid for compensation to slave-owners and for maintenance of decrepit slaves, amounting to over £20,000. The Magadi Soda Company (Ltd.) was formed in 1911 with a capital of approximately £1,300,000, to develop the important deposits of natural soda covering an area of some thirty square miles, known as Lake Magadi, in the protectorate; to connect the same with the Uganda Railway by the construction of a branch line, about 100 miles long; and to build a pier and approaches thereto, at or near Kilindini. Preliminary work on the new railway was begun in 1911. The junction is to be at a point between Ulu Station and Kapiti Plains.

BRITISH GUIANA. A British colony, on the northeastern coast of South America. Area (estimated), 90,277 square miles. Population (negroes, East Indians, Europeans, Chinese, aborigines, and mixed races) in 1891, 278,328; estimate in 1910, 310,000. Births and deaths in 1909, 8947 and 9367 respectively. Of the total population in 1891 105,444 were agricultural laborers (90,492 on sugar estates). East Indian immigrants (1909-10), 2508; returning emigrants, 793. Capital, Georgetown (53,176 inhabitants). Schools receiving government aid (1908-9), 223, with 33,888 pupils; grant, £25,274.

Gold output in 1908-9, 73,655 ounces (value, £268,532); in 1909-10, 64,830 (£236,359). Diamond export (1909-10), 7095 carats (value, £9386). Imports (1909-10), £1,774,457 (textiles, £223,449; flour, £195,052; manures, £132,830; meats, £66,199; fish, £64,357). Exports, £1,985,337 (sugar, £1,205,215; raw gold, £229,516; rum, £128,598; balata, £95,507; rice, £64,616; timber, etc., £22,070). Tonnage entered and cleared (1909-10), 897,864. Railway lines (1909), 95 miles; telegraph and cable lines, 559; post offices, 74. Revenue (1909-10), £540,269; expenditure, £546,711. Public debt (March 31, 1910), £888,115. Savings banks depositors (December 31, 1909), 29,398, with £298,893 deposits.

Governor (1911), Sir Frederic Mitchell Hodgson.

BRITISH HONDURAS. A British crown colony in Central America. Area, 7562 square miles; population (1901), 37,479; 1911, 40,458. Birth-rate (1909), 37.005, death-rate, 21.832 per thousand (illegitimate births, 41.62 per cent. of total births). Capital, Belize (10,478 inhabitants in 1911. Primary schools (1909), 41; pupils, 4447; grant-in-aid, £3714 (in addition 5 receiving no grant). Secondary schools, 5, with 291 pupils. Mahogany and logwood are the important products; bananas, coffee, plantains, etc., are grown. Imports (1909-10), £556,430, subject to duty; duty free, £219,833. Exports, £454,532. Export of mahogany, 10,673,881 superficial feet; logwood, 6134 tons; cedar, 936,708 feet; bananas, 390,350 bunches; cocoanuts, 5,554,679; chicle, 2,213,450 pounds. Owing to low water in the streams, much of the felled mahogany remained on the banks, tying up large amounts of American capital. Tonnage entered and cleared (1909), 697,324 (397,318 tons British). Telegraph and telephone lines connect Belize with Corosal, Punta Gorda, and other stations. Revenue and expenditure (1909-10), £80,891 and £75,819 respectively. Public debt (1909), £34,736. Governor (1911), Colonel E. J. E. Swayne.

BRITISH INDIA. See INDIA, BRITISH.

BRITISH-JAPANESE AGREEMENT. See JAPAN, and UNITED STATES, *Treaties*.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British protectorate, occupying the northern part of the island of Borneo. Area, about 31,100 square miles; estimated population (Mohammedans, aborigines, and Chinese), 160,000. Sandakan (6000 inhabitants) is the chief town on the east coast, Jesselton on the west. Tobacco, tapioca, sago, rubber, cocoanuts, sweet potatoes, and coffee are grown; the forests yield timber, gums, camphor, rattans, and fruits. Birds' nests, seed pearls, and beche-de-mer are exported. Imports (1909), 2,918,307 dollars Mexican; exports, 4,575,412 (leaf tobacco, 2,521,901). Shipping entered (1909), 169,712 tons; cleared, 168,599. There are 120 miles of railway, internal telegraph and exterior cable connection, and several branch banks. Revenue (1910), 4,609,021 dollars Mexican; expenditure, 3,801,306. The territory is administered under the control of the British North Borneo Company by a governor (1911, F. R. Ellis).

BRUNEI, on the northwest coast of Borneo, was placed under British protection in 1888. Area, 3000 square miles; population (1911), 30,000. Chief town, Brunei (10,000 inhabitants). Ruling sultan, Mohammed Jemal-ul-alam. British resident, Harvey Chevallier (acting).

BRITISH SOLOMON ISLANDS. A British protectorate in the western Pacific, including Guadalcanar, Malaita, San Cristobal, New Georgia, Yela, Tulagi, Santa Cruz, Vanicoro, Choiseul, Ysabel, Kausagi, Lord Howe's group, islands in the Bougainville Straits, and other isles and islets. Area, 8357 square miles; population (1908), 251 whites, 150,000 natives. Imports (1908-9), £57,337; exports, £50,147 (copra, £39,144; ivory nuts, £2795; timber logs, £1456; gold coin, £2500—largely brought back by natives deported from Queensland). Vessels entered and cleared (1908-9), 117, of 75,156 tons. Revenue (1909-10), £11,356; expenditure,

£8500. Resident commissioner (1911), Charles M. Woodford, with headquarters at Tulagi.

BRITISH SOMALILAND. A British protectorate on the Gulf of Aden. Estimated area, 68,000 square miles; population (largely Mohammedan nomads), about 300,000. Berbera, the chief town, has, in the trading season, 30,000 inhabitants. Zeila has 15,000; Bülahar, 12,000. Imports (1910-11), £245,795 (rice, piece-goods, shirtings, dates, etc.); exports, £231,100 (skins and hides, ostrich plumes, gum, cattle, and sheep). Transport is by camels; miles of telegraph, 200. Tonnage entered and cleared (1909-10), 174,527. Revenue and expenditure (1909-10), £31,384 and £192,838. The protectorate is administered under the Colonial Office by a commissioner, who is also commander-in-chief of the military forces (1911, H. A. Byatt, acting).

BRITISH WEST AFRICA. See **NORTHERN NIGERIA**; **SOUTHERN NIGERIA**; **GOLD COAST**; **SIERRA LEONE**; and **GAMBIA**.

BROADHURST, HENRY. An English labor leader and member of Parliament, died October 11, 1911. He was born in the parish of Littlemore, near Oxford, in 1840. He attended the village school of that place until he was 12 years of age. He left this and began soon afterwards regular employment in a blacksmith shop. He worked afterwards as a stonemason. In 1865 settling in London, where he worked on the Houses of Parliament, Westminster Abbey and other well-known buildings. A lockout in the building trade in the spring of 1872 brought him to the front as a leader and he succeeded in settling the strike. In 1880 he was elected to Parliament from Stoke-upon-Trent. He continued to be a member of Parliament, except for an interval of a year and a half, until 1906. In 1884 he was appointed a member of the Royal Commission on the Housing of the Poor. Mr. Gladstone, in February, 1896, offered him the position of Under Secretary of the Home Office. He accepted this post and held it until the defeat of the government on the second reading of the Home Rule bill in the following July. He was obliged to retire from active work in 1888 on account of illness, but in 1891 was enabled to resume his political work to some extent. In the following year he ceased for a time to be a member of Parliament. He was appointed in 1892 on the Royal Commission to inquire into the condition of the aged poor. He was again elected to Parliament in 1894 and continued until 1906, when ill health obliged him to resign. He was one of the best known and most influential labor leaders in the United Kingdom. He wrote *Handy Book on Leasehold Emfranchisement* in 1885 and an autobiography.

BROWN, ELMER ELLSWORTH. An American educator, inaugurated November 9, 1911, as Chancellor of New York University to succeed Henry McCracken, who resigned in 1910. He was born in Chautauqua county, N. Y., in 1861, and graduated from the State Normal University of Illinois in 1881, and from the University of Michigan in 1889. He studied abroad for several years following his graduation from the University of Michigan. Previous to this time he had been principal of public schools in Illinois, and in 1890-91 was principal of the high school in Jackson, Mich. In 1891-2 he was appointed acting assistant professor of science and art of teaching in the University of Michigan and in the year following became assistant professor. He was appointed full professor of this

chair in 1893, holding this office until 1906. In that year he was appointed United States Commissioner of Education, at the same time holding the appointment of honorary professor of the science and art of teaching at the University of California. From 1905 to 1907 he was president of the National Council of Education. He was the author of *The Making of Our Middle Schools* (1903); *Origin of American State Universities* (1905); *Government by Influence, and Other Addresses* (1909). He also wrote many articles for educational periodicals and delivered many addresses before educational and other bodies.

BROWN-TAIL MOTH. See **ENTOMOLOGY**.

BROWN UNIVERSITY. An institution of higher learning at Providence, R. I., founded in 1764. The number of students enrolled in the various departments of the university in 1910-11 was 930. The faculty numbered eighty. The university lost several members of its faculty in the year 1910-11. Professor Willard H. Munro resigned the professorship of European history and was made professor emeritus. His work was taken by Theodore F. Collier, Ph. D., formerly of Williams College. William Kirk, associate professor of political and social science, resigned to accept the leadership of an important civic movement in the city of Rochester, N. Y. In his place John Corliss Dunning, Ph. D., was appointed instructor in social and political science. Among other resignations were those of Arthur H. Blanchard, associate professor of civil engineering, James Frankling Collins, assistant professor of botany, and Henry W. Drowne, instructor in civil engineering. During the year \$400,000 was secured toward the endowment fund of \$1,000,000, which is being raised for the work of the university. A gift of \$85,000 was received from Dr. O. H. Arnold. This sum is to be used chiefly for biological work, including the erection of a biological laboratory. The total funds of the university amount to \$3,758,926. The income in 1910-11 was \$225,673. The library contains about 175,000 volumes. The president is W. H. P. Faunce, D. D.

BRUFF, LAWRENCE LAURENSEN. An American soldier and educator. Died August 6, 1911. He was born in Maryland in 1851 and graduated from the United States Military Academy in 1875. He was promoted through various grades until he became lieutenant-colonel, in 1906. From 1891 to 1900 he was instructor in ordnance and gunnery at the United States Naval Academy. In the latter year he was appointed assistant at the Watervliet Arsenal, N. Y., in which position he remained until the time of his death. He was the author of *Exterior Ballistics, Niven's Method* (1885); *Notes on Machine and Rapid Fire Guns, Small Arms and Ballistic Machines* (1892); *Gunpowder and Interior Ballistics* (1892); *Exterior Ballistics, Gun Construction, United States Sea Coast Guns* (1892), and *Ordnance and Gunnery* (1906).

BRUNEL. See **BRITISH NORTH BORNEO**.

BRUNSWICK. See **GERMANY**.

BRYAN, NATHAN PHILEMON. United States Senator (Democrat) from Florida. He was born in Orange (now Lake) county, Florida, in 1872 and was educated at Emory College, graduating in 1893. After studying law at Washington and Lee University he was admitted to the bar and from that time until his election

to the Senate practiced law at Jacksonville. From 1905 to 1909 he was chairman of the Board of Control of the Florida State Institutions of Higher Education. He received the nomination for the Senate at the Democratic primary election of January 31, 1911. He was thereupon elected by the legislature. (See FLORIDA.) His term of service will expire in 1917.

BRYAN, WILLIAM J. See NEBRASKA.

BRYN MAWR COLLEGE. An institution for the higher education of women at Bryn Mawr, Pa., founded in 1885. The number of students in 1910-11 was 439, of which 70 were graduate students and 369 non-graduate. The faculty and staff of the college numbered 62. Among the benefactions received during the year was \$150,000 for the establishment of a school of education with a practice school in which graduate students will be instructed in the best methods of teaching high school grades. A legacy of \$750,000 was received from the late Emma Carola Woerishoffer of New York City, a graduate of the class of 1907. The same will probably be devoted to the general endowment of the college. The library contains about 60,000 volumes. President, Miss M. Carey Thomas.

BUCK'S STOVE AND RANGE COMPANY. See LABOR, AMERICAN FEDERATION OF.

BUCKWHEAT. Data on the world's production of buckwheat are not available. In the United States the crop of 1911 produced on 833,000 acres amounted to 17,549,000 bushels, as compared with an acreage of 860,000 and a production of 17,598,000 bushels in 1910. The crop ranks relatively high, being over 7 per cent. above the five-year average and being exceeded by only two crops since 1868. The total value of the crop based on a farm value of 72.6 cents per bushel on December 1, 1911, amounts to \$12,735,000, which is above the five-year averages by 13 per cent., and which has not been exceeded since the sixties. Only once, in 1908, has the price per bushel been higher than this year since 1883. The leading buckwheat-producing States in 1911, as for a number of years past, were Pennsylvania, New York, and Michigan. Pennsylvania produced 6,373,000 bushels on 291,000 acres, New York 5,964,000 bushels on 280,000 acres, and Michigan 1,206,000 bushels on 67,000 acres. West Virginia and Maine, which ranked next, produced 864,000 and 450,000 bushels respectively. The highest average yield per acre was secured in the three northern New England States and West Virginia, Maine standing first, with thirty bushels, and West Virginia last, with twenty-four bushels per acre. The higher value of cereal straws has given rise to a more extended use of buckwheat straw for stable bedding and for mulching strawberries and other horticultural purposes, where a coarse, non-matting material is required.

BUFFALO. See BUILDING, and MUNICIPAL GOVERNMENT.

BUFFALO ART EXHIBITION. See PAINTING.

BUILDING. An interesting summary of reports from twenty cities in the United States, published by Bradstreet shows that the projected building in 1911 aggregated a total of \$824,088,000, against \$846,712,000 in 1910, and \$899,723,000 in 1909. To these amounts New York contributed in 1911 22 per cent., or \$188,-

933,000, as compared with 24 per cent. in 1910, and 30 per cent. in 1909. This was not uniformly the case in all the boroughs, as Manhattan and Queens showed a gain over 1910, but in the other boroughs in the greater city less than in the record year of 1909. In Chicago the aggregate for 1911 was \$105,269,000, or a gain of 8 per cent. over 1910, and of 15 per cent. over 1909, so that in the former year the Chicago proportion of the country's building was 12 per cent., as against 11 per cent. in the earlier years. Philadelphia ranks after Chicago, with a total expenditure of \$39,970,000, a slight increase over 1910, but a slight loss from 1909. Los Angeles, Cal., comes fourth, with an expenditure of \$22,947,000, which is a gain of 6 per cent. over 1910, but of 70 per cent. over 1909. San Francisco, with an aggregate expenditure of \$20,915,000, gained 6 per cent. over 1910, but lost 26 per cent. from 1909. The cities with expenditures in excess of \$15,000,000 in 1911 were Boston, Portland, Ore., Detroit, St. Louis, and Washington, in the order named. Minneapolis, Kansas City, Milwaukee, Pittsburgh, Cincinnati, Newark, N. J., and Buffalo, showed expenditures during 1911 in excess of \$10,000,000 each. See ARCHITECTURE.

BUILDING OPERATIONS IN 1911. See FINANCIAL REVIEW.

BULGARIA. A constitutional monarchy of the Balkan Peninsula. Capital, Sofia.

AREA AND POPULATION. Estimated area (including Eastern Rumelia, 12,585), 37,199 square miles. Population (1905), 4,035,623 (of whom Eastern Rumelia, 1,174,535); census of December 31, 1910, 4,329,108. Population of Sofia (1910), 102,769; Philippopolis (capital of Eastern Rumelia), 47,929; Varna, 41,317; Ruschuk, 35,823; Slivno, 25,141; Shumla, 22,275; Plevna, 21,145. Marriages (1908), 37,049; births, 169,338; deaths, 101,803; still-births, 937.

EDUCATION. Primary education is free, nominally compulsory, and state-aided; the rich are required to pay fees in the higher schools. Elementary schools (1906-7), 4581, with 8960 teachers and 415,685 pupils; secondary, 390 (1900 and 44,190). There are special, technical, and foreign schools, and a university at Sofia. The Orthodox Greek is the state church, though cut off from the patriarch of Constantinople.

INDUSTRIES. Of the total population, about five-sevenths are dependent upon agriculture. Area under cultivation, 3,585,544 hectares (2,158,338 under cereals, 89,818 under vines, 3000 under tobacco); under woods and forests, 3,041,324. The wheat export (the most important cereal) was 160,916 tons in 1909. Sericulture and the manufacture of attar of roses are carried on. Livestock (1905): 2,167,275 cattle; 8,081,716 sheep, 536,616 horses, 124,216 asses, 11,828 mules, 1,370,201 goats, and 461,241 swine. The mines are state-owned and yield coal, iron, gold, silver, lead, manganese, and copper.

COMMERCE AND COMMUNICATIONS. The trade for four years is given in thousands of leva as follows:

	1907	1908	1909	1910
Imports	124,661	130,150	160,430	177,357
Exports	125,595	112,357	111,434	129,052

The principal articles of the 1910 trade are given as follows:

Imports 1000 leva	Exports 1000 leva
Textiles, etc.....49,383	Cereals80,811
Metals, etc.....23,299	Animal prods.....13,002
Machinery, etc....19,777	Textiles, etc.....10,037
Colonial prods....10,348	Animals 7,224
Skins, etc..... 9,188	Perfumes 5,555
Timber, etc..... 6,993	Skins 4,038
Chemical prods.... 5,538	Colonial prods.... 2,056
Resins and oils.. 5,109	Metals, etc..... 1,127
Paper, etc..... 3,772	Wooden wares ... 656

The principal countries of origin and destination in 1910 were Austria-Hungary (imports 47,572,000 leva, exports 7,828,000), Germany (34,120,000 and 14,218,000), Great Britain (22,628,000 and 15,315,000), Turkey (21,024,000 and 44,283,000), France (15,348,000 and 9,039,000), Belgium (8,507,000 and 20,944,000), Italy (6,843,000 and 1,818,000). Vessels entered (1910), 16,931, of 3,895,899 tons; cleared, 16,898, of 3,891,868 tons. Railway mileage, 1082 in operation; 187 under construction. State telegraph lines, 3687 miles; wires, 7500; offices, 295. Telephone lines, 1157 miles. Post offices, 2070.

FINANCE. The monetary unit is the lev, worth 19.3 cents. Revenue and expenditure are given below for three years in leva (1911 estimate):

	1907	1910	1911
Revenue	149,515,231	173,389,493	178,445,500
Expenditure	115,658,812	163,451,041	178,395,443

The details of the 1911 budget are expressed below in thousands of leva:

Revenue 1000 leva	Expenditure 1000 leva
Customs 63,230	Public debt 40,440
Direct taxes 39,949	War 39,642
Transport 30,420	Public Works 30,382
Domains, etc.... 12,680	Instruction 23,598
Imports 10,716	Interior 10,460
Licenses 9,450	Com. and Agriculture ... 10,083
Fines 1,031	Finance 8,443
Other 10,969	Foreign Affairs... 6,452
	Justice 5,836
	Other 3,048
Total178,445	Total178,395

The public debt stood January 1, 1911, at 555,590,213 leva.

NAVY. Six torpedo boats, of 100 tons each, and two, of twenty; one transport, two yachts, and one cruiser of 735 tons make up the navy. Personnel, about 1000 officers and men.

ARMY. This effective army is well trained and armed with the most modern weapons. It consisted in 1911 of a total establishment of 56,593 men, of whom 892 were in the naval service. This gave a strength of 35,505 for the infantry, 5560 for the cavalry, 7937 for the artillery, and 3412 for the engineers. In February, 1911, the annual contingent amounting to about 24,000 men was embodied in the army, of which 18,000 were for two years' service in the infantry, and 2300 were for the cavalry and artillery, respectively, both classes for three years' service. At the same time a second contingent of 10,000 men for six months' service was incorporated in the infantry. As about 80,000 young men are available each year, and some 24,000 are embodied, it is possible easily to maintain the army at a peace strength of about 2500 officers and 53,000 men, while in addition those who have served their time with the standing army

pass into the reserve for 18 years, with the result that a war strength of about 380,000 officers and men, with about 425 guns, affording a well-trained army, is available on mobilization. The organization includes nine divisions, with headquarters at Sofia, Philippopolis, Slivno, Shumla, Ruschuk, Vratza, Dubnitsa, Eski-Zagra, and Plevna. Each division is made up of two brigades of four regiments, and generally of nine batteries, while six divisions include in addition cavalry regiments. During the year the cavalry strength was being raised to ten regiments, and each infantry regiment was given a machine gun section.

The Sofia military school turns out annually well-trained officers, and the staff organization is complete and efficient. The artillery is armored with Schneider-Canet quick-firing guns, and with Krupp mountain guns, and is among the best trained in European armies.

By a law of May 17, 1911, the constitution and function of the Superior Military Council of the kingdom of Bulgaria was determined. It was composed of the minister of war as president, the chief of staff of the army, the three generals commanding the various divisions, inspector-generals of the various organizations, artillery, cavalry, engineers, and infantry, and the aide-de-camp to the king. To this body may be added other high military officials. The council is assembled at the order of the minister, particularly once a year at the end of the summer manoeuvres, and at other times as needed to discuss military problems.

GOVERNMENT. Reigning sovereign (1911), Ferdinand, born February 26, 1861; elected July 7, 1887; married (1), 1893, Princess Marie Louise of Parma; (2), 1908, Princess Eleonore of Reuss-Köstritz; proclaimed king of the Bulgarians October 5, 1908. Heir-apparent, Prince Boris, born January 30, 1894. The ministry, as constituted March 29, 1911, was composed as follows: President of the Council and Minister of Foreign Affairs, Iv. Ev. Guechov; Interior, Al. Ludskanov; Finance, T. Theodorov; Instruction, S. S. Bobtchev; Justice, P. Abrachev; War, Gen. N. Nikyphorov; Commerce and Agriculture, D. Christov; Public Works, etc., K. Apostolov.

HISTORY. On October 5, 1908, Prince Ferdinand had proclaimed the independence of Bulgaria. This was followed by his assumption of the title of king, which was later recognized by foreign powers. After the proclamation of independence there followed negotiations with Turkey concerning an indemnity, and these finally resulted on April 19, 1909, in an agreement whereby all differences were settled and Turkey acknowledged Bulgarian independence. During 1910 there were reports of serious friction between Turkey and Bulgaria, owing to outrages in Macedonia and trouble on the frontier. On January 27, 1911, negotiations with Turkey concerning a commercial treaty were broken off and the Bulgarian tariff was applied in its full force to Turkish products. As in the preceding year there were reports of friction with Turkey, but no serious trouble occurred. As to the relations with Austria-Hungary, concerning which rumors implying an estrangement between the two countries had been frequent since the events of October, 1908, they were placed definitely upon a friendly basis by the visit of King Ferdinand to Vienna in March. Early in February the government proposed the calling of a

National Assembly to change certain points in the constitution, and on February 18 this proposal was adopted by the Sobranje. Toward the end of that month the Sobranje, after the discussion of the impeachment of the Stamboulovist ministry, voted by a two-thirds majority that five of the ex-ministers should be tried by a special State Court of Justice on the charge of systematically violating the laws to their personal advantage and the injury of the public treasury. On March 26, the premier, M. Malinov, whose demands for radical electoral reform were offensive to the king, offered his resignation. He was succeeded by Mr. Ivan Guechov, former foreign minister, who formed a new cabinet consisting of a coalition of Nationalists and Progressives. The new prime minister had been prominent for many years, having held the highest official positions. The leading feature of the government programme was a promise to promote cordial relations with Turkey, and all Bulgaria's neighbors, and to secure the sympathies of the great powers. On June 30, the Sobranje adopted by a large majority the measure modifying the constitution. In the following month it passed Article 24 of the Consolidation bill, which regulated the succession of King Ferdinand's first male descendant. This decision had been preceded by violent debates, in the course of which charges were made against the king in connection with the state municipal loan of 1901. Toward the close of the year there were reports of friction with Turkey. After the failure of the commercial negotiations, and the adoption of the Bulgarian tariff schedules to Turkish products, there had been virtually a tariff war between the two countries. Turkey retaliated against the Bulgarian tariff imposition by an especially prepared tariff applying to Bulgarian imports. In October the Bulgarian government expressed alarm at the mobilization of Turkish troops, and drew the attention of the powers to Turkey's military preparations, which it declared were unjustifiable. Representatives of the powers, however, assured the Bulgarian government that no aggressive action on the part of Turkey against Bulgaria would be permitted.

BULL, CHARLES STEDMAN. An American physician, died April 17, 1911. He was born in New York City and graduated from Columbia University in 1864, and from the College of Physicians and Surgeons in 1868. Following his graduation he was house surgeon in Bellevue. He then spent ten years in the universities of Vienna, Heidelberg, and Paris, and in London. He was surgeon of the New York Eye and Ear Infirmary, visiting surgeon at the Charity Hospital, professor of ophthalmology at the Cornell Medical College, and consulting ophthalmic surgeon in St. Luke's and other hospitals in New York City. From 1903 to 1907 he was president of the American Ophthalmological Society. He was a member of several learned societies.

BULLIS, JOHN LAPHAM. An American soldier, died May 28, 1911. He was born in New York in 1841 and was educated in the schools of that State. He enlisted in 1862 in the 126th New York Volunteer Infantry and after serving for two years was commissioned captain of the 118th United States Colored Volunteer Infantry. He served with this regiment until mustered out of service in 1866. In the following year he was appointed lieu-

tenant in the regular army. He was attached to the 41st infantry. He became captain in 1866 and in 1897 he was transferred to the paymaster's department with the rank of major, having received the brevet rank of major in 1890 for gallant services in action in Indian fights near Saragossa, Mexico, in 1876. He was also mentioned in despatches for gallantry in action against the Indians in the Burro Mountains, Mexico, in 1881. He was made brigadier-general in 1906, at the time of his retirement, which was granted at his own request after a service of over forty years.

BUNTING, Sir PERCY WILLIAM. An English editor, died July 22, 1911. He was born in 1836 and was educated at Owens College, Manchester, and Pembroke College, Cambridge. He became a barrister in 1862. In 1882 he became editor of the *Contemporary Review* and held that position until the time of his death. Before assuming the editorship of this magazine he had been a contributor to it for several years. Under his conduct the *Contemporary Review* contained many of the most notable articles found in any modern periodical. He actively participated in modern social reform movements and exerted a wide influence in their behalf. He was a keen politician and was active in the National Liberal Federation and for his services was rewarded with knighthood in 1908. He was a prominent member of the Methodist church of Great Britain and from 1902 to the time of his death was editor of the *Methodist Times*. He stood for Parliament in 1892, but was defeated.

BURNETT, FRANCES HODGSON. See LITERATURE, ENGLISH AND AMERICAN, *Fiction*.

BUSINESS CONDITIONS IN 1911. See FINANCIAL REVIEW.

BUSONI, FERRUCCIO B. See MUSIC.

BUTLER, GEORGE PRENTISS. An American banker and philanthropist, died April 8, 1911. He was born in 1862, a son of William Allen Butler, the writer and poet. He graduated from Princeton in 1884 and was for several years thereafter one of the masters of the Lawrenceville School. In 1893 he came to New York and was associated with his brother, William Allen Butler, Jr., in several railroad reorganization committees; in 1898 he established the firm of George Butler & Brother. He was chosen president of the Albany and Susquehanna Railroad Company, and was well known for his activities in connection with reorganization committees on some of the Gould railway lines. He took great interest in civic and philanthropic work.

BUTTER. See DAIRYING.

BY-PRODUCTS OF COKE. See COKE.

CABELL, WILLIAM LEWIS. An American lawyer and soldier, died February 22, 1911. He was born in Danville, Va., and graduated from the United States Military Academy in 1850. He served against the Indians in the West until 1861, when he resigned his commission to accept a commission in the Confederate army. He rose to the rank of brigadier-general. He was captured on a raid into Kansas and was held as a prisoner of war until April 28, 1865. After the war he practiced law at Ft. Smith, Ark., and afterwards at Dallas, Tex., of which city he was four times mayor. From 1885 to 1889 he was United States marshal of the northern district of Texas.

CÁCERES, RAMÓN. President of the Republic of Santo Domingo, assassinated November 19, 1911. He had for some years been a political power in the Dominican Republic. He shot and killed President Ulises Hereaux after the latter had brought about the death of Cáceres' father. Under the rule of Luperon the latter had been cabinet minister and Hereaux, who was rising in power, disliked him and procured his death. He had no special desire to be president of the republic, but placed his cousin Vásquez in the presidential chair and he himself took a cabinet place after Hereaux's followers had been turned out of the capital. He afterward made Morales president, and he returned to his estates as a private citizen. He soon learned that Morales was organizing a party of his own in coalition with Hereaux's friends and he thereupon forced Morales to flee and he himself took the presidential chair in 1906. His rule brought prosperity to the country, but he had many enemies, among them Morales and Jiménez, former vice-president. In April, 1911, Cáceres received definite information that his assassination had been planned and that his government was to be overthrown by Morales and Jiménez. They were arrested, tried, and released. Cáceres was shot by two political malcontents, Luis Tejera and Jaime Mote, Jr., who fired at the president as he was leaving the house of a relative. He was removed to the American legation, where he died. The assassins fled to San Cristóbal.

CALAFATITA. See **CHEMISTRY, INDUSTRIAL.**

CALENDAR. See **ASTRONOMY.**

CALIFORNIA. POPULATION. The population of the State, according to the Thirteenth Census, of April, 1910, was 2,377,549, compared with 1,485,053 in 1900. The percentage of increase in the decade was 60.1. The principal cities and their population in 1910 and 1900 are as follows (the figures in parentheses are for 1900): San Francisco, 416,812 (342,782); Los Angeles, 319,198 (102,479); Oakland, 150,174 (66,960); Sacramento, 44,696 (29,282); Berkeley, 40,484 (13,214); San José, 28,946 (24,600); Stockton, 23,250 (17,506); Fresno, 24,892 (12,470); Alameda, 23,383 (10,464).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. In that year the number of farms was 88,197, compared with 72,542 in 1900. The land in farms was 27,931,444 acres, compared with 28,828,951 acres in 1900. The improved land in farms was 11,380,894 acres, compared with 11,958,837 acres in 1900, a decrease of 508,943 acres in the decade. The average acreage per farm in 1910 was 316.7, compared with 397.4. The value of the farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$1,614,694,584 in 1910, as compared with \$796,527,955 in 1900. Farms operated by owners and managers numbered 70,049, those operated by tenants 18,148. Of farms owned free from mortgage numbered 39,368, and those mortgaged 26,749. The native white farmers numbered 58,926; foreign-born white, 26,193; negro and other non-white, 3078. Of the non-whites, 1816 were Japanese, 591 Indians, 512 Chinese, and 159 negroes. The value of the cattle, domestic animals, poultry, and bees in 1910 was \$127,599,938, compared with \$67,303,325 in 1900. The cattle numbered 2,077,

025, valued at \$52,785,068; horses and colts, 408,886, valued at \$47,099,196; mules, 69,761, valued at \$9,016,444; swine, 766,551, valued at \$5,106,883; sheep, 2,417,477, valued at \$3,348,997. Poultry of all kinds in 1910 numbered 6,087,267, valued at \$3,844,526. The acreage, production, and value of the leading crops in 1910 and 1911 were as follows:

		Acreage	Prod., bu.	Value
Corn1911	51,000	1,836,000	\$1,652,000
1910	50,000	1,875,000	1,500,000
Wheat1911	480,000	8,640,000	7,603,000
1910	550,000	9,900,000	9,306,000
Oats1911	210,000	7,140,000	4,213,000
1910	200,000	7,400,000	3,700,000
Rye1911	8,000	136,000	116,000
1910	7,000	119,000	102,000
Rice1911	150	6,000	4,000
1910	100	3,000	2,000
Potatoes1911	72,000	9,720,000	3,748,000
1910	70,000	9,100,000	7,735,000
Hay1911	700,000	1,225,000	13,352,000
1910	700,000	1,281,000	12,298,000

a Tons.

MINERAL PRODUCTION. The total value of the mineral products in the State in 1910 was \$86,688,347, compared with \$80,098,581 in 1909.

In the production of oil California stands first among the States. In 1910 the output was 73,010,560 barrels, as compared with 55,471,601 barrels in 1909. The production of 1910 does not include 4,156,450 barrels held in storage by the producers. About half this was produced in 1909 and half in 1910. The production in 1911 showed a continued increase. The preliminary estimates of the United States Geological Survey indicated an output of about 83,000,000 barrels in 1911. While consumption increased, production continued to exceed the demand and stocks increased to about \$40,000,000. Prices thereupon receded to about thirty cents a barrel. The increased production in 1911 was chiefly from the Sunset and McKittrick region, from the pools already developed in 1910. Three significant discoveries were made during the year: First, evidences of a large field in La Habra Valley; second, the discovery of a deep oil sand in the Midway field containing a heavier oil than in the higher zones; and third, the discovery at the end of the year in the Coalinga field of a zone of light oil 1500 feet below the main producing beds, in a lower geologic formation. Interesting developments were also made in the Cat Canyon field.

California in 1910 ranked second among the States in the production of gold. There were mined in that year 988,853 fine ounces, valued at \$20,441,400. This record is surpassed only by Colorado. This output was a decrease of 25,272 fine ounces from that of 1909. The output of placer gold decreased while the gold production in hydraulic and dredge placer mining increased, although it fell off heavily in drift mining and over fifty per cent. in surface sluicing. The production in 1911, according to the estimates of the Director of the Mint was 982,544 fine ounces, valued at \$20,310,987. This gave California first place in the production of gold in 1911. The production of silver in the State in 1910 was 1,840,085 fine ounces, valued at \$993,646, a decrease of 258,168 fine ounces from the production of 1909. The silver produced in 1911, according to the figures of the Director of the Mint was 2,727,336 fine ounces, valued at \$1,500,035. The de-

crease in the production in 1911 was due to the litigation concerning smelter fumes in the copper-mining industry which caused some of the larger copper properties to be closed altogether and others to be worked on part time only. A large portion of the silver mined in the State is produced from the copper mines.

The State produces a large amount of copper. The output in 1910 was 47,760,200 pounds of blister copper, as compared with 53,568,708 pounds in 1909. The reduction was due to the necessity of eliminating from the smelter smoke ingredients injurious to vegetation. This resulted in a decreased output by all the smelters of the Shasta county district and the closing down of one. The same cause would decrease the output for 1911. The State ranks sixth among the producers of copper.

The output of coal in California is small and the production in 1910 was only 11,164 short tons, valued at \$18,336. While the State in 1909 showed the largest percentage of increase among the coal-producing States, in 1910 its percentage of decrease was the smallest. Both changes were due to fluctuations in operations of a single company, the Stone Canyon Consolidated Company in Monterey county. This company has been engaged for several years in developing the property and building a railroad, but on account of unforeseen difficulties, its resources were exhausted and work was suspended in October, 1909. All the coal produced in 1910 came from Amador and River-side counties.

The State is the chief producer of quicksilver. The output in 1911 was 19,131 flasks, valued at \$880,217, a gain of 1920 flasks, and \$79,733 over 1910.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions included two State prisons, five hospitals for the insane, an institution for the feeble-minded, industrial home for the adult blind, and an institution for the education of the deaf and blind. The administration of these institutions is in the hands of the State Board of Charities, consisting of six members. At the legislative session of 1911 many important measures relating to charities and corrections were passed. Among these were a new juvenile court law and a law creating a State reformatory and making an appropriation to purchase the site and prepare plans.

POLITICS AND GOVERNMENT

The State legislature met in January, 1911, and passed an unusual number of important laws. These will be found summarized in the paragraph *Legislation* below: In addition to the work of the legislature, the political history of the State during the year was of unusual interest and importance. On January 10, John D. Works (q. v.) was elected United States senator to succeed Senator Flint. Senator Works was a candidate of the insurgent wing of the Republican party in the elections of 1910 and received a plurality of the votes cast, although the other Republican candidate, A. G. Spalding, carried a larger number of the districts of the State. The legislature by a vote of ninety-two to twenty-one decided that Mr. Works was the successful candidate for the office. The legislature approved an amendment which submitted to the popular vote the question of woman suffrage,

and this, from point of interest outside the State, was the most important question at issue in the election held on October 10. In addition to the woman suffrage amendment, however, twenty-one other amendments were submitted to the voters at this election. These included the initiative and referendum, and the provision for the recall of all officials, including judges. While the total votes for and against these measures were much smaller than the vote on suffrage, the majorities for the initiative and referendum and for the recall were much larger than the majority for the suffrage amendment. The recall received a majority of approximately 100,000, while the provisions for the initiative and referendum were carried by over 60,000. The vote on the woman suffrage amendment was so close that the first reports indicated its defeat. It was, however, carried by a majority of about 3500. In addition to those mentioned above, the amendments carried provided for employers' liability, empowered the Railway Commission to fix rates, prevent discrimination, and regulate public service corporations, extended the powers of the municipalities and made their officers more fully responsible to the popular will, prohibited the setting aside of verdicts on criminal cases on purely technical grounds, and provided that after the introduction of bills in the legislature there should be a recess of thirty days for their consideration, after which no bills may be introduced except by a three-fourths vote. There were two other elections in the State during the year which were of unusual importance. The first of these was the city election in San Francisco, which was held on November 8. The rival candidates for mayor were James Rolph, Jr., a prominent merchant, and Mayor McCarthy, who was a candidate for reelection. The contest was between the Labor party, to which the city officers belonged, and the so-called Citizens' ticket, which nominated Mr. Rolph. Mr. Rolph defeated Mayor McCarthy by a large majority. The former's vote was the largest ever cast in the city. Only three representatives of union labor won places on the Board of Supervisors, while thirteen were elected by the Citizens' ticket.

The municipal election held in Los Angeles on December 5 was the first held after the passage of the woman suffrage amendment. It marked, in addition, a contest between the Socialist party and the so-called Good Government ticket, which had as its candidate Mayor Alexander, for reelection. The Socialists had nominated as their candidate Job Harriman, who was one of the counsel for the McNamara brothers (see below). The confession of the McNamaras, which came several days before the election, without doubt had some influence on the vote cast for Mr. Harriman, although his motives in the affair were not discredited. The election board had the largest registration in the history of the city. Strong effort was made to have women register and this was eminently successful. Over 75,000 women registered for voting before the day of election. The total registration was over 160,000. At the election on December 5 the Good Government candidate was elected by a large majority. The total vote was Alexander 83,978, Harriman 52,293. The women voted in large numbers, and it is generally conceded that their votes carried the election decisively for

Mr. Alexander. This is the first election in a large city in which women have voted for municipal officers.

DYNAMITING CASES. The arrest, trial, and confession of J. B. and J. J. McNamara, charged with the destruction of the building of the Los Angeles *Times* in October, 1910, overshadowed in general interest all other events of the year in California. As a result of this outrage, twenty-one lives were lost and the building owned by Harrison Gray Otis, the editor of the paper, was wrecked. Mr. Otis had for years carried on a war with the labor unions and he had been the object of bitter attack on the part of organized labor. After vain attempts to detect the perpetrators of the crime, the city authorities of Los Angeles called in William J. Burns and as the result of his investigations John J. McNamara, secretary of the International Association of Bridge and Structural Iron Workers, James B. McNamara, his brother, and Ortie McManigal were arrested on the charge of having been involved in the destruction of the building. These arrests were brought about chiefly as the result of certain pieces of evidence found at the scene of the explosion, especially the remains of a battery which included an ingenious arrangement by which an alarm clock was used to set off a quantity of nitroglycerine. Similar articles had been found in various parts of the country where like explosions had occurred and by a careful following of these clues Mr. Burns became convinced of the guilt of the McNamaras and McManigal. The latter made a confession which involved the others arrested and two men, M. A. Schmidt and David Kaplan. He confessed that the dynamite used in these explosions and others had been stored in Tiffin, O., and Indianapolis, where it could be found as occasions arose. McManigal confessed altogether to complicity in fifteen dynamitings. The McNamara brothers asserted their innocence and ascribed their arrest to a capitalist plot and manufactured evidence. Indictments were found against J. J. McNamara in Indianapolis. These charged him with conspiracy to destroy a railroad bridge at Peoria, Ill., and with storing explosives in Indianapolis. After considerable legal friction, which included the arrest of Mr. Burns for kidnapping McNamara, the prisoners were finally taken to Los Angeles on requisitions from the government of California. On July 12, the McNamara brothers pleaded not guilty to nineteen charges of murder made against them. Much sympathy was shown them by labor organizations throughout the country apparently convinced of their innocence, and a large fund was raised for their defense. Clarence Darrow was engaged to defend them, and associated with him was Job Harriman of Los Angeles, who later became candidate for mayor of the city (see above). During the period between the lodgment of the prisoners in Los Angeles jail and the trial, which began on October 12, much additional evidence was gathered by the attorneys for the government. The trial was long delayed on account of the difficulty of selecting a jury, and after this was secured, various attempts to bribe jurors were discovered, although the attorneys for the defense were acquitted of complicity in these attempts. The trial had proceeded for some weeks when it came to a dramatic end on December 1 by the confession of both the Mc-

Namaras that they were guilty of the crimes charged. J. B. McNamara was accused in the indictment of having actually set off the explosion which destroyed the *Times* building, while his brother was charged with complicity and with having formulated the plans. This confession produced a great sensation throughout the country. It came with especial force to the officials of the labor unions, who, resting on the statements of the two brothers of their innocence, had gathered large sums of money for their defense. Charges were made by Mr. Burns that Samuel Gompers, president of the American Federation of Labor, had known for many months of the guilt of the prisoners. This Mr. Gompers vehemently denied. As far as was apparent, no evidence was adduced at the end of the year to connect Mr. Gompers and other high labor officials with the dynamiting outrages or with knowledge of the guilt of the McNamaras. The two prisoners received sentence several days after their confession. J. B. McNamara was sentenced to prison for life and J. J. for twenty-one years. Sentence was suspended in the case of McManigal, pending further investigations in which he was to be employed as a witness. Following the disclosures made in the trial and confessions, investigation was at once begun by a federal grand jury, although the United States government has no power to indict men for crimes committed under State jurisdiction. It has the power, however, to bring indictments for illegal transportation of explosives by interstate commerce. On December 30, indictments were found in Los Angeles against nine men, four of whom were prominent in the circles of organized labor in San Francisco and Salt Lake City. The men indicted were Olaf A. Tveitmo, secretary and treasurer of the State Building Trades Council; Anton Johannaen, general organizer of the council; E. A. Clancy, former vice-president of the Bridge and Structural Iron Workers' International Union and a member of the executive board of the State Building Trades Council; J. E. Munsey, business agent of the Structural Iron Workers, Ortie McManigal, J. B. McNamara and J. J. McNamara, M. A. Schmidt, and David Kaplan. The two latter have been fugitives from justice since the dynamiting of the *Times* building. In these indictments the prisoners were charged with being parties to and engaging in a conspiracy to commit an offense against the laws of the United States in carrying explosives from one State to another. There were four counts in each indictment and the maximum penalty in each is a fine of \$10,000 or two years' imprisonment or both. Government investigations were being continued at the end of the year.

OTHER EVENTS. On February 28, the Supreme Court of the United States handed down a decision setting aside an order made by it previously, granting a rehearing in the case of Abraham Ruef who was convicted in December, 1910, and was sentenced to fourteen years in prison for bribery. As a result of this decision, Ruef, who had been at liberty under \$350,000 bail, was finally, on March 7, taken to San Quentin prison to serve his term.

LEGISLATION. The legislature of 1911 enacted many important laws. Among these was a measure providing for the submission of an amendment to the constitution, placing the con-

trol of all public utilities of the State in the hands of an administrative body. This amendment permits municipalities to retain or after yielding it to regain the regulation of public utilities within their own borders. With this exception it gives the State complete control over its utilities: the Railway Commission was given authority to regulate railway rates, including the power to prescribe an absolute rate. Several measures were passed relating to political reforms. Constitutional amendments were instituted providing for the initiative, referendum, and recall. The direct primary law of the State was simplified and the Oregon plan for the direct election of United States senators was adopted and the party column was eliminated from the ballot. A measure providing for submission to the people of an amendment which would leave no State officer elective except the governor, lieutenant-governor, and State comptroller was defeated by a small number of votes necessary for the two-thirds majority. Several State officers were, however, omitted from the list of elective officials. The legislature adopted a workmen's compensation act and limited the hours of labor for women to eight hours for any one day or forty-eight in any one week. The criminal procedure of the State was reformed and measures were passed relating to the conservation of natural resources. Local option was adopted throughout the State and counties were given a large measure of home rule. The question of woman suffrage was submitted to the people. The legislature refused to take action on the bills relating to the admission of Oriental immigration. A measure was passed providing for a commission form of government in municipalities of the fifth and sixth classes. A tenement-house law was enacted which provides and establishes a uniform system for the plan of tenement houses throughout the State. A unique constitutional amendment submitted to the people provided for a divided session of the legislature, under which it shall meet for thirty days for the introduction of bills. It is then to adjourn for thirty days and then reconvene and pass such bills as may meet its approval. No bills are to be passed at the first session except emergency measures, and no bills shall be introduced at the second sessions except by a three-fourths vote. Another constitutional amendment for submission forbids the issuing of railroad passes to public officials, and another forbids a combination between shippers and the railroads. For child labor laws see CHILD LABOR.

STATE OFFICERS. Governor, H. W. Johnson; Lieutenant-Governor, A. J. Wallace; Secretary of State, F. C. Jordan; Treasurer, E. D. Roberts; Comptroller, A. B. Nye; Adjutant-General, Edwin A. Forbes; Attorney-General, U. S. Webb; Superintendent of Education, Edward Hyatt; Commissioner of Insurance, E. C. Cooper; Commissioner of Agriculture, R. L. Telfer—all Republicans.

JUDICIARY. Supreme Court: Chief Justice, W. H. Beatty; Associate Justices, H. A. Melvin, Lucien Shaw, F. M. Angellotti, M. C. Sloss, F. W. Henshaw, W. G. Lorigan; Clerk, B. G. Taylor—all Republicans.

STATE LEGISLATURE 1911. Republicans, Senate, thirty-one; House, sixty-eight; joint ballot, ninety-nine. Democrats, Senate nine; House, twelve; joint ballot, twenty-one. Republican

majority, Senate, twenty-two; House, fifty-six; joint ballot, seventy-eight.

The representatives in Congress will be found in the article UNITED STATES, section Congress.

CALIFORNIA, UNIVERSITY OF. An institution of higher learning at Berkeley, Cal., founded in 1868. The total number of students enrolled in all departments of the university in 1911-12 was 5724. This includes the summer sessions, in which there were enrolled 1964. Including students in departments of the university other than those included in the degree-giving system, the total enrollment was 6447. The faculty numbered 400, not including readers and laboratory assistants. F. G. Cottrell, assistant professor of physical chemistry, resigned during the year to accept a position with the United State Bureau of Mines. H. A. Overstreet, associate professor of philosophy, resigned to accept a position as head of the department of philosophy in the College of the City of New York. Dr. Herbert E. Bolton was appointed professor of American history. F. J. Teggart became associate professor of Pacific Coast history. Dr. Frederick P. Gay was called to the professorship of pathology. Dr. David P. Barrows, formerly director of education for the Philippine Islands, was appointed professor of political science and dean of the Graduate School. Among the noteworthy benefactions received during the year was one from Mrs. Phæbe A. Hearst of \$10,452 for scholarships and other items; from Miss Annie M. Alexander, \$11,743 for the support of the Museum of Vertebrate Zoology. Mrs. Jane K. Sather gave for building a campanile \$200,000, together with \$23,000 for chimes. Endowments of \$100,000 each were received for chairs of history and classics and \$25,000 for a law library. Two new buildings were occupied during the year—the University Library, erected through the bequest of Charles Franklin Doe, and Boalt Hall of Law, erected at a cost of \$150,000, of which \$100,000 was given by Mrs. Elizabeth H. Boalt, and \$50,000 by the bench and bar of California. On January 1, 1912, the Academy of Pacific Coast History became an integral part of the university directly administered by the regents. This department has under its administration the famous Bancroft Library. The library contains about 250,000 volumes. The president is Benjamin Ide Wheeler.

CAMBODIA. A French protectorate in French Indo-China (q. v.). Estimated area, 45,000 square miles. Population (1906), 1,193,534. Capital, Pnom-Penh (50,000 inhabitants). Chief products: Rice, betel, tobacco, indigo, pepper, corn, cinnamon, coffee, and cotton. Salt is mined. A cotton-seed shelling factory operates at Khsach-Kandal. The local budget for 1911 balanced at 3,242,100 piasters. Present king, Sisowath; French resident-superior, M. Outrey.

CAMEROON. See KAMERUN.

CAMIDGE, CHARLES EDWARD. A bishop of the Anglican church, died in May, 1911. He was born at Poppleton, York, England, in 1837 and was educated at Wadham College, Oxford. He served as rector of several churches in England and in 1882 was appointed canon of York. In the following year he was made rural dean. He was consecrated second bishop of Bathurst, New South Wales, Australia, in 1887. He was

the author of several volumes of sermons, controversial pamphlets, etc.

CAMPAIGN EXPENSES. See **ELECTORAL REFORM.**

CAMPAIGN OF 1912. See **UNITED STATES.**

CANADA, DOMINION OF. A British possession in North America. Capital, Ottawa.

AREA AND POPULATION. The following table shows: (1) Area in square miles, inclusive of 125,756 square miles of water area, but exclusive of the territorial seas, the Gulf of St. Lawrence, and the Canadian portion of the Great Lakes; (2) population according to the census of 1901; (3) population according to the final returns of the census of April 2, 1911:

Provinces	Area	Pop., 1901	Pop., 1911
Pr. Edward Island	2,184	103,259	93,728
Nova Scotia	21,428	459,574	492,338
New Brunswick	27,985	331,120	351,889
Quebec	351,873	1,648,898	2,002,712
Ontario	260,862	2,182,947	2,523,208
Manitoba	73,732	255,211	455,614
British Columbia	312,630	178,657	392,480
Alberta	253,540	72,841	374,668
Saskatchewan	250,650	91,460	492,432
Yukon	196,976	27,219	8,612
North-West Territories:			
Keewatin	516,571	9,800	16,951
Mackenzie	562,182	5,216	
Ungava	854,961	5,113	
Franklin	500,000	
Total	3,745,574	5,371,315	7,204,527

The official report of the 1911 census includes the results of planimetric calculations of provincial areas. The figures for these areas are the same as those given in the foregoing table for the first six provinces named, and are as follows for the others: British Columbia, 355,855 sq. miles; Alberta, 255,285; Saskatchewan, 251,700; Yukon, 207,076; North-West Territories, 1,921,685; total Canada, 3,729,655. The returns of the census were disappointing, falling considerably short of expected results; the official estimate of March 31, 1910, was 7,489,781, or some 285,000 more than the census showed a year later. The rural population in 1911 was 3,924,083 and the urban 3,280,444, against 3,369,018 and 2,002,297 respectively in 1901. The increase of the rural population in the decade was therefore 16.48 per cent. and of the urban 63.83 per cent. The increase per cent., of total population, by provinces was: Nova Scotia, 7.13; New Brunswick, 6.27; Quebec, 21.46; Ontario, 15.58; Manitoba, 78.52; British Columbia, 119.68; Alberta, 413.08; Saskatchewan, 439.48; total Canada, 34.13. The following showed a decrease: Prince Edward Island, 9.23 per cent.; Yukon, 68.73; North-West Territories, 15.79. Preliminary 1911 returns for the larger cities: Montreal, 466,197; Toronto, 376,240; Winnipeg, 135,430; Vancouver, 100,333; Ottawa, 86,340; Hamilton, 81,879; Quebec, 78,067; London, 46,177; Halifax, 46,081; Calgary, 42,763; St. John, 42,363; Victoria, 31,620; Regina, 30,210.

Arrivals at ocean and inland ports in years ending March 31: 1908, 262,469 (of whom 120,182 from United Kingdom and 58,445 from United States); 1909, 146,908 (52,901 and 59,933); 1910, 208,794 (59,790 and 103,984).

EDUCATION. Public instruction is controlled by the separate provincial governments. Primary education is free and, except in Quebec and Manitoba, compulsory. Educational statistics by provinces follow:

Alberta. In 1908 there were 851 schools (including nine separate schools for Roman Cath-

olics), with 1192 teachers and 39,653 pupils. Expenditure, \$2,636,835.

British Columbia. For year ending June 30, 1910: Enrollment in public schools, 39,822 (boys 20,449, girls 19,373); average daily attendance, 28,094 (70.54 per cent.); teachers, 1037; expenditure, \$1,917,236 (including \$612,053 for education proper by the province and \$1,098,660 by municipalities, etc.).

Manitoba. For year ending December 31, 1910: Enrollment, 76,247; average attendance, 43,885 (57.55 per cent.); teachers, 2774; expenditure, \$4,000,671 (including \$1,327,010 for teachers' salaries). School departments in operation, 2227 (against 1943 in 1907); collegiate institutes, 8; high schools, 15; intermediate schools, 48; pupils above eighth grade, 5653.

New Brunswick. During the year ending June 30, 1910, there were enrolled in the public schools 68,154 pupils, against 67,785 in 1909. For the term ending June 30, 1910: Enrollment, 62,994; average attendance, 42,418 (67.33 per cent.); teachers, 1974; schools, 1860 (1902 in preceding term); provincial grants, \$873,696 (including \$580,069 voted at school meetings, etc.).

Nova Scotia. For the term ending July 31, 1910: Public schools (common and high), 2579, with 2723 teachers, 102,035 pupils enrolled, and 65,629 in average attendance (about 70 per cent.). Pupils enrolled in common schools, 93,378; high schools, 8657; technical schools, 2183; government night schools, 123; grand total, 104,341 (103,970 in 1909). Expend. for the year, \$1,265,233 (of which \$357,282 provincial grants).

Ontario. Statistics for 1909: 1. *Elementary schools:* (a) Public schools, 5913; enrollment, 401,268; average attendance, 240,008 (59.81 per cent.); teachers, 9185; expenditure, \$7,321,239 (\$4,600,652 for teachers' salaries). (b) Roman Catholic separate schools, 467; enrollment, 55,034; attendance, 34,553 (62.78 per cent.); teachers, 1089; expenditure, \$820,184 (\$407,890 salaries). (c) Protestant separate schools (included with (a) above), 6; enrollment, 402; attendance, 250 (62.11 per cent.). (d) Kindergartens, 165; enrollment, 17,816; attendance, 6523; teachers, 312. (e) Night schools (1909-10), 15; enrollment, 889; attendance, 449; teachers, 31. 2. *Secondary schools:* (a) High schools (including 43 collegiate institutes), 145; enrollment, 33,101; attendance, 20,791; teachers (January, 1910), 820; expenditure, \$1,621,637 (\$941,657 salaries). (b) Continuation schools (included in public and separate schools above) doing high-school work, 128; attendance, 5866. 3. *General.* Total enrollment in elementary and secondary schools, 508,563; attendance, 302,324; grand total in elementary, secondary, normal, and model schools, 510,701, against 504,573 in 1908; grand total of schools in operation, 6489; grand total paid for educational purposes, \$9,763,060 (\$4,643,571 salaries of public and separate teachers, who numbered 10,391, of whom 1860 male).

Prince Edward Island. For year ending September 30, 1910: Schools, 478; departments, 591; teachers, 591; enrollment, 17,932; attendance, 11,632 (64.86 per cent.); expenditure, \$181,572 (of which government \$127,547).

Quebec. Statistics for the year 1909-10: *Elementary schools:* 5720; teachers, 6901; enrollment, 218,914; attendance, 162,928 (74.42 per cent.). *Model schools:* 661; teachers, 2988; enrollment, 100,492; attendance, 82,514 (82.11 per cent.). *Academies:* 236; teachers, 2491;

enrollment, 55,141; attendance, 47,593 (86.31 per cent.). *Normal schools*: 11; teachers, 128; enrollment, 787; attendance, 780. *Schools annexed to normal schools*: 11; teachers, 45; enrollment, 1246; attendance, 954. *Roman Catholic classical colleges*: 19; teachers, 642 (men); enrollment, 6599 (boys); attendance, 6053. *Universities*: 4; teachers, 476 (men); enrollment, 2963 (of whom 135 girls); attendance, 2960. *Schools for deaf, dumb, and blind*: 4; teachers, 76; enrollment, 537. *Schools of art and design*: 13; teachers, 56 (men); enrollment, 2632 (boys); attendance, 1399. *Night schools*: 81; teachers, 180; enrollment, 5634; attendance, 3266. *Total schools*: 6760; teachers, 14,000 (men, 3128, women, 10,872); lay 8195, religious 5805; enrollment, 394,945 (boys 200,126, girls 194,819), against 387,393 in 1908-9; attendance, 308,982 (78.23 per cent.). Aggregate contributions for education in 1908-9, \$5,517,866; in 1909-10, \$6,210,530.

Saskatchewan. For year ending December 31, 1909: Public elementary schools, 1692; departments, 1937; enrollment, 53,969; attendance, 28,202 (52.25 per cent.); 13 high schools and a normal school. Expenditure, \$3,032,999 (of which \$1,044,011 teachers' salaries).

AGRICULTURE. The year 1910 showed a decline in the value of agricultural products as compared with 1909, the record year in the history of the country. Exclusive of British Columbia, which is not included in Canadian agricultural statistics, the area in field crops in 1908 was 27,505,603 acres and the value of the products, computed at local market prices, \$432,534,000; in 1909, 30,065,556 acres and \$532,092,100; in 1910, 32,711,062 and \$507,185,500. Values by provinces in 1909 and 1910 respectively: Ontario, \$200,398,000 and \$204,002,000; Quebec, \$90,071,000 and \$97,107,000; Saskatchewan, \$97,677,500 and \$84,138,400; Manitoba, \$74,420,500 and \$55,206,000; Nova Scotia, \$22,319,300 and \$21,203,000; New Brunswick, \$18,150,900 and \$18,959,000; Alberta, \$20,741,000 and \$16,582,000; Prince Edward Island, \$9,213,900 and \$9,998,100.

Final estimates of the acreage in field crops and value of yield in 1910, 1909, and 1908:

Livestock estimates, June, 1909, and June, 1910, respectively, with values on latter date: Horses on farms, 2,132,489 and 2,213,190 (\$293,398,000); milch cows, 2,849,306 and 2,853,951 (\$121,613,000); other horned cattle, 4,383,779 and 4,260,963 (\$131,781,000); sheep, 2,705,390 and 2,598,470 (\$15,819,000); swine, 2,912,509 and 2,753,064 (\$31,157,000); total value, \$593,768,000, against \$558,819,000 in 1909.

HOMESTEADS. Ordinary homestead entries and preëmptions in 1909 and 1910:

	Homesteads	Preëmptions
	1909	1910
Manitoba	2,526	3,132
Saskatchewan	19,354	26,878
Alberta	14,907	18,013
British Columbia	274	234
Total	37,061	48,257

Purchased homesteads in 1909 numbered 997 and in 1910, 1863; entries for South African volunteer homesteads, 2624 and 2186. (See AGRICULTURE.)

MINING. The following table shows the official valuation of the principal mineral products and of the total product in 1900, 1905, 1909, and 1910 in thousands of dollars:

	1900	1905	1909	1910
Silver	2,740	3,615	14,179	17,580
Nickel	3,328	7,551	9,462	11,181
Gold	27,908	14,169	9,382	10,206
Copper	3,066	7,498	6,815	7,094
Pig iron*	583	1,032	2,222	1,651
Lead	2,761	2,677	1,692	1,216
Coal	13,742	17,520	24,781	30,910
Cement	663	1,924	5,346	6,412
Bricks	2,275	3,934	4,911	5,992
B'd'g stone	1,520	1,830	3,127	3,650
Asbestos	748	1,503	2,285	2,556

* From Canadian ore.

	1900	1905	1909	1910
Gypsum	259	586	810	934
Petroleum	1,151	856	560	389
Total metals	40,522	36,946	44,157	49,439
" non-metals	23,899	32,133	47,675	57,385
" minerals	64,421	69,079	91,831	106,824

The total mineral production was valued at \$106,823,023 in 1910, against \$91,831,441 in 1909, \$64,420,983 in 1900, and \$16,763,353 in 1890. About half of the coal is now produced in Nova Scotia, two-fifths of the gold in Yukon, over a third of the nickel in Ontario, and almost all of the silver in Ontario (at the Cobalt mines), and of the asbestos in Quebec. Mineral output by provinces in 1909 (final figures) and 1910 (preliminary): Ontario, \$37,374,577 and \$43,017,026; British Columbia, \$22,479,006 and \$24,547,817; Nova Scotia, \$12,504,810 and \$14,054,534; Quebec, \$7,086,265 and \$8,103,275; Alberta, \$6,047,447 and \$7,876,458; Yukon, \$4,032,078 and \$4,737,375; Manitoba, \$1,193,377 and \$1,470,776; New Brunswick, \$657,035 and \$585,891; Saskatchewan, \$456,246 and \$557,806. The Ontario Bureau of Mines values the 1910 output at \$39,313,895, against \$32,981,375 for 1909 and \$17,854,296 for 1905. Discrepancies between the bureau figures and those of the Dominion Department of mines are due to differences in method of computation.

FISHERIES. The annual catch has been valued as follows: 1904, \$23,516,439; 1905, \$29,479,562; 1906, \$26,279,485; 1907, \$25,490,349; 1908, \$25,451,094; 1909, \$29,629,170. In the latter two years the values by provinces were: British Columbia, \$6,465,038 and \$10,314,755 respectively; Manitoba, Alberta, Saskatchewan, and Yukon, \$861,392 and \$1,373,181; New Brunswick, \$4,754,298 and \$4,676,314; Nova Scotia, \$8,009,838 and \$8,081,111; Ontario, \$2,100,078 and \$2,177,813; Prince Edward Island, \$1,378,624 and \$1,197,556; Quebec, \$1,881,817 and \$1,808,436. The most valuable fish taken in 1908 and 1909: Salmon, \$4,814,250 and \$8,204,524; cod, \$3,361,409 and \$3,812,807; lobsters, \$4,200,279 and \$3,657,147; herring, \$2,471,063 and \$2,754,751; halibut, \$1,405,316 and \$1,240,486; whitefish, \$819,626 and \$1,000,127; mackerel, \$1,336,810 and \$948,071; smelts, \$470,253 and \$868,843; haddock, \$716,820 and \$829,554; trout, \$666,322 and \$621,124; pickerel, \$502,076 and \$685,494; sardines, \$684,808 and \$551,294; fish for bait, \$496,022 and \$574,762. Persons employed in the fishing industry in 1909, 90,357; capital invested, \$17,357,932.

MANUFACTURES. The industrial census taken in 1906 for the calendar year 1905 showed 15,796 establishments, with a capital of \$846,585,023; wage earners, 356,034; wages for labor, \$134,375,925; and value of products, \$718,352,603 (Ont., \$367,850,002; Que., \$219,861,048).

COMMERCE. The following table shows imports of merchandise for home consumption, of total merchandise, of coin and bullion (in thousands of dollars), and total imports during the last three years, ending March 31:

Years	Mdse. Home Consup.	Total Mdse.	Coin and B.	Total Imports
1909	288,217,515	299,768,166	9,988	309,756,608
1910	369,815,427	385,835,103	6,018	391,852,692
1911	451,745,108	462,041,330	10,206	472,247,540

For the same years, exports of domestic merchandise, of total merchandise, of coin and bul-

lion (in thousands of dollars), and total exports were as follows:

Years	Domest. Mdse.	Total Mdse.	Coin and B.	Total Exports
1909	242,603,584	259,922,366	1,590	261,512,159
1910	279,247,551	298,763,993	2,695	301,358,629
1911	274,316,553	290,000,216	7,196	297,196,365

In the fiscal year 1910, dutiable imports of merchandise for consumption amounted to \$227,264,346; free, \$142,551,081; import duties, \$61,024,239; in 1911, \$282,723,812, \$169,021,296, and \$73,312,368, respectively.

Principal classifications of imports for consumption for the year ended March 31, 1910, and 1911, respectively: Metals, minerals, and their manufactures, \$78,385,037 and \$105,726,942 (including iron and steel, \$59,462,946 and \$81,771,478); coal, coke, etc., \$20,245,038 and \$32,264,134; cotton and its manufactures, \$28,080,654 and \$32,876,059; wool and its manufactures, \$24,625,396 and \$26,382,711; sugar, molasses, etc., \$14,946,412 and \$17,480,856; settlers' effects, \$10,273,428 and \$14,072,611; wood and manufactures, \$11,462,522 and \$17,237,372; drugs, dyes, chemicals, etc., \$10,095,075 and \$12,178,260; fruits, \$9,431,209 and \$11,955,008; hides and skins other than furs, \$8,237,014 and \$8,105,330; leather and manufactures, \$4,202,934 and \$5,331,710; furs and manufactures, \$5,768,075 and \$5,001,070; silk and manufactures, \$5,983,340 and \$6,930,448; rubber, gutta percha, and manufactures, \$5,954,903 and \$6,950,583; oils, \$5,543,462 and \$7,869,288; tea, \$5,347,854 and \$5,654,833; paper and manufactures, \$4,646,014 and \$5,537,411; electrical apparatus, \$3,688,538 and \$5,129,677; tobacco, \$4,030,670 and \$4,816,292; vehicles, \$3,636,273 and \$7,257,859; books, etc., \$4,054,601 and \$4,588,945.

The following table shows by great classes the values of Canadian produce exported and of total exports (that is Canadian and foreign produced combined) in the years ending March 31, 1910 and 1911 (a, signifies produce of mine; b, produce of fisheries; c, produce of forest; d, animals and their produce; e, agricultural produce; f, manufactures; g, miscellaneous articles; h, total; i, coin and bullion; j, grand total):

	1910		1911	
	Can. prod.	Total	Can. prod.	Total
a	\$40,087,017	\$40,530,843	\$42,787,561	\$43,078,440
b	15,668,162	15,760,391	15,675,544	15,789,859
c	47,617,033	47,688,256	45,439,057	45,597,599
d	52,926,515	54,696,630	52,244,174	53,053,837
e	90,433,747	102,347,694	82,601,284	90,059,113

g	125,161	1,786,818	285,815	1,988,836
h	279,247,551	298,763,993	274,316,553	290,000,216
i	2,594,536	7,196,155
j	279,247,551	301,358,529	274,316,553	297,196,365

Grain is the leading export, details of which in thousands of bushels (b) and thousands of dollars (d) are shown below for fiscal years; also, wheat flour, in thousands of barrels (b) and thousands of dollars (d), figures representing domestic exports (that is, the products of Canada).

Years	Wheat	Oats	Barley	All grain	Wh. fl.
1900—b	16,845	6,929	2,156	30,065	768
d	11,995	2,143	1,010	18,067	2,793

Cont.	Wheat	Oats	Barley	All grain	Wh. fl.
1906—b	..14,700	2,367	1,041	19,748	1,321
d	..12,387	862	515	15,125	5,878
1909—b	..49,137	5,256	2,959	59,205	1,738
d	..48,148	2,176	1,746	53,783	7,891
1910—b	..49,741	3,402	2,045	56,867	3,064
d	..52,609	1,567	1,108	56,751	14,860
1911—b	..45,802	5,432	1,545	53,841	3,049
d	..45,521	2,145	831	49,536	13,855

Other important domestic exports, in the fiscal years 1910 and 1911 were: Lumber, \$38,490,476 and \$36,135,973; cheese, \$21,607,692 and \$20,739,507; silver, \$15,009,937 and \$17,269,168; living animals, \$11,798,028 and \$9,598,885; meats, \$8,013,680 and \$9,001,559 (bacon, \$8,019,454); flaxseed, \$3,642,476 and \$0,144,622; wood manufactures, \$6,094,844 and \$6,061,306 (wood pulp, \$5,204,579 and \$5,715,532); wood for pulp, \$6,076,628 and \$6,092,715; copper, \$6,023,925 and \$5,575,033; gold, \$6,016,126 and \$5,344,465; hides and skins other than furs, \$5,430,591 and \$4,607,545; furs, \$3,716,320 and \$4,277,744; cod-fish, \$3,619,853 and \$4,389,155; salmon, \$4,887,632 and \$4,091,910; paper, \$3,156,096 and \$3,912,196; nickel, \$3,842,332 (in 1911); lobsters, \$3,218,466 and \$3,265,294.

In the years ending March 31, 1910 and 1911, merchandise imported for home consumption and domestic merchandise exported are shown below by countries, in thousands of dollars:

Countries	Imports		Exports	
	1910	1911	1910	1911
Great Britain	95,336	109,935	139,483	132,157

COMMUNICATIONS. Total single-track rail-

way mileage in operation June 30, 1906, 21,429; 1909, 24,104; 1910, 24,731. For fiscal years 1909 and 1910 respectively: Gross earnings, \$145,056,336 and \$173,956,217; working expenses, \$104,800,084 and \$120,405,440; net earnings, \$40,456,252 and \$53,550,777; capital, \$1,308,471,416 and \$1,410,297,687. Mileage in operation by provinces in 1909 and 1910 respectively: Alberta, 1322 and 1488; British Columbia, 1796 and 1832; Manitoba, 3205 and 3221; New Brunswick, 1547 and 1522; Nova Scotia, 1351 and 1351; Ontario, 8220 and 8230; Prince Edward Island, 269 and 269; Quebec, 3663 and 3795; Saskatchewan, 2631 and 2932; Yukon, 91 and 91. Electric railways, June 30, 1909, 989 miles; 1910, 1049; earnings for fiscal year 1910, \$17,076,124; working expenses, \$10,121,781; capital, \$102,044,979. Canada has an extensive system of canal, river, and lake navigation. In 1910 there were 7749 miles of government telegraph lines (including 255 miles of cables), with 479 offices, chartered companies' lines, 28,726 miles, with 145,997 miles of wire and 2954 offices. Post offices, March 31, 1908, 11,823; 1909, 12,479; 1910, 12,887, the latter number being distributed as follows: Alberta, 695; British Columbia, 570; Manitoba, 700; New Brunswick, 1410; Nova Scotia, 1953; Ontario, 3748; Prince Edward Island, 467; Quebec, 2344; Saskatchewan, 983; Yukon, 20. Post offices, March 31, 1911, 13,324. Postal revenue in fiscal year 1911, \$12,212,952; expenditure, \$11,020,223.

During the year 1911 there was marked progress in railway building. The development of Transcontinental line and other extensive work continued without abatement. The eastern half of the Transcontinental line, extending from Moncton in New Brunswick to Winnipeg, was being built by the Dominion government, while the western portion from Winnipeg to Prince Rupert of the Grand Trunk Pacific Railway was under construction by the Grand Trunk Pacific Company, by whom the entire line will be operated when completed. Progress in track laying in western Canada up to December 2 was operated as follows: On the main line rail head had reached 1075.5 miles west of Winnipeg. On the Alberta coal branch, which was being built from Bickerdike into the Brazeau coalfields, the track had reached mile 21.4 south of Bickerdike. On the Tofield-Calgary branch rails had been laid 105.3 miles south of Tofield. On the Young-Prince Alberta branch, rail head was at mile 67.3 north of Young. The entire portion of the branch between Melville and Regina had been completed, a mileage of 98.4. The fifty-two miles on the Melville-Canora branch was also completed. On the Moosejaw branch between Regina and Moosejaw, track was laid 141 miles west of Regina. On the mountain division rails had been laid to the mouth of the tunnel at mile 104 east of Prince Rupert. The government section had virtually been completed from Moncton to Quebec, and about three-quarters finished beyond.

The Canadian Northern Railway was also making substantial progress, the work on the eastern section reaching the Rocky Mountains, while on the Pacific slope an advance from Vancouver towards Yellowhead Pass had been made. The Canadian Northern was developing a number of important branch lines in the prairies, and in the east a direct line between Ottawa and Toronto. The Canadian Pacific had virtually completed a line from Vic-

toria Harbor, at the southeast point of Georgian Bay, to Bethany, near Peterborough, Ontario, with the object of connecting this new grain port with the main system. Like the other companies, The Canadian Pacific Railway has been increasing its prairie mileage during the year, and it would seem as if ample facilities for this great wheat-growing region were being developed. Minor construction was also recorded in all of the provinces of the Dominion, and the general activity in Canadian railway building recalled the progress of former years in the United States.

The Canadian Pacific Railway showed an important increase in 1911 over the previous year. There were in operation 10,481 miles of line, and 292 miles belonging to other lines, while 983 miles were in course of construction, making a total of 11,756 miles. For 1910 similar figures were 10,271 miles in working, 262 other lines operated, and 471 miles in course of construction, or a total of 11,004 miles. This was a substantial gain over 1905 when the system aggregated 9487 miles, of which 8563 were in working, 438 miles were operated for other lines, and 481 miles were in course of construction.

SHIPPING. In the fiscal year 1911, there entered 15,235 vessels of 11,919,339 tons register (15,008 of 10,950,000 tons in 1910) and cleared 14,769 vessels of 10,377,847 tons (14,776 of 9,853,713 tons in 1910). British and Canadian vessels entered 8862 of 8,832,905 tons, and cleared 8615 of 7,221,430 tons.

FINANCE. The table below shows in dollars Dominion expenditure and revenue for fiscal years ending March 31. Expenditure chargeable to Consolidated Fund is designated (a), expenditure chargeable to Capital (b), railway subsidies (c), other charges (d), total disbursements (e), Consolidated Fund receipts (f), other receipts (g), total receipts (h), difference between receipts and expenditures (i), sinking funds (j), net difference between receipts and expenditures, i. e., net excess of expenditure (k):

	1908	1909	1910	1911

k ..	14,289,000	45,969,419	12,238,267	8,773,506

Principal sources of Consolidated Fund receipts in the fiscal year 1911: Taxes, \$89,835,232 (customs \$72,965,395, excise \$16,869,837); chargeable to capital: Railways and canals, \$10,818,834; posts, 9,146,952; Dominion lands, \$3,108,736; interest on investments, \$1,868,773. Leading items of expenditure chargeable to Consolidated Fund: Collection of revenue, \$24,951,636; interest on public debt, \$12,535,851; railways and canals, \$11,123,251; subsidies to provinces, \$9,092,472; public works, \$8,621,431; posts, \$7,954,223; militia and defense, \$6,868,651; civil government, \$4,463,095. Expenditure chargeable to capital: Railways and canals, \$27,110,246; public works, \$3,742,717. Net

public debt at end of fiscal years: 1900, \$265,493,807; 1908, \$277,960,860; 1909, \$323,930,279; 1910, \$336,288,546; 1911, \$340,042,052. On the last two dates, gross public debt \$470,663,046 and \$474,941,487 respectively, and total assets \$134,394,500 and \$134,899,435 (including sinking funds \$14,782,613 and \$11,196,826).

BANKS. On November 30, 1911, the chartered banks of Canada had total assets \$1,389,053,388 and total liabilities \$1,173,438,296 (not including paid-up capital \$107,472,558 and reserve fund \$95,699,232); deposits by the public, payable in Canada, \$930,654,407; notes in circulation, \$101,943,050; balance due to provincial governments, \$25,657,904. On March 31, 1911, the 1151 post office savings banks had 147,478 open accounts with deposits and interest \$43,330,579 (average account, \$201.93); the eighteen government savings banks (of which thirteen in Nova Scotia) had deposits and interest \$14,763,752; total, \$58,094,331, against \$58,264,230 March 31, 1910.

NAVY. The Department of the Naval Service was created by a law which became effective May 4, 1910. The Dominion government bought the British first-class cruiser *Niobe*, which arrived at Halifax, October 21, 1910, and the British second-class cruiser *Rainbow*, which arrived at Esquimaux, November 7, 1910. These are for use as training ships, and the construction of other vessels is projected. Details of the *Niobe* and *Rainbow* respectively: length, 435 and 300 ft.; draught, 26 and 17.5 ft.; displacement, 11,000 and 3600 tons; horsepower, 16,500 and 9681; speed, 20.5 and 19.7 knots; complement, 705 and 273. Expenditure of the Navy Department for the fiscal year 1910-11, \$2,492,812 (naval service proper, \$1,209,983). See paragraph below under *History*.

ARMY. Canada, like other British dominions, has a military organization under the direction of a section of the Imperial General Staff, but in accordance with the provisions of the Dominion Militia acts. In 1911 the chief of the general staff and first military member of the Militia Council was Maj.-Gen. C. J. Mackenzie, C. B. Under the law of 1904 every Canadian between the ages of eighteen and sixty is liable for service, and the establishment consists of a permanent force of 235 officers and 2673 men (March 31, 1910), and an active militia. The permanent force does garrison duty and furnishes instructors for the active militia at the various schools of instruction. The active militia has an authorized establishment of 4611 officers and 51,430 men, which was considered by Sir John French, reporting on the military strength of the Dominion government, most inadequate, as a standard of 5000 officers and 100,000 men was essential, as well as many important changes in organization and administration. In 1910 3358 officers and 39,232 men were under training. It was proposed that the Kingston Military College, at which a cadet may fit himself for a commission in the imperial army, as well as in the Canadian permanent force, should be developed into a staff college, as the need of a well-trained staff was one of the great defects of the existing organization. Eight new military divisions were created in accordance with General French's recommendations, and in 1911 eight British officers were appointed to coöperate with the Canadian War Office.

A reorganization of army commands was in

progress in 1911. The four military commands in Eastern Canada were reconstituted so as to form six divisional areas providing six infantry divisions and four cavalry brigades. The headquarters of these divisions were as follows: First Division, London (Ontario); Second Division, Toronto (Ontario); Third Division, Kingston (Ontario); Fourth Division, Montreal (Quebec); Fifth Division, Quebec; Sixth Division, Halifax (Nova Scotia). To each divisional area was to be appointed an officer to command the infantry division, and in addition to command and administer such other units as might be quartered in the division area. A general staff officer (second grade) was to be appointed to the staff of each divisional area. The fortress of Halifax, within the sixth divisional area, will be commanded by a selected officer. The military districts of Western Canada, Nos. 10, 11, and 13, Winnipeg, Victoria, and Calgary, were to remain temporarily as district commands.

GOVERNMENT. The executive authority is vested in the British sovereign acting through a governor-general, who is assisted by a cabinet of sixteen members. The legislative power devolves upon a parliament of two houses, the Senate (eighty-seven members, nominated for life by the governor-general) and the House of Commons (221 members, elected by popular vote). A reapportionment of the Commons is necessitated by the 1911 census. The Right Hon. Sir Albert Henry George, Earl Grey (who was appointed September 26 and assumed office December 10, 1904), was succeeded as governor-general in 1911 by the brother of the late King Edward, His Royal Highness Prince Arthur, Duke of Connaught and Strathearn, who was appointed March 6 and assumed office October 13. The cabinet of Sir Wilfrid Laurier, who as a Liberal had been prime minister since 1896, was succeeded October 10, 1911, by a Conservative cabinet as follows: Prime Minister, Robert Laird Borden; Secretary of State, Dr. William James Roche; Postmaster-General, Louis Philippe Pelletier; Minister of Marine and Fisheries, and of the Naval Service, John D. Hazen; Trade and Commerce, George Eulas Foster; Interior, Robert Rogers; Public Works, Frederick Debartch Monk; Railways and Canals, Francis Cochrane; Finance, William Thomas White; Justice, Charles J. Doherty; Militia and Defense, Samuel Hughes; Labor, Thomas W. Crothers; Inland Revenue and Mines, Wilfrid Bruno Nantel; Customs, Dr. John D. Reid; Agriculture, Martin Burrell; without portfolio, J. A. Loughheed.

Each province has an elected legislature and an executive (lieutenant-governor) appointed by the governor-general and assisted by a responsible ministry. See articles on the several provinces.

HISTORY

THE GOVERNOR-GENERAL. At the beginning of February, 1911, the king officially announced the appointment of the Duke of Connaught as the governor-general of Canada to succeed Earl Grey. The latter left Quebec for England on October 12, his successor being at that time on his way to Ottawa to assume office. Earl Grey had wished to retire two years earlier but his resignation had been deferred for various reasons. His administration, though not con-

spicuous, had been marked by tact and by interest in Canadian advancement. To his energy was largely due the national festival on the Plains of Abraham and the dedication of the ground to public uses. Though assailed by the Nationalist group in Quebec as a propagandist of imperialism, he maintained the most cordial relations with the leaders of the main parties and won the regard of the people as a whole. He showed a marked interest in important public movements, notably the campaign against tuberculosis, national educational experiments and the conservation movement. He sought by all means to stimulate Canadian patriotism and at the same time promote the sense of British unity and loyalty to the empire. The appointment of the Duke of Connaught as his successor was received with favor.

THE RECIPROCITY AGREEMENT. The terms of the reciprocity agreement were made public in Washington in the last week of January, 1911. The chief points in it were the free exchange between the two countries of the natural products of each, especially of food, and the reduction of rates upon the manufactures of such products. The leading food products on the reciprocal lists of the proposed agreement were: Wheat and other grain, fresh fruits and vegetables, dairy products, fish, eggs, poultry, cattle, and sheep, and other live animals. Specified commodities at present free in one country were to be admitted free into the other, as for example cottonseed oil should be made free in Canada, and rough lumber should be made free in the United States. Then followed reduced identical rates in each country on secondary food products and on certain manufactured commodities, also lower Canadian duties on agricultural implements imported from the United States.

The agreement had grown out of the discussions following the passage of the Payne-Aldrich tariff law in the United States in 1909. The maximum and minimum clause of that law provided for the levying of the maximum rate of twenty-five per cent. *ad valorem* on the products of any country that granted more favorable terms to any other country than it granted to the United States. Although this clause was not aimed specifically at Canada, it was found that the latter country fell within its provision, for under the "favored nation" clause Canada granted certain privileges that it did not grant to the United States. President Taft entered soon afterwards into negotiations with the Ottawa government for mutual concessions that would remove this difficulty, offering in return for some unimportant reduction in the Canadian duties to apply the minimum tariff to Canada, and promising further to raise the question of reciprocity. The tariff was adjusted on this basis and conferences between United States and Canadian commissioners on the subject of reciprocity were held during the closing weeks of 1910. The movement was generally regarded with favor in the United States, and though it was opposed by a certain element in Congress it was passed after a short political struggle. See **UNITED STATES, History, and GREAT BRITAIN, History.**

RECIPROCITY AND PARLIAMENT. The reciprocity agreement came before the Canadian Parliament in February, 1911. The Liberal party stood strongly in favor of reciprocity and at first there was also a considerable element in

the Opposition that approved it. Soon, however, the Conservative party in the House united solidly against it and it was fought by the Conservative and Independent members with increasing vigor. Among the criticisms urged against it were the sweeping nature of its provisions, whose effect it was said could not be properly estimated; the opening up to the United States of Canada's natural resources, which ought to be kept and developed for the good of the Canadian people; the instability and insecurity of such an arrangement; and the danger of an absolute commercial union with the United States and, finally, of annexation. Speeches by many prominent men in the United States were quoted to show that the ulterior motive was the conquest of Canada by peaceful means. As time went on it was clear that both in Parliament and in the country general opinion on the subject was growing more sharply divided. A debate in the House at the end of February brought out many criticisms. It was said that the country was now prosperous and that the most conspicuous feature of its prosperity was Canada's independence of foreign countries. The reciprocity agreement would be followed by dislocation and temporary loss and the general effect on the volume of business would be unfavorable. It was said that certain industries would be seriously injured, if not destroyed, and that it was especially probable that the American beef trust would destroy all meat-packing industries. The provisions as to pulp and paper were condemned as unwise and it was said that the federal government should rather have supported the provinces in their conservation policy. The commercial grip of the United States on Canada was tightened and there was always a menace to the commercial independence of a smaller country in its relations to a larger one. On the other hand, Sir Wilfrid Laurier challenged the statement that the agreement would turn trade from Canadian into American channels or put an end to mutual preferential trade with Great Britain or destroy Canada's national resources or imperil her industries. And he declared that the Canadian people were not so lacking in self-respect as to think that reciprocity meant annexation.

THE GENERAL ELECTIONS. The date of the general elections was fixed as September 21, and the campaign began on August 15 with speeches by Sir Wilfrid Laurier, the premier, and Mr. Borden, the leader of the Opposition. The leading issue from the first was the reciprocity agreement with the United States, and it was soon evident that the campaign was to be the most serious electoral contest that Canada had seen since 1896. Each side prophesied success and pressed its position with great vigor, the Opposition contending that reciprocity was a revision of the tariff as the result of the conference of the United States behind closed doors, that it meant free trade in everything that the farmer produces, and Sir Wilfrid Laurier contending, on the other hand, that Canada would derive greater benefit from it than the United States, and that there was nothing in the compact to prevent the British people from giving Canada preference or to prevent Canada from extending preference to British manufacturers. In general, the Liberals had the best of the economic argument. It seemed obviously to the advantage of Canada

that she should have an increased market for the commodities in which she especially abounded, that is, the products of her farms, fisheries, forests, and mines. Natural products were Canada's chief exports, whereas the United States had already reached the limit of her agricultural production and must henceforth import foodstuffs in ever increasing quantities. Moreover, reduced duties on food and foodstuffs would lower cost of necessities to the consumers in cities and towns. The opening up to Canada with her seven million inhabitants of the vast market of an adjoining nation with ninety millions seemed an incontestable gain. The Conservatives did not spend much time in meeting these arguments. They found their strongest argument in an appeal to national sentiment and anti-American prejudice. They seized largely on the indiscreet words of Americans, and when they were not indiscreet they gave them a sinister interpretation. A remark of President Taft to the effect that Canada was now at the parting of the ways was quoted as implying that she ultimately would unite her fortunes with her neighbor's. They appealed to the fear of annexation, harping on it incessantly as likely to follow reciprocity. They played on the latent distrust of the United States as an unscrupulous bargainer. Many Canadians believed their country was overreached in the various boundary disputes and resented the disregard shown toward Canada by the United States in the McKinley and Dingley tariffs. The inconsiderate speeches of American politicians and the boastfulness and spread-eagleism of American tourists, combined with the memory of real or fancied national grievances and a small nation's natural jealousy of a large one, produced a state of mind among the people at large that was highly susceptible to these Conservative appeals. Moreover, the beneficiaries of protection were active in Canada as they have always been in the United States against any step in the direction of free trade. Manufacturers represented that shops would close and workmen be thrown out of employment if reciprocity were adopted. Although reciprocity did not apply to manufactures, with the exception of a few farm implements, manufacturers were generally to be found on the side of the Opposition. They feared the extension of the principle from free foods to free manufactures.

Early in the campaign the Conservatives had announced their programme, which included, aside from the rejection of reciprocity, thorough reorganization of the method of expenditures, the granting to the prairie provinces of their natural resources, the construction and operation of the Hudson Bay Railway by an independent commission, the establishment of a permanent tariff commission, the extension of civil service reform, and other features, but as the campaign went on the question of reciprocity soon dwarfed all other issues. Apart from merely local questions there was only one other issue that appeared at all conspicuously in the campaign. This was the question of naval policy, which was brought into prominence through the Nationalist party, founded and led by Mr. Henri Bourassa. This party had vigorously attacked the Laurier Navy act as a dangerous sacrifice of Canadian autonomy to imperial domination. Though the Na-

Premier and President of the Privy Council

CANADA

tionalists were at odds on this point with the Conservatives, who, while criticising the methods and spirit of the Navy act, favored the principle of local Canadian navy, they joined the Conservatives in seeking the overthrow of the present government. On the reciprocity issue Mr. Bourassa and his party seemed at first somewhat undecided, but later developed an opposition to it. In general, the Nationalists and Conservatives coöperated for the overthrow of the Liberals. The result of the election was a complete victory for the Conservatives, the membership of the Liberals in the House of Commons being reduced to 80, and that of the Conservatives increased to 126, while the Nationalists won eight seats in the province of Quebec. Thus the Conservatives and Nationalists obtained a majority of fifty-four over the Liberals. The figures showing the state of the parties before and after the general election are as follows:

Before the election:

	Liberal	Conservative	Nationalist
Ontario	35	51	..
Quebec	52	12	1
New Brunswick	11	2	..
Nova Scotia	12	6	..
Prince Edward Island	3	1	..
Manitoba	2	8	..
British Columbia	2	5	..
Saskatchewan	9	1	..
Alberta	4	3	..
Yukon	1	0	..
Total	131	89	1

After the general election:

	Liberal	Conservative	Nationalist
Ontario	13	72	..
Quebec	38	18	8
New Brunswick	7	6	..
Nova Scotia	7	10	..
Prince Edward Island	2	2	..
Manitoba	9	..
British Columbia	5	..
Saskatchewan	7	3	..
Alberta	6	1	..
Yukon
Total	80	126	8

The result was a great surprise and disappointment in the United States. It was due chiefly to the strong national suspicions aroused in regard to the tendency of the agreement to take Canada out of the path of her national destiny. The rural population remained steadfast to their self-interest and to the Liberal party; it was nevertheless largely won over by the Conservative appeals and in almost all localities where protected manufacturing industries were established the vote was Conservative.

THE BORDEN MINISTRY. Early in October the Borden cabinet was announced, and on October 9 it held an informal meeting at the premier's residence and later took the oath of office at the Government House. It was generally conceded that the cabinet was a strong one and represented adequately the views of the chief elements in the Opposition. Only one minister in it had ever held a federal office before. The Nationalists were represented in the cabinet by Mr. Monk, minister of public works, Mr. Pelletier, postmaster-general, and Mr. Nantel, minister of inland revenue, who, however, had been lifelong Conservatives and, while inclined towards Nationalism, were not hostile to the naval programme. Nevertheless the new govern-

ment's concessions to the Nationalists were severely criticised in certain quarters.

Soon after the formation of the cabinet, Mr. Bourassa, the leader of the Nationalists, announced in a public speech the policy of his party. He said they would hold themselves entirely independent and support the government only in such cases as deserved support. Their demand was that a plebiscite be held on the question of the navy. The people should be asked whether they wished to maintain their strict autonomy as loyal Canadians and whether they favored direct contributions to the imperial navy or wished to build a navy in Canada which would be Canadian in time of peace and British in time of war. Whichever decision they might adopt would be loyally accepted by the Nationalists.

The Twelfth Parliament of Canada was opened on November 16. The Duke of Connaught's speech, after referring to the negotiations for improved trade arrangements with the British West Indies, announced that the policy of the government would be to promote agriculture and that to this end a measure would be submitted to Parliament. The introduction of a bill to establish a permanent tariff commission was also promised. In November Mr. Borden announced that the government would not go on with the naval policy until the people had been consulted. The government did not approve, he said, of the late ministry's proposal for the expenditure of £2,000,000 in ten years for the construction of a fleet which would be obsolete by the time it was completed. The whole question would, therefore, be reconsidered. The new government pledged itself to a plan for naval defense which should be drawn up with the advice of the admiralty. It was understood from the past speeches of Mr. Borden and other Conservatives that they demanded a powerful and effective fleet. But the measure was to be submitted to the people before it passed into law. The submitting of the naval plan to an electorate was not the exclusive demand of the Nationalist party, but had been proposed by Mr. Borden long before, and it was favored by many Conservatives.

OTHER FEATURES OF THE YEAR. The population of Canada in 1901 was 5,371,315. In 1911, according to the preliminary returns of the decennial census, published in October, it was 7,081,860, and of this increase 1,705,375 was set down to immigration. Early in the year immigration was clearly on the increase and if that rate continued it would bring the annual total to 450,000, as compared with 320,000 in 1910. The immigration of negroes into the region north of Edmonton occasioned much discussion and it was suggested that the government should restrict this class of immigrants by refusing them homesteads or by imposing a head tax upon them as in the case of the Chinese. In January the Federal Railway Commission rendered a judgment which declared all express companies doing business in Canada to be over-capitalized and requiring them to submit new tariffs within three months. A serious strike of coal miners occurred in April in the coal regions of Alberta and eastern British Columbia for the purpose of limiting their employment to union labor. (See ARBITRATION AND CONCILIATION, INDUSTRIAL.) Riots occurred on April 7, and forty of the leaders were arrested. For an account of the Imperial Conference, see

GREAT BRITAIN, paragraphs on *History*. To a certain class of Canadian imperialists the conference was disappointing. These believed in commercial union and in a system of trade preferences as the best means of securing imperial unity. They wished a common fleet under a common command. They distrusted the aggressive assertion of Canadian autonomy and had always viewed Sir Wilfrid Laurier with suspicion. The latter's attitude toward questions raised at the conference was not satisfactory to this element, but on the whole was approved by the country. At the end of June the retirement of Lord Strathcona from the high commissionership was announced. Under the fisheries treaty of 1908 with the United States, regulations for the fisheries in international waters were drawn up by a committee and in 1910 Canada passed the necessary legislation for carrying them into effect, but the United States Senate in 1911 failed to take corresponding action, insisting on modifications that were not acceptable to Canada, who in September announced her intention of withdrawing the treaty. CANALS. Naturally the most important work of the year 1911 was the construction of the Panama Canal, which is treated elsewhere in the YEAR BOOK under its own title. Nevertheless, there were other works of considerable magnitude in progress, in both the United States and Europe, of which the New York State Barge Canal was perhaps the most important.

NEW YORK BARGE CANAL. During the year 1911, important progress was made along the entire New York barge canal system, which comprises the Erie, Oswego, Champlain, and Cayuga-Seneca canals. The length of canal under contract December 31, 1911, was 423.8 miles, and the value of the work under contract at the same time, at contract price including the lands, was \$74,950,318. The amount of work done on the various contracts at the end of the year amounted to \$41,232,007, while the construction work for the year 1911 amounted to \$15,362,284.

The barge canal system on which work was under way in 1911 included the Erie branch with a length of 323.2 miles (excluding the Hudson and Niagara River termini), on which thirty-five locks were being constructed; the Oneida Lake division of nineteen miles, on which no improvement was needed, and various spurs to the Erie branch for harbors at Syracuse and Rochester, aggregating 10.26 miles; the Champlain branch, 61.5 miles in length, including eleven locks; the Oswego branch, 22.0 miles long and requiring seven locks; the Cayuga and Seneca branch, with spurs at the head of the lakes having an approximate length of 27.3 miles are requiring four locks. The canal was being designed for boats of 3000 tons if the full widths of the locks were utilized, or where it was desired to have two boats pass in the most restricted channels and driven tandem to be lifted

at one lockage boats with a capacity of about 1600 tons could be used.

The width of channel in the barge canal varies with the conditions of construction. Where the excavation is not heavy, a minimum width of seventy-five feet at the bottom prevails, while the water surface has a width of 123 to 171 feet. In rock sections the bottom has a minimum width of ninety-four feet, while on river line the bottom generally is about 200 feet in width. The channel for both land line and minimum river line is twelve feet in depth. The locks are 328 feet in length between gates, making an available length of 310 feet. The width of the diameter in each lock is forty-five feet.

A number of portions of the new canal, in particular some new locks, were so nearly completed that the new channels could be used during the season of 1911. An interesting case of this kind was at Oswego, where the canal enters Lake Ontario. Here the first siphon lock to be built in the United States was constructed, and also the largest lock on the siphon principle ever built. This lock instead of having vertical gates to regulate the flow through culverts in the side wall by which the locks are filled, and emptied, has a curved culvert which forms a neck above the top of the wall of the lock. The flow of water in this neck is regulated by exhausting the air and admitting the water on the well-known principle of a siphon, and a tank is built in the wall and connects by pipes with the upper end and by an air pipe with the top of the siphon. This tank is filled with water, and by regulating its flow a vacuum is produced which forces the flow of the water through the culvert. The whole arrangement is simple and economical in maintenance, obviating steel work under water. Two siphon locks were being designed for the Cayuga and Seneca canal.

The siphon lock was first used in Germany in 1896, and the siphon principle has found application in several different forms of construction for regulating the flow of water in canals. Among these is the siphon spillway, several of which have been designed for the barge canal to carry off the surplus water accumulating in the canal under various conditions.

On the lower Mohawk River between Schenectady and Little Falls, movable dams of the bridge type, also the first to be built in the United States, have been constructed to regulate the flow of water. These consist of masonry piers carrying a steel bridge superstructure from which were suspended steel beams in pairs, carrying gates of heavy steel plate which could be slid on rollers upon the upright beams.

In connection with the barge canal, two large reservoirs, known respectively as the Delta and Hinckley reservoirs, were being constructed. The former was designed for impounding the waters of the upper Mohawk River about five miles north of Rome, and is formed by a dam 100 feet in height extending across a river gorge 600 feet wide at its base. The crest is 1000 feet in length at the top and forms a reservoir some four miles in length and two miles in width, with a capacity of 2,750,000,000 cubic feet. The area of flow at crest height is four and one-third square miles, while the drainage area is 137 square miles. The Hinckley reservoir was also designed to supply water for this portion of the barge canal, and has a capacity of 3,445,000,000 cubic feet with an area of flow at crest

height of 4.46 square miles. The drainage area is 372 square miles.

CAPE COD CANAL. During the year 1911, work on the Cape Cod canal, connecting Buzzard's Bay with Massachusetts Bay at Barnstable, progressed satisfactorily. The excavation for the canal was nearly half completed, and the break-water at Barnstable was substantially finished. In addition to the excavation across the mainland, considerable dredging for the approaches was being done, and for this work the contractors at the end of the year were building two new very large dredges. It was expected that the work would be completed and the canal in operation during the summer of 1913.

INTERNAL WATERWAYS IN THE UNITED STATES. Various projects for internal waterways in the United States have been under consideration during the year, and the discussion as to their economy and usefulness has been continued vigorously. A canal from Lake Erie to Pittsburgh was again brought into public notice during the year, and it was proposed to divide its estimated cost of \$50,000,000 among the States of Ohio, Pennsylvania, and West Virginia, which would be benefited by such a work. The control of the canal would be vested in a joint commission. There were also discussed various projects for waterways along the Atlantic coast, connecting the various bays, sounds, and rivers. For example, a committee appointed by the State of Massachusetts reported on the proposition to build a canal from Narragansett Bay to Massachusetts Bay, at an estimated expense of \$40,000,000, to save the trip around Cape Cod, and to reduce the distance further than by the Cape Cod canal. The report of this committee, submitted on May 1, 1911, was adverse to the proposition.

MANCHESTER SHIP CANAL. The Manchester ship canal reported that the year's business was the best ever enjoyed by the company and was carried on in 1911 with a substantial profit, so that a payment of £71,511 was made to the city of Manchester in the first half year. In this time there was an increase in daily paying of merchandise of £190,000 over the corresponding period of 1910, making the total amount passing through the canal some two and one-half million tons. At East Ham a lay-by 1450 feet long was constructed with a depth of twenty-eight feet of water alongside.

IMPROVING THE PARIS-ROUEN CANAL. The success of the Manchester Ship Canal led to the further consideration of the project for enlarging the locks and deepening the canal between Rouen and Paris, and thus making a seaport of Paris. This scheme was brought up in connection with the Paris floods, and a commission was considering the provision of works to prevent further flooding, which would also facilitate traffic. The commission expressed the opinion that by using more suitable boats the water-borne traffic could be adequately improved.

AMSTERDAM CANAL. It was recommended by a special commission that the lock at Tjuiden at the entrance to the Amsterdam canal should be increased to a length of 1180 feet and a width of 148 feet, with a depth over the sill of 46 feet. This would afford a greater length of lock than at the Kaiser Wilhelm canal or at the Panama canal. With it would probably go the deepening of the under harbor to 40 feet, and of the canal itself to 44 feet. This canal is of importance, as half of the vessels trading

with Holland pass through it, and between 1870 and 1911 the shipping returns showed an increase of 700 per cent.

LIÈGE CANAL. A scheme for the construction of a canal from Liège to Hasselt, with the object of diverting to Antwerp the water-borne traffic which was being carried to Rotterdam via Maestricht, was under consideration during the year. The new canal was proposed to start at Lixhe on the existing canal from Liège to Maestricht, and would traverse the hills separating the Meuse and Geer rivers by means of a tunnel 1300 meters long. It would then follow the Geer River as far as Hasselt, where connection would be made with the existing canals to Antwerp. The scheme involves the construction of fourteen locks and two lifts for the barges; and its distance, 44.5 kilometers, is such that the journey could be made in three days as against twelve to fifteen days by the existing canal systems. The new canal would be entirely under Belgian control, and would obviate the necessity of water-borne goods being transported to Holland at all, on their way from Liège to Antwerp.

BLACK SEA TO BALTIC CANAL. In Russia there was a movement to connect the Black Sea and the Baltic with a canal fourteen feet in depth at an estimated cost of \$150,000,000. For this purpose some 300 miles of the bed of the West Dvina, and 1000 miles of the bed of the Dnieper would be utilized.

CANAL ZONE, ISTHMIAN. See PANAMA CANAL.

CANARY ISLANDS. A group of islands belonging to Spain and lying off the northwestern coast of Africa. They constitute a Spanish province and have an area of 2808 square miles and a population (estimated, 1908) of 403,908. The seat of government is Santa Cruz (Teneriffe); leading town, Las Palmas. A new cable is open via Monrovia (Liberia) to Pernambuco (Brazil). Governor (1911), A. Eulate.

CANCER. Since the cultivation of cancer cells in artificial media has become possible, many interesting observations have been made as to the vital processes of these cells. Lambert and Hanes studied the methods by which it is thought cancer cells migrate from one part of the body to another, thus setting up metastases. They studied pieces of freshly implanted mouse sarcomata in mouse plasma and observed that individual cells separated themselves from the original mass and passed into the plasma by amoeboid movements. Pseudopods were thrown out on all sides of the cells in the characteristic fashion of the amoeba, but more slowly. When a preparation showing active amoeboid movement was taken from the warm chamber and examined microscopically at the ordinary room temperature, the majority of the cells retracted their pseudopods and became spherical. This phenomenon of amoeboid migration in cancer cells offers a reasonable explanation of the spread of malignant tumors in the body tissues, especially the invasion of the lymph spaces, lymph vessels, blood vessels, and serous cavities.

An enormous amount of laboratory work was done in 1911 in the general direction of the study of immunity and in the endeavor to develop curative and protective serums. Experimentally, it is now possible to produce a species of immunity to inoculation; that is, an animal can be so immunized that a malignant growth transplanted into its tissues will not flourish.

To some extent such a serum will inhibit the development of a cancer when it is injected soon after the beginning of the disease, but it cannot be said that any material progress has been achieved toward the cure of the human cancer by immunizing serums.

Probably the most important statistical investigation occupying a space of eight years, is that done under the Imperial Cancer Research Fund of Great Britain. The conclusions of the latest (fourth) report, as well as other investigations of a like nature, seem to establish certain fundamental truths concerning the biology of cancer and also to upset many preconceived theories; the parasitic theory, for example, has been practically abandoned. It is regarded as significant that cancers occur in all vertebrate animals and are not peculiar to the human race. Not only common domestic animals die from cancer, but even the cold-blooded animals suffer the same fate. Typical malignant growths have been described in birds, reptiles, frogs, turtles, salamanders, eels, and especially in fish. The one-time common theory that cancer occurred in carnivora, but not in herbivora—a theory which was eagerly seized upon and freely used by the vegetarians—is shown to be a fallacy. Not only is it shown that cancer is a disease of mature life and that carnivora live to a good age by killing the herbivora in their non-cancerous youth, but abundant observation has demonstrated that herbivora may also become cancerous, if they escape the carnivora until late enough in life to render them liable to malignant disease. Another popular fallacy that cancer is a disease of civilization and domestication from which wild animals did not suffer, has also been demolished, since it has been found that free wild animals are likewise subject to the development of malignant tumors. This wide zoological distribution, including all races of men and all animals, even marine fish, proves that cancer is not a recent acquirement, such as might be attributed to the influence of civilization. So perishes another cherished theory. One fact all statisticians agree upon, and that is that cancer is increasing among the children of men. It is estimated that one of every 1200 of the population of the United States dies of cancer every year and that at the present time there are 225,000 cases. Statistics from Germany, Great Britain, and France all show a material increase in those countries. See EPILEPSY.

The year 1911 was marked by no definite advance toward the solution of the cancer problem, with regard to either etiology or treatment. No demonstrable theory of the cause of cancer has been presented. In the matter of treatment much serious work has been done in the research laboratories of Europe and America, the major part of this being along the line of biochemical experimentation. Favorable results from the use of various cancer extracts and sera have been published during the year, but it is safe to say that surgery remains the only established means of dealing with malignant disease in the majority of cases. Nothing distinctively new has been brought forth in the surgical treatment of cancer, effort being largely directed toward the perfection of technic, the adaptation and amplification of methods already known. A notable example of this may be found in the work of Dr. William Seaman Bainbridge of New York on "Arterial Ligation in Irremov-

able Cancer of the Pelvic Organs" (*Woman's Medical Journal*, April, 1911).

In electrotherapy, as applied to cancer, the most notable results in operable cases have been obtained by means of "fulguration," first advocated and employed by De Keating-Hart of Paris, and now being used in a number of European hospitals, and by Bainbridge at the New York Skin and Cancer Hospital. This method calls for (1) the thorough surgical removal of all macroscopic cancer, and (2) the application to the field of operation—the soil upon which the cancer has been growing—of a long electric spark of high frequency and high tension. By the constant motion of the electrode and by means of a current of cold air passing through the electrode upon the tissue being fulgurated, the burning of the tissues is prevented. The method is not to be confounded, therefore, with the application to the tumor itself of desiccating short sparks. For inoperable cases De Keating-Hart has recently begun to employ "thermo-radio-therapy," a method of applying X-rays after heating the deeper tissues to be irradiated and cooling the external surface. Special methods are devised for accomplishing this purpose. Tissues thus heated are supposed to become more radio-sensitive. This method has not been employed over a period sufficiently long to warrant definite conclusions as to its value.

Wasserman's recent chemotherapeutic experiments upon mice have received favorable comment, but their ultimate value cannot be foretold at present. Interesting résumé will be found in "The Campaign against Cancer: Educational, Experimental, and Clinical" (illustrated), by Bainbridge, in *American Journal of Dermatology*, Vol. XV., No. 7, 1911.

CAPE TO CAIRO RAILWAY. See RAILWAYS, AFRICAN.

CAPE OF GOOD HOPE, THE. A province (since May 31, 1910) of the Union of South Africa (q. v.). Provincial capital, Cape Town.

AREA, POPULATION, ETC. Area, 276,995 sq. miles; population (1904), 2,409,804 (whites, 579,741). These figures include the colony (206,860 square miles, 1,480,091 inhabitants) and the native territories of East Griqualand (7594 and 222,685); Tembuland (4117 and 231,472). Transkei (2552 and 177,730), Walfish Bay (430 and 997), Pondoland (3918 and 202,757), and Bechuanaland (51,524 and 84,472). Population (census May 7, 1911), 2,563,024. Number of marriages in 1909, 9427; births, 56,318; deaths, 34,186. Cape Town had (1911) 67,170 inhabitants (with suburbs, 149,461); Kimberley, 29,519; Port Elizabeth, 30,676; East London, 21,277. Immigration (1909), 17,440 adult males, 8535 adult females, and 4470 children; emigration, 17,871 adult males, 7403 adult females, and 4423 children. Education is free, but compulsory only for children of European extraction. Aided schools, June 30, 1909, 3681; enrollment, 172,225. College students (1908-9), 842.

INDUSTRIES. In 1909 the net area alienated was 1,220,054 acres; total area disposed of to December 31, 1909, 136,386,332 acres, leaving unalienated 40,990,328 acres. The area under principal products and the yield in 1909 were as follows: Wheat, 335,294 acres, 2,345,223 bushels; oats, 331,766 and 2,395,401; barley 63,165 and 660,336; vines, 21,552 and 3,494,656 (gallons). Livestock (1909): 1,954,390 cattle,

419,963 horses and mules; (1909) 18,807,168 sheep, 8,275,120 goats, 500,000 ostriches. The mines produced in 1909 diamonds (Kimberley) to the value of £5,098,622; coal, £65,972 (76,846 tons); copper, £426,925; tin, £2445; gold, £556.

COMMERCE, FINANCE, ETC. The statistics given below are for the special trade for calendar years and inclusive of specie; those for finance, for fiscal years ending June 30:

	1907	1908	1909
Imports	£15,586,792	£13,739,878	£14,216,317
Exports	44,405,450	42,011,582	46,244,590
Revenue	7,701,192	6,981,873	7,312,112
Expenditure	8,349,316	7,973,727	7,681,305
Debt	51,235,343	53,145,880	48,306,491

Total imports (1909), £17,789,201; total exports, £46,577,006. Exclusive of specie, Great Britain supplied imports and received exports valued at £8,999,045 and £44,286,937 respectively; the British possessions, £4,522,757 and £115,326; other countries, £3,889,029 and £2,095,165. The principal imports were textiles and articles of apparel, £4,966,113; provisions, etc., £3,923,397. The chief exports of colonial produce were raw gold (originating almost entirely in the Transvaal and Rhodesia, but not included in the imports), £32,159,603; diamonds, £6,370,301; wool, £2,820,716; ostrich plumes, £2,191,207; hides and skins, £860,595; angora hair, £909,070; copper ore, £430,892; grain and meal, £360,727; wine, £9229. Tonnage entered (1909), 1,861,373 (1,459,166 British); cleared, 1,800,000 (1,530,909). In the coastwise trade, 4,871,932 tons entered, and 4,848,928 cleared. Registered shipping, January 1, 1910: 47 steamers, of 4423 tons; 6 sailing vessels, of 1389.

Railway mileage, December 31, 1919: 3329 state, 486 owned by private companies; besides 485 miles in the Bechuanaland Protectorate, etc., privately owned, but worked by the government. Telegraph lines (government), 8272; wires, 31,892; offices, 589. Telephone wires, 5847 miles. Post offices, 1087. In postal savings banks, £2,044,542.

The administrator (1911, N. F. de Waal), is aided by a provincial council and an executive committee.

CAPE VERDE ISLANDS. A group of fourteen islands about 350 miles west of Cape Verde, constituting a Portuguese colony. Capital, Praia. Area, 1457 sq. miles; population (1909), 147,424 (3856 whites). Coffee, medicinal plants, sugar, millet, indigo, and tobacco are raised. Imports and exports (1909), 1,909,634 milreis (1 milreis = \$1.08) and 235,894 milreis respectively. Vessels entered and cleared 1888, of 4,566,000 tons, exclusive of coasting trade. Estimated revenue and expenditure for 1910-11, 448,393 and 428,533 milreis respectively. Governor (1911), vacant.

CARNEGIE INSTITUTION OF WASHINGTON. This institution carries on its research through ten departments. These are the departments of botanical research, experi-

mental evolution, economics and sociology, historical research, the geophysical laboratory, department of marine biology, department of meridian astrometry, nutrition laboratory, solar observatory, and department of terrestrial magnetism. Investigations are also carried on by a board of research associates. The work of these departments will be described in detail below.

The most important event in the history of the institution during 1911 was the receipt of an additional gift of \$10,000,000 from Mr. Carnegie. This sum is to be added to the endowment of the institution.

DEPARTMENT OF BOTANICAL RESEARCH. This department carried on many important investigations during the year. Among these were studies of the evaporation, the increasing salinity, and the changes of vegetation following close upon the receding shores of the Salton Sea; of the influences of temperature, rainfall, sunlight, soil-moisture, etc., on plant organisms; of the effects following transplantation from low to high altitudes and from arid to humid localities; of the variations in water and acid content of plants; of the chemical effects induced in plant tissue by light and heat; and of the physiological functions of leaves in plant life. Dr. Ellsworth Huntington, research associate of the department, carried on an interesting series of investigations in the southwest desert area of the United States, devoting the chief part of his work to the secular variations of climate in recent geological times. Another noteworthy investigation was undertaken by Prof. H. M. Richards, who studied the respiration of cacti.

DEPARTMENT OF EXPERIMENTAL EVOLUTION. In this department the work of the year included investigation of heredity in plants, birds, insects, animals, and man. Dr. Woodward collaborated with Dr. David F. Weeks of the New Jersey State Village of Epileptics and secured a large amount of accurate statistical data bearing directly on this disorder. The results promise much important information relating to eugenics. Dr. Shull continued investigations begun formerly on the effects of self-fertilization of maize or Indian corn. Observational and experimental work was carried on along many other lines. The total number of zoölogical individuals under the study of the department exceeded 2000, while the range of plants observed included nearly 500 specimens and upwards of 40,000 individuals.

DEPARTMENT OF ECONOMICS AND SOCIOLOGY. The work of this department included chiefly the completion of researches already undertaken, and considerable progress was made in perfecting the results of investigations.

DEPARTMENT OF HISTORICAL RESEARCH. The members of the department were engaged during the year in searching the archives of Great Britain, France, Spain, and Mexico, as well as those of the United States for all accessible data, and these are being rapidly put into form for publication in convenient manuals. Three works were published during the year: *Guide to the Materials for American History in Roman and Other Italian Archives*; *Inventory of Unpublished Material for American Religious History in Protestant Church Archives and Other Repositories*; and *Calendar of Papers in Washington Archives Relating to the Territories of*

the United States. There were in the press at the end of the year, *Guide to the Manuscript Material Relating to American History in the German State Archives*, and *Guide to Materials for the History of the United States in the Principal Archives of Mexico*. The department has issued ten manuals, which have been greatly in demand by professors and historians both in Europe and America.

GEOPHYSICAL LABORATORY. The work of this department is toward the solution of that large and difficult group of chemical and physical problems presented by the materials of the earth's crust. Twenty-six papers were issued by members of the staff of the laboratory during 1911. Among these are contributions to general physics and a noteworthy paper on "The Constitution of Portland Cement." An interesting field of work has been preliminary studies of an active volcano carried on in the laboratory.

DEPARTMENT OF MARINE BIOLOGY. During the year the construction of a new vessel for the work of the department was begun. This boat has been named the *Anton Dohrn* in honor of the founder of the Stazione Zoologica, director for many years of the Marine Laboratory of Naples. During the year twenty-one papers were issued by members of this department. One of the most important of these relates to the rôle of certain bacteria in depriving surface sea-water of nutrition, and another records definite progress of the quantitative determinations of the growth of corals and coral reefs.

DEPARTMENT OF MERIDIAN ASTROMETRY. The meridian determinations of stellar positions at the temporary observatory at San Luis, Argentina, undertaken by this department in 1910 were finished in January, 1911. The deductions of the stellar positions and motions are proceeding in the computing section of the department at the Dudley Observatory, and the final catalogue giving precise positions of all stars up to the seventh magnitude, inclusive, will appear in due time.

NUTRITION LABORATORY. The staff of this laboratory were occupied during the year in the construction of new apparatus, in the improvement of apparatus already in use, and in numerous researches on pathological and normal subjects, and in the preparation and publication of reports on results already attained. Nine publications were issued. One of these gives the result of the important study of the variation of temperature in different parts of the human body. Another records experiments on men to determine the effects of breathing air rich in oxygen content.

SOLAR OBSERVATORY. Although the construction and equipment of the laboratory are still incomplete, members of the staff made progress during the year with their programmes of solar, stellar, and physical observations and of computation and deduction. The observatory is now equipped with four highly effective telescopes. Attempts to obtain a perfect disk for the 100-inch Hooker telescope have so far failed, but the manufacturers at St. Gobain, France, are now attempting to fit a disk hitherto unacceptable. See **ASTRONOMY**.

DEPARTMENT OF TERRESTRIAL MAGNETISM. The magnetic survey of the globe undertaken by this department proceeded effectively during the year on both land and sea. Observations of the magnetic elements of declination, dip, and intensity were made at numerous points on the continents

of Asia, Africa, Australia, Europe, South America, and in the Polynesian islands. The non-magnetic ship *Carnegie* secured during the year a large quantity of data of practical utility to navigation and of still greater importance in their relations to the general problem of terrestrial physics. The *Carnegie* during the year visited the ports of Rio de Janeiro, Montevideo, Buenos Ayres, and Cape Town, arriving at Colombo, Ceylon, June 11, 1911. This marked the completion of the first year out. As a result of the work of the *Carnegie* large errors were found almost everywhere except in the South Atlantic Ocean in the best compass sailing charts now in use.

RESEARCH ASSOCIATES. Between fifty and sixty research associates of the institution carried on investigations during the year. Two remarkable publications resulted from these investigations. One of these was a treatise on *Dynamic Meteorology and Hydrography*, by Prof. V. Bjerknes of the University of Christiania. The other is entitled *The Polynesian Wanderings*, by William Churchill.

Twenty-nine publications were issued by the institution during the year. The president is Dr. Robert S. Woodward.

CARNEGIE PEACE ENDOWMENT. See **ARBITRATION**.

CARNEGIE TECHNICAL SCHOOLS. A group of schools founded in Pittsburgh, Pa., in 1905 by Andrew Carnegie, with the object of placing a technical education of the most approved type within the reach of any youth who had the desire for such an education and lacked the money. To accomplish this, fees were set at a nominal figure and a liberal endowment was provided for the maintenance of the institution. The founder's original gift was \$1,000,000, but the demand for instruction has been such as to make frequent extensions necessary, and Mr. Carnegie has, in consequence, increased his benefactions from time to time until they now amount to \$4,000,000 for buildings and equipment and \$7,000,000 for endowment. The schools were first opened in 1905 with 753 students enrolled. The registration for 1910-11 was 2226, of which 1752 were men and 474 women. The faculty numbered 150 members and the productive funds amounted to about \$7,000,000, with an income of \$448,000. In 1910 Mr. Carnegie made further gifts of \$3,500,000 and a farm of 750 acres near Pittsburgh for use as an engineering camp. The schools included courses in engineering, and art and industrial instruction is given to both day and night classes. There are also courses for the education and training of women for the home and for the various professions and industries open to them. New courses in commercial engineering, illustration and painting, training for industrial teachers, and institutional management for women were established in 1910-11. The college grounds, covering thirty-two acres, are located in Schenley Park, a distance of about three miles from the business district of Pittsburgh. Several new buildings were in process of construction at the close of 1911.

CARNEGIE PRIZE. See **PAINTING**.

CAROLINE ISLANDS. A German possession (part of the German New Guinea Protectorate), made up of the Caroline, Pelew, and Marianne (Ladrone) islands (Guam excepted), all lying north of New Guinea. Area, about

THE ADMINISTRATION BUILDING OF THE CARNEGIE INSTITUTION OF WASHINGTON
WASHINGTON, D. C.

600 square miles. Estimated population, 55,000. Imports and exports (1909), 2,185,217 and 651,898 marks respectively. Estimated revenue and expenditure (1911), 703,000 marks (government subvention, 144,000). Administration (under the governor of German New Guinea) at Ponapé, the eastern capital (1911), Dr. Kersting; at Yap, the western, M. Baumert.

A native insurrection led to a German punitive expedition, and a naval brigade attacked a fortified post in Ponapé, held by the insurgents. The insurgents were driven out, but a lieutenant and a seaman were killed and three other seamen wounded. Later, however, several of the ringleaders surrendered, and by February 22 the punitive expedition, according to the press dispatches, was completely successful, having resulted in the capture of the entire tribe that had committed the outrages. Those who were found guilty of murder were shot, and the rest, numbering some four hundred, were banished to the island of Yap.

CARRERE, JOHN MERVIN. An American architect, died from injuries received in an automobile accident on March 1, 1911. He was born of American parents in Rio de Janeiro, Brazil, in 1858, and was educated in Switzerland, and studied architecture in the École des Beaux Arts in Paris, graduating in 1882. Returning to the United States he became a partner with Thomas Hastings in the firm Carrère and Hastings in 1884. This firm designed some of the most notable buildings in the United States, including the Ponce de Leon and Alcazar hotels in St. Augustine, Fla., the New York Public Library, National Academy of Design, and many other important buildings in New York City and elsewhere.

CARBOLL, JOHN LEE. An American public official, formerly governor of Maryland, died February 27, 1911. He was born at Homewood, near Baltimore, in 1830, the great-grandson of Charles Carroll of Carrollton. He was educated at Georgetown University and after studying law at the Harvard Law School was admitted to the bar in 1851. He was a member of the Maryland senate in 1867-71 and was elected governor of the State in 1876, serving until 1880. He was president-general of the National Society of the Sons of the Revolution.

CARTER, THOMAS HENRY. Former United States senator from Montana, died September 17, 1911. He was born in Scioto county, O., in 1854, and was educated in the common schools. In his youth he engaged in farming and in rail-roading, and for several years taught school. In 1882 he removed to Montana. He was a delegate to the Fifty-first Congress from the Montana Territory, 1889-1891, and upon the admission of the Territory to statehood he was elected the first representative to the same Congress. He was commissioner of the United States General Land Office in 1891-2. From 1892 to 1896 he was chairman of the Republican State committee. He was elected United States senator in 1895 for the term ending in 1901. He was defeated for reelection, but in 1905 was for the second time elected senator, serving until 1911. On the expiration of his term he was appointed a member of the United States commission to adjust the dispute in regard to the boundary waters between the United States and Canada. Senator Carter was for many years the strongest individual factor in Republican

politics in Montana. Had a Republican legislature been elected in 1910 he would undoubtedly have been its choice for senator. In spite of the Democratic majority he came very near to election by the aid of Democratic votes. Senator Carter was frequently mentioned as a possible cabinet officer. His most striking performance in Congress was the talking to death in a sixteen-hour speech at the close of the session a river and harbor bill, carrying appropriations aggregating \$50,000,000. This occurred on the night of March 3, 1901. President McKinley desired the bill killed. Senator Carter's term expired the following day at noon. He took the floor sixteen hours before adjournment and spoke continuously until Congress expired and the bill failed. Senator Carter was known in the Senate for the distinction of his English in debate.

CATHOLIC CHURCH. See ROMAN CATHOLIC CHURCH.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning under the auspices of the Catholic Church, at Washington, D. C., founded in 1863. The students in 1910-11 numbered about four hundred. The faculty numbered fifty-four. Two notable appointments to the faculty were Dr. Franz Cohn of the University of Bonn, professor of the Old Testament, and Dr. Paul Gleis of the University of Münster, professor of the German language and literature. During the year about \$100,000 in scholarship and benefactions were received by the university. The invested funds amount to about \$1,250,000. An engineering building was constructed for the departments of civil, mechanical, and electrical engineering. Two new departments, architecture and drawing, have been added to the school of sciences. On October 12 the cornerstone of the Gibbons Memorial Hall was laid. This will be a residence hall for lay students, to cost \$250,000. A new review was added to the university publications, the *Catholic Educational Review*. While the university is open to lay students in all sciences, except medicine, it is also a centre of studies for several important Catholic religious orders and associations, the Dominicans, Franciscans, Paulists, Mariists, Holy Cross order, Sulpicians, etc. The library contains 70,000 volumes. The rector is the Rev. T. J. Shahan, D. D.

CAWDOR, FREDERICK ARCHIBALD VAUGHAN CAMPBELL, Earl of. An English nobleman and public official, died February 8, 1911. He was born in 1847, the eldest son of the second Earl of Cawdor. He was educated at Eton and at Christ Church College, Oxford. From 1874 to 1875 he was a Conservative member of Parliament for Carnarvonshire. In 1892 he was defeated for Parliament and again in 1898. In the following year he succeeded to the title

on the death of his father. The first fifteen years of Lord Cawdor's active life was occupied with railway work. He was for several years chairman of the board of directors of the Great Western Railway. Under his direction many important changes were made in the management of this railway. In 1905 he succeeded Lord Selborne as first lord of the admiralty. He assumed office at a critical time in the modern history of the British navy. It was at the time of great changes which had been begun by Lord Selborne. These related to the organization, distribution, and equipment of the fleet. Lord Cawdor strongly supported the prosecution of these changes. In November, 1905, a few days before the resignation of Mr. Balfour as prime minister, Lord Cawdor issued a memorandum of "Admiralty Policy" which enunciated a ship-building policy in the following words: "At the present time, strategic requirements necessitate an output of four large armored ships annually." The issuing of this memorandum was his last public act as first lord of the admiralty, but he continued to hold a large place in naval discussions in the succeeding ministries. Upon the coming into power of the Liberal party, he took a prominent part in the debates of the House as a member of the Opposition, and exercised considerable influence in Unionist councils. He was closely associated with the movement among Opposition peers in favor of a reformed House of Lords. In 1910 he was chosen as one of the four Unionist leaders who took part in the conference on the Constitutional Question and he had an important share in the drafting of Lord Lansdowne's resolutions for the reform of the House of Lords.

CAYENNE. See FRENCH GUIANA.

CAYMAN ISLANDS. Three British West Indian islands (Grand Cayman, about 93 square miles; in 1909 5500 inhabitants; capital, Georgetown, with 2000 inhabitants; Little Cayman, 4½ square miles, 98 inhabitants; Cayman Brac, 15½ square miles, 900 inhabitants), administratively attached to Jamaica, but governed locally by a commissioner. The census of June, 1911, showed a total population of 5564 (2322 white, 2211 colored, 1031 black); Georgetown 1449. Coconuts, turtle shell, and hides are exported. Imports (1906-7), £28,000; exports, £16,000. Revenue (1909-10), £2979; expenditure, £3460; reserve fund, £2200. Commissioner (1911), George S. S. Hirst.

CEMENT. The total production of cement in all varieties in 1910 was 77,785,141 barrels, valued at \$68,752,092. In 1909 the production was 66,689,715 barrels, valued at \$53,610,563, or an increase in 1910 of 11,095,426 barrels, or 16.6 per cent. in quantity, and of \$15,141,529, or 28.2 per cent. in value. The total production is divided as follows: Portland cement, 76,549,951 barrels; natural cement, 1,139,239; puzzolan cement, 95,951 barrels. Among the States producing cement, Pennsylvania ranks first. In 1910 there were produced in that State 26,675,978 barrels, valued at \$19,551,268. In this State there were in 1910 twenty-five plants producing cement. Indiana ranked second, with 7,219,199 barrels; Kansas third, with 5,665,808 barrels, and California and Washing-

ton, 6,385,588 barrels. Other States producing between three and four million barrels were Illinois, Missouri, New Jersey, Michigan, and New York. The total number of plants producing cement in the United States in 1910 was 111, as compared with 108 in 1909.

Trade conditions in cement in 1910 were slightly better than in 1909, but prices were still far from satisfactory, especially in the Eastern States. The price per barrel in 1910 ranged from 72.7 cents in the Lehigh districts to \$1.38 on the Pacific Coast. There was more or less fluctuation in price during the year, the highest level being reached during the building season. The imports of foreign cement in 1910 amounted to 306,863 barrels. Nearly all of this was Portland cement. Exports amounted to 2,475,957 barrels, valued at \$3,477,987. The apparent consumption of Portland cement in 1910 in the United States was 74,380,857 barrels as compared with 64,378,397 barrels in 1909.

The production of Portland cement in Canada is coming to be an important industry. During 1910 there were produced 4,396,282 barrels. The average price per barrel was \$1.34. The import of Portland cement into Canada in 1910 was 349,310 barrels.

The cement industry in the United States during 1911 suffered from low prices and from a lack of coöperation among producers. In fact, it was stated that many of the smaller mills at the end of the year were in poor financial condition, as it was impossible to produce cement at 60 cents per barrel of 375 pounds, a low record-price that ruled for a portion of the year. Rumors of consolidations and combinations were circulated, but these were not universally credited, in view of the attitude of the United States government towards industrial combinations.

The low prices for cement, however, continued to stimulate the natural growth of the use of this product for construction, particularly in the Western cities of the United States, and even in the East there has been considerable growth in the use of concrete for structural purposes.

About 1,000,000 barrels annually of cement were being supplied to the Panama Canal under contract at about 68 cents per barrel, and this demand somewhat improved the business conditions in the industry. The production in 1911 considerably exceeded that of 1910, which amounted to 77,785,141 barrels, while at the same time the imports from abroad were declining so that in the fiscal year ending June 30, 1911, the imports amounted to 46,648 tons, as compared with 81,550 tons in 1910 and 96,187 tons in 1909. The largest imports come to the United States from Germany and Belgium.

During the year the amount of cement manufactured from blast-furnace slag showed the usual increase. In 1900 32,000 barrels were manufactured from this source, while in 1910 this had increased to over 7,000,000 barrels, equivalent to over 1,000,000 gross tons. In other words, this waste product of the blast-furnace was supplying some 10 per cent. of the total production of the United States.

During 1911 a joint committee to develop uniform specifications for cement held some important sessions. These conferences were participated in by a committee of the American Society of Civil Engineers, members of the

United States government departmental committee and members of the similar committee of the American Society for Testing Materials. These various committees came to an agreement on a uniform test in all respects except in regard to the test for preliminary set and for consistency. For this particular test the departmental committee, and particularly the delegates from the board of engineering, United States army, would not accept the Vicat needle test which is now incorporated in the American Society of Civil Engineers' tests and which the committee from that society insisted upon retaining. The various committees were not able to come to an agreement upon the subject, so that a uniform specification for cement-testing had not been achieved.

"CEMENT GUN." During the year considerable progress was made with an effective method of applying concrete without the use of forms. The new method was known as the "Cement Gun," and consists of two steel hoppers, from the bottom of which dry cement and sand or other materials are ejected by compressed air through a hose pipe. This hose terminates in a nozzle, to which another and smaller hose supplies water also under pressure. While the material is in motion the hydration of the cement takes place, and a mixture with the aggregate is shot upon the surface to be coated. The mortar shoots from the inside in the form of spray and at high velocity so that the coarser grains of sand at first rebound from the surface, and a thin film of fine cement mortar attaches itself. This serves as a plastic basis for the larger particles which become embedded in it. The mixture can be applied so that a coating of any desired thickness can be formed upon the film. The discharge of sand and cement can be regulated, and the machinery is driven by an air motor supplied from an ordinary compressed air supply. The claim is made in this new process that the hydration takes place preceding and immediately before a direct emplacement, so that it is held in the initial set, or crystallization on the surface to be protected, and not on the mixing board. The process has been applied during the year on the reconstruction of the Grand Central terminal yards, and in the lining of the inverted pipe siphons of the Catskill aqueduct a 2-inch covering of cement mortar was deposited. Also, on the Panama Canal the cement gun was found useful in protecting the decomposed rocks with a coating of cement, and thus preventing slides. This protection took the place of costly concrete rivetment on the famous Culebra Cut, and it was reported that most satisfactory results had been attained.

CEYLON. An island in the Indian Ocean; a British crown colony. Capital, Colombo.

AREA, POPULATION, ETC. Area, 25,332 square miles. Population 1901, 3,565,964; 1911, 4,109,-

470. Birth-rate (1909), 36.7; death-rate, 30.3 per 1000. Immigrant laborers (1909), 80,718. Colombo had (1901), 158,228 inhabitants; Galle, 37,316; Jaffra, 33,879. Schools (1909), 4072, with 302,638 pupils; government expenditure, £96,117. Buddhists (1901), 2,141,599; Hindus, 828,622; Mohammedans, 248,140; Christians, 362,018. The Buddhism of Ceylon differs materially in doctrine and practice from that of Tibet, China, and Japan.

PRODUCTION, COMMERCE, ETC. Area under cultivation (1908), 2,773,657 acres; pasture, 662,152. Area (1909) under rice, 678,194 acres; other grains, 104,554; tea, 535,691; coffee, 1769; cocoanuts, 1,035,863; rubber, 154,460; cinchona, 263; cinnamon, etc., 47,906; cacao, 36,324; tobacco, 15,108. Total quantity of rubber sold in 1908, 7808 hundredweight; in 1909, 13,621. Livestock (1909): 1,509,554 cattle, 96,335 sheep, 170,645 goats, 4042 horses, 97,148 swine. Plumbago mines in 1908, 648 (export, 516,316 hundredweight; 643,853 hundredweight in 1909); gem quarries, 3303. Gold, monazite, thorium, and mica occur. The pearl fisheries are leased to a company at a rental of Rs. 310,000 per annum. Revenue from salt sales (a government monopoly) in 1909, Rs. 1,520,648. Imports (1909), Rs. 133,782,127 (from Great Britain, 28,794,975); exports, Rs. 147,019,740 (to Great Britain, 83,202,405). Railways open (end of 1909), 576½ miles. The Madawachi-Manar branch in the northwest of the Island of Ceylon was the most important of the four lines under construction during 1911, as it was destined to become part of the future connection with India. The Ragama-Negombo branch in the west was being extended to Chilau, while the main line in the centre of the plateau was being extended about forty miles to Passara, and the southern line was being constructed to Ratuapura. Length of telegraph wires, 4292 miles; of telephone wires, 1200; post offices, 419.

FINANCE AND GOVERNMENT. The unit of value is the rupee (worth 33.44 cents). Revenue and expenditure (1909), Rs. 39,352,861 and Rs. 35,790,398. Public debt, £4,989,392 and Rs. 3,096,085.

The colony is administered by a governor (1911, Sir Henry McCallum), aided by executive and legislative councils.

The MALDIVE ISLANDS (seventeen coral islets), lying 500 miles west of Ceylon (population 30,000 Mohammedans), are tributary to the Ceylon government. They are governed by a hereditary sultan residing in the island of Mali.

CHADBORN, CHARLES L. An American inventor, died May 11, 1911. He was born in Newburg, N. Y., in 1834. He learned the carpenter's trade in that city, then removed to Albany as superintendent of the wood-working branch of a reaper and mower company. After several years he became associated in a concern that was making an English patent lawn-mower, at Fishkill, N. Y. In a short time he invented a light lawn-mower much improved over the English make and offered it to his employer, who decided not to take it up on the ground that it was too light and would never become popular. He succeeded in interesting several persons with small capital in the manufacture of the lawn-mower, but his health failed and he was compelled to abandon it. The business afterwards became a notable success

and the mowers were sold in all parts of the world.

CHAILLÉ, STANFORD EMERSON. An American physician and educator, died May 27, 1911. He was born in Natchez, Miss., in 1830 and graduated from Harvard College in 1851. He studied medicine and graduated from the University of Louisiana, now Tulane University, in 1853. In the three years following he studied medicine in Europe. From 1862 until 1865 he was surgeon and medical inspector in the Confederate army of Tennessee. From 1858 to 1862 of physiology, pathology, anatomy, and University and from 1868 to 1908 was professor of physiology, pathology, anatomy and hygiene in that institution. From 1908 to the time of his death he was professor emeritus. He was the author of *Origin and Progress of Medical Jurisprudence*. He was a member of many foreign and American medical societies.

CHAMBERLAIN, ABIRAM. An American public official, former governor of Connecticut, died May 15, 1911. He was born at Colebrook, Conn., in 1837, and was educated at Williston Seminary. He engaged in the banking business in 1863 and was president of several important commercial institutions in Connecticut. In 1877 he was a member of the Connecticut House of Representatives. In 1901-2 he was State comptroller and from 1902-1905 was governor of the State.

CHAMBERLAIN, HENRY RICHARDSON. An American newspaper correspondent, died February 15, 1911. He was born in Peoria, Ill., in 1859. He was educated in the public schools of that city. At the age of sixteen he went to work in a chemical laboratory in Philadelphia, but soon tired of this and began writing for newspapers. After a few years of miscellaneous newspaper work in Boston, he was appointed Boston correspondent to the *New York Sun*. In 1888 he became managing editor of the *New York Press*, but after a year resigned and spent some time in Europe. Following this he returned to the *Sun* and remained until 1891. In that year he became managing editor of the *Boston Journal*. In the following year he was made correspondent of the *Sun* in London, in which place he had general oversight of the *Sun's* news service in Europe. He acquired a remarkable knowledge of political matters in Europe and he reported many notable events, among them the disturbances in Macedonia, the particulars of the Panama Canal scandal, the political crisis in Russia in 1906, the Messina earthquake, the jubilee of Queen Victoria, and the coronation of King Edward VII. He published a novel entitled *Six Thousand Tons of Gold*.

CHARITIES AND CORRECTIONS, NATIONAL CONFERENCE OF. See CHARITY.

CHARITY. One of the most conspicuous features of modern social development is the great increase in the number and strength of movements for the benefit of the less fortunate members of society. So broad is this humanitarian movement that the very nature of charity is changing. The modern charitable and phil-

anthropic societies and associations do not, by any means, limit their activities to the relief of the poverty-stricken. This is clearly shown in the brief summaries of the various conferences which were held during 1911. Altogether there have been established annual conferences of charities and corrections in nearly two-thirds of the States. At these are discussed not only local problems, but also general principles and the larger bearings of social betterment movements. A Canadian conference has also been organized.

NATIONAL CONFERENCE OF CHARITIES AND CORRECTIONS. The thirty-eighth annual session of this conference was held at Boston June 7-14, in connection with a considerable number of other charitable and philanthropic societies. It was the largest assembly in the history of the conference, being attended by 1632 registered delegates, besides several hundred others. These delegates came from forty-six States and Territories, and from Hawaii, Japan, and China. The conference was divided into sections on the following subjects: Children; families and neighborhoods; law-breakers; standards of living and labor; housing, health, and recreation; drunkenness; the church and social work; and securing and training social workers.

The completeness of treatment in each of these sectional conferences may be indicated by the topics discussed in the first section devoted to children: Tendencies in the care of destitute and neglected children; sex hygiene; family desertion; social problems of rural children; medical inspection of school children; psychological clinics. So much interest was aroused over the subject of sex hygiene that it was decided to devote an entire section to that subject in the 1912 conference.

The next annual meeting of the national conference will be held at Cleveland, in the spring or early summer of 1912. The president is Julian W. Mack, Washington, D. C.; general secretary, Alexander Johnson, Fort Wayne, Ind. Committees have been organized for that conference on the following subjects: Public supervision and administration; children; families and neighborhoods; courts and prisons; standards of living and labor; housing and recreation; immigration; relation of medical and social work; sex hygiene.

OTHER BOSTON CONFERENCES. Almost simultaneously with the foregoing conference there met in Boston the following: The eighth annual session of the National Conference on the Education of Dependent, Backward, Truant and Delinquent Children, June 5-6; the National Conference of the Society of St. Vincent De Paul, June 4-7; National Conference of Jewish Charities; National Probation Officers' Association, June 6-13; Federated Boys' Clubs; the customary meeting of the Red Cross; the second annual meeting of the National Federation of Remedial Loan Associations, June 12-14; the National Association of Societies for Organizing Charity (see below); the National Conference of Settlements; the Conference of Public Relief Officials, June 7-13. Each one of these minor conferences comprised a considerable number of intensive studies, or authoritative reports on some topic of the modern philanthropic movement.

CHARITY ORGANIZATION. At the National Conference of Charities and Corrections at Boston was held the first annual session of The

National Association of Societies for Organizing Charity. This association had been temporarily organized at St. Louis in 1910, the organization being made permanent at Boston, with fifty-eight charter members. The form of organization is patterned after that of the International Committee of the Young Men's Christian Association. The plan contemplates two secretaries and a budget of \$10,000 for the first year; there is some expectation that the number of secretaries will be increased to four the second year, to eight the third year, to twelve the fourth year, and twenty the fifth year, and that the budget will similarly increase to \$100,000. The object is to organize an associated charities, or a charity organization society in every city of 10,000 or more population. The actual work of carrying on the organization propaganda will be divided between this new national association and the charity organization department of the Russell Sage Foundation.

The essential principles of organized charity, as stated by Dr. Edward T. Devine, editor of the *Survey*, are: Pains-taking inquiry so that action may be based upon knowledge; coöperation on the basis of knowledge; adequate, appropriate, persistent, and efficient action in individual cases, with a view to the removal of fundamental causes of dependency in so far as these are personal; concerted action upon the social causes of exploitation and misfortune, such as unsanitary housing, child labor, extortionate charges by pawn shops, social loan and chattel mortgage agencies, and uncompensated industrial injuries.

NEW YORK STATE CONFERENCE. The twelfth New York State Conference of Charities was held at Watertown, October 17-19. There were five principal subjects considered: Child labor, public health, housing, public institutions, and children. Very extensive discussion was given to the subject of public outdoor relief. It was proposed by one of the speakers to restore this form of relief in New York City, where it has not been used for more than thirty years. It was argued that private outdoor relief is inadequate, and that such relief is a proper function of the government. Robert W. Hebbard argued that private relief societies should have public funds placed at their disposal. This position was opposed by Mr. Frederic Almy of Buffalo, and Mr. Edward T. Devine of New York. Their objections were that the subsidizing of private charities leads to sectarian demands, lobbying, and log rolling for the public stipends. Throughout the conference there was a conspicuous and insistent demand for increased activities on the part of the State with reference to child labor, vagrancy, housing, and the care of defectives and delinquents. Speaking on the care and relief of the poor in their homes, Anna B. Pratt of Elmira stated that three countries in Europe have succeeded in eliminating the tramp, primarily by the use of compulsory and free labor colonies as in Switzerland. She stated that there were 500,000 tramps in the United States. A special plea was made for the assumption by the State of responsibility for vocational guidance and vocational education. It was argued that, in the interest of the industrial population, the public school system should be divided, after the elementary school, into three great divisions: High schools, business schools, and indus-

trial, agricultural, and home-making schools. The importance of sex education was emphasized by a number of speakers, and a programme for such education by mothers was set forth. With reference to the care of defective delinquents, it was pointed out that they do not properly belong in a reformatory institution for normal boys, and that they may not be transferred to custodial asylums, with the result that they are usually returned to their home communities where they again fall back into crime.

NEW YORK CITY CONFERENCE. In May was held a three days' New York City Conference of Charities and Correction. The president, Cyrus L. Sulzberger, declared that poverty still multiplies in spite of the extensive preventive activities of a quarter century; he declared the chief causes to be unemployment, industrial accident, disease, premature death, and low wages. William H. Allen declared that the city, having worked out a five years' plan for meeting the social needs of the city, is working more efficiently for municipal uplift than private philanthropy. Similarly, Comptroller Prendergast declared his belief that the city would become the greatest social worker, and also that social betterment expenditures were sound investments for public funds. Similarly, Mr. Benjamin C. Marsh argued for a considerable extension of the city activities in the care of the destitute and the unfortunate. He pointed out needed philanthropic activities which neither public nor private charity now carries on. One of the most striking contributions to the conference was the discussion of the quality of hospital workers. It was brought out that their present rate of pay ranges from \$5 to \$15 a month; that, in order to fill one thousand positions, some six thousand names must be entered on the pay roll each year, as a result of frequent dismissals for drunkenness. It was brought out that the present system has evolved from an early system of enforced work by prisoners. Demand for higher wages, as the only means of getting higher grade workers, was insistent. The committee on families summed up the obstacles to wholesome homes as congestion, low wages, intemperance, and lack of an enjoyable and stimulating social life. A plea for the municipal outdoor relief for widows and for deserted families was made. Considerable discussion was devoted to the folly of the present system of boarding children in homes other than their own, instead of subsidizing their own mothers. Several speakers urged the standardization of the treatment of children, either in general or in separate clinics. Maud E. Minor presented an authoritative treatment of the vexed question of women delinquents. She pointed out that neither fine nor workhouse avails against prostitution. She urged the organization of educational work, particularly upon farms, as a means of reconstituting such women. She also developed the need for a house of detention for women awaiting trial, the conviction of procurers, and the prevention of female delinquency by raising wages and the moral conditions of shops.

SOCIAL CENTRES. The first National Conference on civics and social centre development in America was held at Madison, Wis., October 25-28. This was organized by the Social Centre Association of America, and the extension division of the University of Wisconsin,

and was attended by nearly two hundred delegates. The civic, social, and educational sides of civic centres were discussed from numerous viewpoints. It was decided to hold a second conference at the University of Kansas in the fall of 1912. The officers elected were: President, Dr. Josiah Strong, New York City; secretary, Edward J. Ward, Madison, Wis.

SECOND ANNUAL CONFERENCE OF RURAL SOCIAL WORKERS. The Second Annual Conference of Rural Social Workers was held at Amherst, Mass., in August. Sections were devoted to the country clergyman; civic betterment; town administration; grange work; rural libraries; home makers and household administration; agricultural education; and the county Y. M. C. A. workers.

NEGRO AGENCIES. One of the advances in the organization of social betterment work among the negroes of America was the organization of the National League on Urban Conditions among Negroes, in October. This resulted from the combination of the Committee for Improving the Industrial Conditions of Negroes in New York, the National League for the Protection of Colored Women, and the Committee on Urban Conditions among Negroes. The objects of the league were stated as follows: To carry on constructive and social work among negroes; for improving their social and economic conditions in urban centres; to bring about coordination and coöperation among existing agencies working in the interests of negroes, and to develop other agencies where necessary; to secure and train negro social workers; to make such studies in cities as may be required for the carrying out of the objects of the league. Prof. E. R. A. Seligman was made chairman, Edward E. Pratt, secretary, and A. S. Frissell, treasurer. Branches were at once organized in Memphis, Baltimore, St. Louis, Nashville, and Louisville.

KANSAS CITY BOARD OF PUBLIC WELFARE. One of the most interesting features of the recent developments in charities and philanthropy is the increased activity of city departments devoted especially to such work. The charities department of New York City has greatly enlarged its plans and raised the level of its efficiency. The city of Milwaukee, also, has taken long steps in the direction of a broad social programme. But no city has as yet organized as comprehensive and thoroughgoing a plan as that formed in Kansas City. Its board of public welfare is divided into ten divisions: District superintendents; social service department; department for the homeless unemployed; welfare loan agency; municipal farm; women's reformatory; parole department; recreation department; legal aid bureau; research bureau. Among the principles which have guided the organization of this new venture were the following: Emphasis on justice rather than charity; prevention rather than cure; accurate knowledge preceding and accompanying all efforts to improve social conditions; coördination of all existing agencies, both public and private; no public outdoor relief except where the bread winner is a prisoner and the family in actual destitution. Although this is a municipal venture, use is made of a number of institutions already operating in the city.

SCHOOLS. The great interest in systematic charitable work which has developed so conspicuously in the last decade, has resulted in

the formation of a half dozen schools devoted to the training of social workers. The first of these, the New School of Philanthropy, was organized in 1898; then came the Chicago School of Civics and Philanthropy, in 1903, followed in 1904 by the Boston School for Social Workers, and in 1907 by the St. Louis School of Social Economy. Finally, late in 1910, were organized the Institute of Municipal and Social Service in Milwaukee, and the Philadelphia Training School for Social Workers. The first four of these schools are assisted by the Russell Sage Foundation. The Milwaukee Institute resulted from the combined action of a local committee, and the Extension Division of the University of Wisconsin. There was organized in 1911, the American Interchurch College, for religious and social workers, at Nashville, Tenn. This resulted from the effort to establish in the South a well-equipped, undenominational institute for the training of social and religious workers. Its board of directors is composed of representatives of several Protestant denominations. It is hoped that denominational schools will be established in connection with this college, making use of the latter's class rooms, auditorium, and gymnasium, as well as its courses in sociology, psychology, languages, music, manual arts, and housing economy. It is the first federated school in the United States for the preparation of church workers, social settlement workers, and directors of reformatories and associated charities. The college will have both white and colored departments.

INTERNATIONAL ASSOCIATIONS. The International Congress on Hygiene and Demography will meet in Washington, September 23-28, 1912. Its object is to extend and improve the knowledge and practice of hygiene, public health, and vital statistics. Its eight sessions will be devoted to hygiene of infancy, of childhood, and of the school; industrial and occupational hygiene; the control of infectious diseases; State and municipal hygiene; hygiene of traffic and transportation: military, naval, and tropical hygiene. The president of the congress is Dr. Henry P. Walcott of the Massachusetts Board of Health; the general secretary, John S. Fulton, of Baltimore.

The international committee of the Congresses of Public and Private Relief, at a session in Paris, July 3, fixed upon London and the year 1915 as the place and time for the next session. Topics for discussion will be: International arrangements for regulating relief given to children who are indigent or neglected; the relation of provident methods to relief; the relief of families of extradited prisoners.

The fifth Annual Congress of Public and Private Relief of France met at Nantes, July 3-8. The subjects considered included the relations of charitable relief to the new old-age pension system; the protection of children against moral corruption; district nursing; and the relief of families in times of public calamity.

CHATHAM ISLANDS. A dependency of New Zealand (q. v.).

CHAUTAUQUA INSTITUTION. A system for the advancement of popular education, founded at Chautauqua, N. Y., in 1874, by John H. Vincent and Lewis Miller. In addition to the C. L. S. C. reading work, which is done at the homes of readers all over the English-speaking world, the summer activities of the institution are carried on by means of a general assembly, meeting for sixty days in July and August, and the series of summer schools. Admissions to the assembly grounds in 1911 aggregated over 51,000, and the estimated number of residents from about July 15 to August 15 was in the neighborhood of 13,500. During these sixty days an average of six major events—devotional hours, lecture series, special addresses, readings, recitals, concerts, illustrated lectures, entertainments, and annual events—were presented, and during these same days an average of twenty minor conferences, club meetings, etc., took place daily. The Chautauqua summer schools include the classes in English, modern and classical languages, psychology and pedagogy, mathematics and the laboratory sciences, religious teaching, library training, domestic science, music, expression, arts and crafts, physical education, and business training, and enrolled slightly under 3200 students, who were taking instruction from a faculty of about one hundred members, drawn from the leading universities, colleges, and normal schools of the country. The season as a whole was marked by a slightly larger attendance than any of the preceding thirty-seven, and justified the present plans for extension of the work in all departments, but for 1912 especially in the school of music, school of religious teaching, school of pedagogy, and the school of practical agriculture.

CHAWNER, WILLIAM. An English educator, master of Emmanuel College, Cambridge, died March 29, 1911. He was born in 1828 and was educated at Emmanuel College. He was vice-chancellor of that college from 1899 to 1901 and was master from 1895 until the time of his death.

CHEESE. See DAIRYING.

CHEMICAL SOCIETIES. See CHEMISTRY, INDUSTRIAL.

CHEMICAL SOCIETY, AMERICAN. See CHEMISTRY, INDUSTRIAL.

CHEMISTRY. The volume of published work in the various fields of chemistry has been larger in 1911 than in any previous year. Most of this material may be likened to mere sentences, or at most paragraphs, in great chapters of chemical research. Far-reaching generalizations, like important discoveries, are seldom made, and then often fail of recognition till many years have passed. Unless seen in perspective, it is difficult to determine what will really prove of importance; the first paper on the Röntgen ray seemed of little significance, yet led to a revolution in fundamental conceptions of chemistry. In this article a few only of the many advances in the science can be touched on. One of these, Werner's discovery of inorganic stereo-isomerism, is a notable step in the chemical history of 1911.

ATOMIC WEIGHTS. A rather large amount of work has been done in the past year on the more exact redetermination of these physical constants, but only six changes have been made in the annual table issued by the International Commission on Atomic Weights. The most important of these is that of mercury, for which the number 200 has for ten years been used. Easley has analysed mercuric chlorid electrolytically by the use of a mercury kathode and obtained the figure 200.63, confirming earlier work of his, and later this result was again confirmed by his analysis of mercuric bromid. On the strength of this work the international commission has adopted 200.6 for the atomic weight of mercury. For iron, 55.84 is chosen in the place of 55.85, based on the work of Baxter on ferrous bromid. One of Baxter's series of determinations was carried out on iron obtained from the "Campas" meteorite, which fell in Mexico in 1903. The results found were the same as when he used ordinary iron, thus showing no difference between the metal from celestial and that from terrestrial sources. Work by Richards on calcium chlorid and calcium bromid has led to the figure 40.07 in the place of 40.09 for calcium. By conversion of tantalum pentachlorid into the oxid, Balke found the atomic weight of tantalum to be 181.52, which the commission rounds off into 181.5, in the place of the former 181, but later work by Chapin and Edgar F. Smith points to a figure higher by several tenths of a unit. McAdam has obtained the ratio between sodium metavanadate and sodium chlorid by heating the former in dry hydrogen chlorid, and from this computes the atomic weight of vanadium as 50.967. The commission has adopted the number fifty-one, instead of 51.06, as used in 1911. It is to be noted that all of the above work on atomic weights has been done in American laboratories, and published in the *American Journal of Chemistry*. By most careful purification, Hofmann has prepared erbium which appears to be homogeneous, both from gravimetric and from spectroscopic standpoints, and this neo-erbium, as he calls it, has an atomic weight of 167.68; therefore the commission has taken 167.7 as the figure to be used for erbium, in the place of 167.4. In the table for use in 1912, *niton*, symbol Nt, for the first time appears as an element. This is the name suggested by Ramsay and Gray for the emanation given off by radium. The density of this emanation was measured in 1910, by viscosity methods, by Debierne, and from this its atomic weight was 220. Although the amount of niton at the disposal of Ramsay and Gray was only a few cubic millimeters, yet they made five determinations of its atomic weight by actually weighing it on their marvelously sensitive micro-balance. The values obtained were in quite close agreement and averaged 223, though the number 222.4 is preferred by them. This is very close to the figure which was determined by Debierne by an entirely different method. The element niton is an inert gas, and is the highest member of the argon family. Numerous other atomic weight determinations have been made during the year, but in each case the number now in use has been confirmed.

NEW ELEMENTS. The search for new elements always possesses a certain fascination, but few searchers are rewarded by success. Most new elements, indeed, are discovered unexpectedly

and a large proportion of supposedly new elements turn out to be neither elements nor new. Unsuccessful attempts to decompose existing elements into constituents are, however, often very valuable in proving the homogeneity of the supposed complex. For example, Fisher and Froboese have recently purified argon by fractional crystallization, using liquid air as a cooling medium, and they find no sign of any other element being present. The atomic weight of the purified argon remains as before, 39.9, eight-tenths of a unit higher than that of potassium, while from its place in the periodic table it should be lower. The cause of this anomaly still remains to be explained. James, after 15,000 operations, has failed to detect by fractional crystallization any evidence of the complexity of thulium. Last year Flint set forth strong reasons for believing that he had decomposed tellurium into two elements, much to the satisfaction of chemists, who hoped that thus the anomalous atomic weight of this element would be explained, but later work by Harcourt and Baker fails to confirm the conclusions of Flint. Doubt has also been thrown on the existence of nipponium, a new element reported two years ago by Ogawa. On the other hand, Urbain announces the separation from the gadolinite earths of a new element, which he has named *celtium*, symbol Ct. Its oxid belongs to the already long list of "rare earths," and appears to be in its properties closely related to lutecium. The discovery of a new element of the platinum group has been reported from British Columbia, but this has not yet been confirmed.

ELEMENTS. Pure boron has been prepared, probably for the first time, by Weintraub, and its properties have been investigated. It proves to be nearly as hard as the diamond and it fuses only above 2000° Centigrade. Its most remarkable property is the increase of its electrical conductivity with the temperature. In the cold it is a very poor conductor, its specific resistance being 10^{12} times that of copper, while at 400° C. this resistance has decreased in the proportion of 12,000,000 to one. It is suggested that this property may give it important industrial applications. Pure cerium has also been prepared and its properties studied by Hirsch. The process used for the preparation was the electrolysis of the fused chlorid, rendered conducting by the presence of small quantities of alkali chlorids and fluorids. The metal was purified by forming an amalgam and then distilling off the mercury in a vacuum. Metallic cerium is rather soft, malleable, and very ductile. It has a specific gravity of 6.92 and melts at 635°C. No definite crystals of the metal could be obtained, but the interior of cerium ingots was highly crystalline. Its most marked chemical property is the ease with which it is attacked by reagents, most acids and many salts acting upon it, often vigorously, in the cold. Heated in the air it takes fire at 160°C. Many of its alloys were studied by Hirsch, but the only ones possessing particular interest at present are those with iron and with magnesium. The pyrophoric character of the cerium-iron alloy has been known for some time and has of late been widely used in cigarette-lighters. The alloy used is not homogeneous, and its peculiar property seems to be due to the scratching off of minute particles of the cerium present, which are by the friction heated high

enough to ignite. The cerium-magnesium alloy is also highly pyrophoric and very brittle. As it is also endothermic it would seem to promise valuable applications in thermal reductions. Now that tungsten and molybdenum have been prepared in coherent form these metals in wrought condition are revealing many valuable properties. It has been found possible to draw tungsten wire down to 0.0008 inch in diameter and these wires are finding great application as filaments in incandescent lamps. The very high fusing point of both these metals gives them valuable applications for electric-resistance heating. The melting point of tungsten is more than a thousand degrees above that of platinum, and at the same time it is much cheaper, so that it may be expected to replace the latter metal for many electrical purposes. Owing further to its high specific gravity and heat conductivity and the fact that at high temperatures it vaporizes least of all the metals, it is particularly valuable as target in the X-ray tube. Should it become cheap enough it would prove an ideal material for projectiles. A curious property of metallic thorium is described by Werner von Bolton, who found that small animals, like the amphioxus, can live much longer in water to which metallic thorium has been added, than in its absence. On the other hand, the metal appears to be injurious to vegetable life, so that possibilities are here suggested of destroying bacterial growths on animal life without harm to the animal. In the last Baker lecture before the Royal Society, Strutt described a new chemically active form of nitrogen, formed when pure nitrogen is submitted to the action of the electric spark. This modification is characterized by a luminescence which persists for a short time after the discharge has ceased. Unlike ordinary nitrogen, which is very inert, this form is very active, and unites directly with many elements, such as mercury, phosphorus, and iodine. The compound which it forms in its union with mercury is explosive. These two forms of nitrogen remind us of the two forms of phosphorus, the element which stands closest to nitrogen in the periodic table. Red phosphorus is inert, while yellow phosphorus is chemically very active. The same is true of oxygen, for in its ordinary form and when pure it is at ordinary temperatures inert, while in the form of ozone it is active. The two forms of nitrogen may thus also be due to a different number of atoms in the molecules of the two forms, or, as is perhaps more probable, the active modification of nitrogen may be the element in atomic form.

COMPOUNDS. Among the multiplicity of new compounds which have been prepared the past year, two many be mentioned which were needed to fill gaps in the application of chemical theory. Carbon ditellurid, CT_2 , which corresponds to carbon disulphid and carbon diselenid, has been prepared by Stock. It is exceedingly unstable, gives a golden-yellow solution in carbon disulphid, and is characterized by an intolerably suffocating odor. This confirms the analogy between tellurium and sulphur, which has of late been called in question by some chemists. The other compound is a selenite of quadrivalent manganese, $\text{Mn}(\text{SeO}_3)_2$, prepared by Marino by the action of selenium dioxide on manganese dioxide. When sulphur dioxide acts on manganese dioxide instead of a sulphite of quadrivalent manganese, a dithionate of bivalent manganese is obtained.

This has the same empiric formula, and many suppose that the sulphite is actually first formed, but it has never been isolated. Marino's compound, however, shows all the properties both of a selenite and of quadrivalent manganese, and is the first salt to be prepared of quadrivalent manganese with an oxy-acid.

WERNER'S THEORY. The application of Werner's theory of the constitution of inorganic compounds has proved in recent years of great value in the investigation of the complex compounds of inorganic chemistry. With little question the most brilliant piece of work in the whole field of chemistry the past year is that of Werner himself in confirming experimentally the theoretical deductions to be drawn from his views regarding a possible inorganic stereo-isomerism. It is worth while to trace rapidly some salient points in the development of his theory. For many years Werner has been engaged in the study of the so-called "complex" compounds of inorganic chemistry, and especially of that class known as the metal-ammonia bases, compounds which contain a number of ammonia groups in the molecule. (For example: $\text{Co}(\text{NH}_3)_6\text{Cl}_2$). Chemists have attempted for several decades to account for the structure of these compounds by the theory of valence, but with little success. This tool, which proved so valuable in studying the compounds of organic chemistry, appeared worthless here. In 1893 Werner first suggested the idea that in these compounds the ammonia groups are arranged around the central metal atom, giving what he called a coördinated group, which acted as a unit, generally indeed as an ion, the valence of which depends upon that of the central atom. This idea was soon applied to a large number of other classes of compounds, in which other groups or atoms replaced the ammonia. Thus, from this standpoint, water of crystallization, which has always been a bugbear to the valence theory, is often merely a part of the coördinated group. So also the "double" salts, such as ferrocyanides, chloroplatinates, fluosilicates, and even the alums, may be accounted for by what has been called "Werner's theory," or sometimes "Werner's hypothesis." The number of groups or atoms thus coördinated around the central atom appears to be never greater than six, though in many compounds it is less. If there are six such groups and they are symmetrically arranged, we shall have the figure of an octahedron, with the metal atom in the centre and the coördinate groups at each of the six corners. This naturally carried us back in thought to the early days of the first application of structural chemistry to explain the compounds of carbon. That the atoms within the molecule have a definite arrangement was, from both theoretical and practical standpoints, the most fruitful idea introduced into chemistry since Dalton's first suggestion of the atom itself, and we see, at once following, the wonderful development of organic chemistry. The culmination of structural organic chemistry was the connection between optical activity and the asymmetrical carbon atom, that is, optical isomerism. Werner's theory, if well founded, should lead to a similar development of the structural chemistry of inorganic compounds, and such has proved to be the case. It has led to a search for isomers, that is, compounds which have the same atoms in the molecule, but differently ar-

anged, and hence possessing different properties. In accordance with the theory, numerous predicted types of isomerism have been discovered. Three of these cases may be noted. The first is where an atom (or group), which is a part of the coördinated group, exchanges places with an atom outside this group. For example $[\text{ClNO}_2\text{Co}(\text{NH}_3)_5]\text{Br}$ and $[\text{BrNO}_2\text{Co}(\text{NH}_3)_5]\text{Cl}$. Many such cases are known. In a second case, when the central atom of a coördinated group is surrounded by two atoms (or groups) of one kind and four of another, if the octahedral arrangement represents the truth, it should make a difference in the compound whether the two similar atoms are at opposite or at contiguous corners of the octahedron. There should thus be two distinct compounds of the formula $[\text{Cl}_2\text{Co}(\text{NH}_3)_4]\text{Cl}$. One called *trans*-, in which the two chlorine atoms are on opposite sides of the cobalt atom, and the other *cis*-, with these two atoms on the same side. The fact that these two compounds do exist, for they have been known for half a century, has hitherto been impossible of satisfactory explanation. The third type of isomerism is that which was discovered by Werner during the year 1911. Practically all organic substances which are optically active in polarized light have an asymmetrical carbon atom, that is, a carbon atom to which are attached four different groups. These four groups may be arranged about the carbon atom in two ways, not alike, but each like the image of the other in a mirror, or like a right and a left glove. While such substances as are made in nature are generally optically active, those made in the chemical laboratory are generally inactive, because they contain equal numbers of each kind of molecule, those which are dextrorotary, and those which are levorotatory. Pasteur showed that these inactive substances (called racemic) can often be split into their active constituents by combining them with other optically active compounds, as well as by other means. Now if four points of Werner's octahedron be occupied by two bivalent groups, and the other two corners by different atoms or groups, as for example

there will be two possible asymmetric arrangements, which will be mirror images of each other, and it would from the analogy of organic substances be expected that they would be optically active, one dextrorotatory and the other levorotatory. Werner accordingly prepared a considerable number of compounds of this type, some containing cobalt and others chromium as the central atom, and actually found it possible to split them by the method above mentioned into components which showed opposite and equal optical activity. In some respects this is even more remarkable than the work of Pasteur and van't Hoff, since they were hunting a theory to account for known facts, while Werner was experimenting to find facts which should support and confirm his theory.

Until recently Werner's theory has failed to give aid in elucidating the complex acids of molybdenum, tungsten, etc. Through the efforts of Miolati and especially of Rosenheim, these compounds, such as the familiar phosphomolybdates and phosphotungstates, give promise of yielding up their secrets. The phosphomolybdates, for example, appear to be derived from

a phosphoric acid, $H_3(PO_4)$, (here in the co-ordinated group, PO_4 , it is the phosphorus atom which has six oxygen atoms grouped around it) in which the oxygen is replaced by the bivalent group MoO_4 or Mo_2O_7 . An obstacle in the way of this view has been that phosphomolybdic acid is evidently tri-basic, while this theory would demand that it should be septi-basic, since there are seven replaceable hydrogen atoms. Miolati had already found by physico-chemical methods that free phosphomolybdic acid gave evidence of a higher basicity than three, and now Rosenheim has succeeded in preparing a guanidinium salt of this and similar acids, in which the acids are actually septi-basic, and all seven hydrogen atoms are replaced by guanidinium, yet the salts are neutral. This is a remarkable confirmation of the theory.

RADIO-ACTIVE ELEMENTS. The question whether niton (radium emanation) can be influenced in its rate of decomposition by physical or chemical forces has been again investigated by Rutherford, and his former negative results confirmed. The half value of its decomposition period is found under all conditions to be 3.846 days. This is in remarkable agreement with the figure obtained by Madame Curie, which was 3.85. Rutherford followed this decomposition for more than a hundred days, at the end of which time the activity had decreased to less than 0.00,000001 of its original value. Rutherford and Boltwood further determined with great accuracy the amount of helium formed from radium. This had been found by Dewar in one experiment to be 182 cubic millimeters per year from one gram of radium, while in another experiment he found 169 cm^3 . The theoretical amount, calculated from the number of alpha-particles given off, is 158 cmm. In one experiment Rutherford and Boltwood collected the helium given off from 192 mg radium in eighty-three days, and in their second experiment that from the same radium in one hundred thirty-two days. In each case they found the amount to be 156 cmm per year from one gram radium, an exceedingly close agreement with the amount theoretically required. The helium production from niton was also determined, and an effort made to measure that from a layer of polonium deposited on metallic copper. In this last case only one-fourth of the theoretical amount of helium was obtained, the largest portion being occluded in the copper, from which it could be removed only by heating to redness. From the experiments of Fajans it seems probable that *radium C* decomposes not only into *radium D*, with a half-period of decomposition of nineteen and one-half minutes, but also into another product, provisionally called *radium C₂*, which has a half-period of only one and one-half minutes. Fajans suggests that actinium may be a decomposition product of *radium C₂*. It seems probable from our present knowledge that in the decomposition of uranium, eight helium atoms are ultimately given off, and that the end product of this decomposition is lead, intermediate products being ionium, radium, niton, etc. Several years ago Boltwood found lead present in all uranium minerals, and its amount varied with the age of the mineral. Holmes has now investigated a large number of earlier rocks from this standpoint, and finds in Devonian and Silurian rocks, from 340 to 430 million years old, the lead-uranium ratio is from 0.041 to 0.053. In

thorianil from Ceylon, approximately 1640 million years old, the ratio is 0.200 that is, five times as great as in rocks only one-fifth as old. Pirret and Soddy have found in the pitchblende from Joachimsthal, the present great source of radium, the ratio of uranium to radium is 1 to 3.15×10^7 , exactly the theoretical value calculated by Mlle. Gleditsch. The influence of niton, or more accurately, the influence of the energy liberated by its decomposition, on chemical reactions is being studied by Lind. The only results thus far published are on the system, hydrogen-bromin-hydrogen bromid. The union of hydrogen and bromin in the gaseous state is somewhat accelerated by the presence of radium, which furnishes the niton, while the decomposition of hydrogen bromid seems to be uninfluenced. In liquid, anhydrous condition hydrogen bromid is decomposed slowly, and about 3.5 per cent. of the total energy of decomposition of niton is thus changed into chemical energy. Aqueous solutions of hydrogen bromid are rapidly decomposed by niton and the same is true of solutions of potassium bromid. The more concentrated the solutions the more rapid the decomposition, but this is not proportional to the concentration.

SOLUTIONS. The fact that solutions of electrolytes increase in conductivity with rise in temperature has long been recognized, but there has been little exact investigation as to the cause of this rise. The diminished viscosity of the solvent with the rise in temperature is undoubtedly an important factor in determining the large positive temperature coefficients of conductivity, but from studies of Jones and West it would seem that the decreasing mass of the ion with rise in temperature is a much more important factor. This decreasing mass of the ion is due, according to the solvate theory proposed by Jones, to the fact that the ion, which at low temperatures carries with it often a very considerable number of molecules of the solvent, can hold fewer of these molecules as the temperature rises. To determine this effect West and Jones have measured the conductivity of a large number of salts in aqueous solution, where the attached molecules of the solvate are water, at temperatures ranging from 35° to 65° C., temperatures at which comparatively few conductivity determinations have been made. According to the solvate theory, those ions with the greatest solvate-forming power should have the largest temperature coefficients of conductivity, since the more complex the solvate the greater the change in this complexity with the temperature, and the greater the change in the mass of the ion, the greater the change in its velocity with a constant driving force, and consequently the greater the change in conductivity with rise in temperature. Further, ions with equal solvate-forming power should have temperature coefficients of the same order of magnitude, though since some ions hold the solvent more firmly than others they would not be expected to have exactly equal temperature coefficients. And again, the greater the dilution the more complex the solvate formed about the ion, and the greater the change in complexity with the temperature. Hence temperature coefficients of conductivity should be greater the higher the dilution. All of these theoretical conclusions were abundantly confirmed by the conductivity measurements of West and Jones, and lend strong probability to the correctness of the

solvate theory. The fact that salts of strong bases or acids, that is, good electrolytes, do not obey the law of mass action in their ionization has long been a source of perplexity. From a study of salts which decompose into two or three ions it has appeared that the concentration of the un-ionized portion of the salt, instead of being proportional to that power of concentration of the ionized portion represented by the number of ions into which the salt is decomposed, as would be required by the law of mass action, is actually proportional to a power which is nearly constant in all cases, regardless of the number of ions. Thus, in a salt which decomposes into two ions, the exponent should be two, in one giving three ions, three, etc. Instead, this exponent with all salts thus far investigated has a value between 1.40 and 1.55. It was a matter of great interest to determine if this holds with salts which give a larger number of ions. This has been done by Noyes (A. A.) and Lombard. The tetrasodium and the penta-sodium salts of benzenepentacarboxylic acid, which can be obtained in a very pure condition and which show practically no hydrolysis in solution, were chosen for the investigation. It was found that here, where there are five and six ions present in the solution, the value of the exponent is 1.5, like that of salts giving two and three ions. Further it has been found that at any definite concentration the un-ionized portion of a salt is roughly proportional to the products of the valences of the ions of the salts, but this had been little investigated for salts giving more than three ions. Noyes and Lombard found in the two salts studied by them that the same rule is applicable. This work broadens very much the generalizations regarding the ionization of good electrolytes, and paves the way a good deal further than has previously been done toward a comprehensive theory. The same may be said to a greater or less degree of a large part of the work that is being done in physical chemistry today. The volume of the work is large, but the methods of physical chemistry have been used relatively few years, and the data thus far accumulated are not sufficient for the establishment of fundamental theories, great as the progress has been. It is but a few years since the atom was looked on as an indivisible, impenetrable, unchangeable mass, no atom of one kind having any relation to atoms of any other kind. Indeed, the very existence of the atom has been called in question. To-day the atom has been rehabilitated, and has become but a stepping-stone to a deeper chemistry. No longer indivisible, it is recognized to be of the highest complexity, and the secrets of its structure are being sought. No longer unchangeable, some of the atoms are actually followed in their decomposition, as radium, and the question is being asked whether perhaps all the atoms may not be slowly resolving themselves into simpler elements. It is probable that to this structure of the atom we must look for the cause of many fundamental conceptions, chemical affinity, valence, ionization, light emission, and others, familiar in their phenomena but still unknown in their origin. This is a part of the task of chemistry to-day.

CHEMISTRY, INDUSTRIAL. The progress of industrial chemistry continues with increasing activity. (The features that are most conspicuous are improved processes, and the per-

sistent struggles after artificial or substitute products that are cheaper and better than those now in use as has been noted in the articles on industrial chemistry in recent volumes of this YEAR BOOK.)

ORGANIZATIONS. The American Chemical Society, with a membership of over 5700, held two general meetings during the year. The first was in Indianapolis, Ind., during June 28-July 1, and the second in Washington, D. C., during December 27-30. The president is Alexander Smith of Columbia University. In April a Connecticut valley section with headquarters in Hartford, Conn., was authorized. The Perkin medal for 1911 was awarded to Charles Martin Hall for his inventions and discoveries in connection with the manufacture of aluminum.

The American Institute of Chemical Engineers held two meetings during the year, one, in Chicago, Ill., during June 21-24, and the other, the annual meeting, in Washington, D. C., during December 20-23. Its president is F. W. Frerichs, St. Louis, Mo.

The dedication of the Chemists' Club of New York City with its occupancy of a new eleven-story building containing auditorium, library, museum, laboratories, offices, social rooms, living quarters, and restaurant at 51 East Fortieth Street, took place on March 17-19, with suitable meetings and functions.

The thirtieth annual meeting of the Society of Chemical Industry of Great Britain was held in Sheffield, during July 12-13. The membership was reported as 4300. Rudolph Messel was elected president in succession to Walter F. Reid.

The Emperor William Scientific Research Foundation established by gifts solicited by his majesty which amounted to \$2,500,000, was formally inaugurated at the University of Berlin, on January 11. The foundation will be used for the maintenance of two chemical research institutes, annexes of the university.

The eighth International Congress of Applied Chemistry will be held in Washington, D. C., on September 4, 1912, and in New York City during September 6-13, 1912, under the patronage of the President of the United States. The honorary president is Edward W. Morley; president, William H. Nichols, and secretary, Bernhard C. Hesse.

METALS. Aluminum is now used in iron and steel works for removing oxygen from the oxides of iron and other substances, the heat generated being so great as to raise the temperature of large bodies of iron. It also has the power of combining chemically with those gases imprisoned during the cooling of the metal, thus preventing porosity. For such purposes the metal is used either in the form of an alloy known as ferro-aluminum or as the pure metal. This property of keeping molten metal hot or of raising the temperature of a molten metallic bath has been utilized in the thermit welding process. In this process aluminum and iron oxide are intimately mixed in a finely divided state and ignited by means of a fuse. The heat of combustion in the ensuing reaction raises the temperature of the casting to the welding point. A new product is bimetallic tubing, which is made of aluminum and steel with the outer sheet of aluminum and the inner of steel, or *vice versa*. The same

combination may be made with aluminum and copper.

The use of titanium in making steel rails has increased considerably, and a railroad in this country which has given rails treated with ferrotitanium a long trial reports that they are proving entirely satisfactory. The use of titanium in arc-light electrodes is also growing. Of these there are two principal types, one of which is an electrode made of finely ground titanium carbide, the other is composed of magnetite, chromium oxide, and rutile.

Tungsten, like chromium, is not malleable, and it possesses hardness and brittleness but not ductility in ordinary or heated conditions. It has been discovered that if the metal is worked while hot, as by hammering, rolling, drawing, or the like, it progressively changes, and after a certain amount of working takes up such molecular structure or characteristics as permit mechanical working at room temperatures. In fact, under such treatment it becomes so ductile as to allow of bending, rolling, and drawing, either at ordinary temperatures (say 20°C.) or hot, as may be preferred. Hence its growing application for electric lamp filaments.

METALLURGY. The discovery of a valuable ore called "calafatita," which is a double sulphate of aluminum and potassium, near Almería, in Spain, is important. It is thought that this discovery may bring about a revolution in the sulphate of soda market, which has up to the present been monopolized by the Germans.

A new process of steel manufacture is announced as being successfully operated at plants in Sweden, Scotland, and Germany. The principal advantages of this process are: (1) the construction and working of the furnace is simplified; (2) the heat of the furnace can be controlled more quickly and more exactly in the open hearth than with ordinary firing; (3) intermittent working is facilitated, the furnace being quickly brought to full heat after standing idle; (4) the charge can be melted and treated more quickly than by the ordinary method, hence the output of a furnace of a given size is increased and the cost of labor reduced; (5) the charge can be kept in a perfectly liquid state throughout, so that it is not necessary to use the last of the contents of the furnace for ingots. One of the most remarkable qualities of this steel is that it shrinks only half as much as ordinary cast steel. Thus, a product equalling crucible steel can be produced in the open-hearth furnace.

During recent years there has been complaint of the "stripping" or "peeling" of the silver from the electroplated articles of the best quality. A series of prolonged investigations has led to the conclusion that the "peeling" is not due to insufficient plating, but to the high content of nickel in the basis metal; that ordinary commercial alloys of copper, zinc, and nickel, containing more than fourteen per cent. of nickel, are of doubtful utility; and that the tendency to strip increases with the thickness of the silver deposit. The properties considered in deciding upon the grade of German silver to be used as a basis metal for electroplating were strength, color, and malleability. However, where thick coatings of silver are concerned whiteness should not be considered as a matter of such prime necessity as the perfect adherence of the silver under conditions of wear, since strength is of more importance than color.

A recent Australian invention to overcome troubles of corrosion and pitting in metals, especially boilers, due to electric chemical action of ingredients in water with which they are brought in contact, appears to have met with success. The plan of the invention is to introduce by dynamos weak electrical currents on to the metals intended to be protected, thus neutralizing the galvanic action of the corrosive substances contained in the water. The process can be worked from any electrical installation already in use, the amount of electricity required being extremely small and such as can be easily regulated. The process is intended to be specially used, not only for protection of boilers, but also for protecting condensers, digesters, feed-water heaters, tanks, tail shafts, stern frames of ships, etc.

ALLOYS. Improved alloys showing lightness and increased strength are of frequent invention. Concerning aluminum alloys it is said that: The result of adding aluminum to copper is to cause an immediate increase both in the strength and in the ductility of the copper. The ductility attains a maximum at 7.35 per cent. aluminum. Beyond that it falls and when eleven per cent. is reached the alloy becomes too brittle to be of any commercial value. Heat treatment has little effect upon alloys containing less than 7.35 per cent. aluminum. Beyond that they are stiffened by heat treatment at 800°C. Alloys containing less than 7.5 per cent. aluminum are not amenable to cold working, though they are improved by hot rolling, while higher alloys are much improved by either hot or cold working.

A new alloy is Liege metal. It is said to be forty per cent. lighter than aluminum and has a density of 1.762. Its surface is grayish-white, reflecting rays analogous to those of poorly worked aluminum. Its composition is: Aluminum, 0.04 per cent.; iron, 0.01 per cent.; zinc, 0.44 per cent.; sodium, 0.21 per cent.; magnesium, 99.3 per cent.

"Vanalium" is an alloy said to be only three per cent. heavier than pure aluminum, and to have high tensile strength, good working qualities, and other properties which would seem to make it specially useful for machine parts where lightness and strength must be combined.

H. R. Hatfield has invented an iron alloy called "stalloy" which contains 3.4 per cent. silicon, and has as its special properties high specific electric resistance and high permeability.

RADIUM. Interest continues in this important element, especially as during the year the discovery of its ore in South Australia, near Mount Poynter, is reported. The deposit is said to be of high-grade ore and is described as uranophane, a hydrous silicate of uranium and calcium. Uranophane is regarded as a product of pitchblende, and when pure contains 67 per cent. of uranium trioxid. Another locality where radium-bearing ores have been discovered is the Wodgina region in the Pilbarra gold-field district, in Western Australia. A new ore of uranium has been found here, called pilbarite. It is of an ochreous yellow to lemon-yellow color, very much like carnotite, and contains 27 per cent. of uranium, together with some oxide of lead and other substances.

SYNTHETIC GEMS. The great difficulty in making artificial gems does not lie in reproducing their optical properties or their hardness and durability, but of bringing about a combin-

ation of both. This is conspicuously the case with the diamond, and yet early in the year announcement was made that large-sized crystals from carborundum had been produced which were very close to the natural stone. The crystals are said to be as colorless and transparent as the natural diamond and have greater lustre and refractive power. But they are so brittle that they cannot be cut and polished like natural diamonds.

Later came the discovery of a new method of making diamonds by Dr. Werner von Bolton, in Berlin. His process is based on the decomposition of illuminating gas by a mercury amalgam, whereby the carbon contained in the gas is crystallized into diamonds. As these diamonds are extremely minute, small bits of diamond dust are introduced into the apparatus, where they serve as mother crystals upon which larger diamonds are gradually built up.

Genuine coral has become so expensive that chemists began experimenting to produce it artificially. It is announced that a synthetic product has been obtained that is guaranteed to be not only of the identical color of the finest pink coral, but also to have the same weight, "feel," and temperature.

SYNTHETIC PRODUCTS. A process for the manufacture of ammonia is described as follows: The chemical inertia of nitrogen toward hydrogen, which has been an insurmountable obstacle to the synthetic production of ammonia, has been overcome by high pressure applied in the presence of catalytics. A mixture of the cheapest nitrogen and hydrogen gases in the proportion of 1 to 3, with uranium powder containing carbon added as a catalytic, was converted into ammonia gas under a pressure of 200 atmospheres and at a temperature of 500° C. Only about 8 per cent. of the gas mixture was converted, but by removing the ammonia gas, either by liquefaction or by means of a chemical absorbent, the transforming process may be made continuous. This is accomplished by connecting a high-pressure rotary pump and a liquefying apparatus with a refrigerating machine to the massive reaction vessels in which the gas transformation takes place.

Synthetic turpentine is on the market in Germany at about the price of American turpentine. In consequence of which the incentive to the manufacture of substitutes has increased considerably, and several companies are devoting themselves exclusively to the manufacture of the synthetic substitute.

The introduction of synthetic indigo has resulted in the decline of the indigo industry in India from 20,981,744 pounds, valued at \$17,848,370 in 1896, to 2,022,832 pounds, valued at \$1,172,718, in 1910. It is believed, however, that by scientific cultivation the natural indigo can be made to compete successfully with the synthetic product.

A German chemist, A. Eichengruen, is reported to have discovered an incombustible substitute for celluloid, which he calls "cellon." It is an acetylcellulose product and is reported to furnish a commercial substitute for celluloid which can be made into all sorts of objects. It can be colored in any way that celluloid can and also be made to imitate tortoise shell. When brought into contact with a flame, "cellon" melts, but does not take fire.

The principle of the manufacture of artificial lace or net rests on the substitution of contin-

uous molding for weaving. The process embraces the following steps: (1) The preparation of a concentrated cellulose paste; (2) the molding of the paste and its subsequent solidification; (3) finishing the net, which includes washing, dyeing, drying, and calendering. In the preparation of a suitable cellulose paste any plastic material may be used, provided it is sufficiently strong and is susceptible of giving a brilliant thread after solidifying and drying. In particular, all derivatives of cellulose used in the manufacture of artificial silk give good results when properly manipulated. A factory in France now making artificial net has manufactured crinoline and artificial silk with a cupro-ammonical solution of cellulose, and introduced, in order not to complicate its existing methods of manufacture, a process for the new net, likewise based on the use of a cupro-ammonical solution, which is successful; but the composition that the factory uses for the manufacture of this artificial net differs completely from those employed in the production of crinoline and of artificial silk. It has to meet certain technical requirements, such as increased tenacity in the cellulose and a maximum of viscosity and rapidity of solidification in the mold. These were the object of long study on the part of chemists, who have arrived at very satisfactory results, taking as a base cellulose, very cheap cotton waste, and linters.

An inexpensive process for the manufacture of artificial wood from straw or dried grass, which it is proposed to utilize for the manufacture of matches, has been shown in London. Straw is passed longitudinally through a pair of crushing rolls, and then between a pair of cylindrical cutters which divide the flattened straw into strips. The surfaces of the cutters are deeply serrated, and are placed together so that the groove of one cutter receives the raised ring of the other. The straw, supplied with an adhesive, is fed to a traveling band, and is inclosed on top and underneath with layers of paper. The layer of straw and paper is passed through a pair of rolls under pressure, and then between a pair of endless chains, one upper and one lower, the links of which form metal molds, and are constructed longitudinal grooves, the edges of which meet opposite one another. The molds are heated, and are pressed together for a sufficient time to enable the agglutinant to harden. After passing between the chains the straw and paper issue in the form of a layer of round splints, which after being cut into the requisite length for matches are dipped into ignitable composition.

An artificial sponge is now made by the action of zinc chloride on pure cellulose. This results in a pasty, viscous mass, which is mixed with coarsely grained rocksalt. Placed in a press mold armed with pins, the mass is pierced through until it appears traversed by a multitude of tiny canals, like the pores of a natural sponge. The excess of salts is subsequently removed by prolonged washing in a weak alcoholic solution. The artificial sponge swells up with water, but hardens on drying, just like its prototype; it is said to be eminently adapted for filtering water for sanitary or industrial uses.

ALCOHOL. The increasing demand for alcohol for industrial purposes has resulted in the exploiting of sources never before considered important. Experiments have been made in Spain to obtain alcohol from the bean or fruit of the

carob tree. After triturating the fruit it was placed in hot water to steep and the sugar or glucose extracted by means of a current of water. The liquid resulting from this process was then allowed to ferment, the glucose being transformed to alcohol, which was then distilled. It was found that 2.3 quarts of pure alcohol could be obtained from 22 pounds of the beans. Owing to the great quantity of carob trees in Spain, this discovery will likely establish an important industry there, as well as in other Mediterranean countries.

From Mexico comes the announcement that the residue from the maguey or social hemp will yield alcohol. In the process of extracting the fibre the "flesh" of the leaf is scraped off by machinery and this, with the exception of a small portion used in the manufacture of packing paper, has been thrown away. This waste, it is now found, together with the juice which escapes during extraction of the fibre will produce a good commercial alcohol. The raw material is placed in tanks with water and allowed to ferment for two days, after which it passes into a specially arranged still. Approximately, the waste of 1000 leaves gives 400 liters of juice, which in turn produces about 80 liters of alcohol of 40°, perfectly good for all uses.

As a result of investigation into the alcohol industry of the Philippines, attention is called to the probability that not only alcohol but sugar can be made from the nipa palm more economically in the Philippines than from sugar cane, and that the possibilities of sugar production from this palm constitute a matter of great importance to the islands. The chief use of the plant, aside from the use of the fibre for hats and various articles, is in the manufacture of alcohol and native drinks from the sap. The report of the Philippine Bureau of Science shows the cost of producing alcohol from the nipa palm as 2.7 cents a liter as compared with 5.8 cents a liter for alcohol from sugar beets at \$5 a ton; 5 cents for alcohol from sugar cane at \$3.25 a ton; 3.4 cents from cassava at \$5 a ton; 6.6 cents from corn at 70 cents a 56-lb. bushel, and similar costs from other sources. There is one distillery in the Philippines which is now producing 93 per cent. alcohol 186 proof at a cost of 5 cents gold a liter on a 12-hour run at the distillery. As for sugar, it is claimed that as the cost of refining will probably be less than that for cane, and since sugar is an expensive raw material for the manufacture of alcohol, more profit is to be made from the nipa lands through the establishment of sugar refineries than distilleries. A similar analysis of the sap and its possibilities from the buri, the sugar, and the coco palms has been made. The buri palm in particular has promising possibilities. This palm is not only used for many purposes, but it is also a producer of starch. The starch is contained in the fibrous interior of the plant. The plant is felled by the natives and is stripped of its bark and leaves. The stem is then chopped into small pieces and is worked in water to extract the starch from the fibre. The starch in suspension in the water gives the latter a milky appearance. It is separated from the water by straining through a cloth woven from a part of the manila hemp fibre and is then dried. The starch is light yellow or brown in color, according to purity. Wet globules dropped on a hot iron plate will turn into a sort of

soot. The starch analyzed shows about 72 per cent. pure starch.

The announcement that it is possible to make alcohol without fermentation is made by an English chemist. His original experiment showed that by slightly warming beer and then driving through it a brisk current of carbon dioxide gas the alcohol could be extracted in the form of minute bubbles. By continuing the process every trace of alcohol could be absolutely eliminated without destroying any of its former qualities as a beverage. By reversing the process he was able to restore the alcohol.

RUBBER. The interest in India rubber has not been so active since the collapse of the speculative "craze" that prevailed in financial centres last year. New uses for rubber continue to be reported and the search for a synthetic product continues. A new source of its production is reported by J. Dybowski, who announces that it is possible to extract commercially from a gum called jelutong 10 to 20 per cent. of rubber. This gum is derived from a plant found in large quantities in the Malay states and can be obtained at a low price in the principal European markets. The method of extracting the rubber is simple and easy, and takes only three or four hours. The preparation costs little, and the product can be sold at a price lower than obtains in the rubber market and yield a handsome profit.

PAPER.—George B. Frankforter announces a new process for making wood pulp from sawdust. It consists in taking small pieces of waste wood or sawdust, laying them on a steel incline over a furnace, and subjecting them to a process of distillation. Carbon disulphid or gasoline is poured over the sawdust, dissolving the turpentine and resin, which pass off as gases into a coil of pipes leading to a tank. The wood pulp remains, free from pitch and suitable for the manufacture of paper.

Bamboo pulp is said to be likely to become an important source of paper stock supply, especially in warmer countries. The difficulty of removing the coloring material has been successfully overcome, and in many respects no other material can compete with it.

LIGHTING. An incandescent light, burning kerosene, has been invented by Herschell M. Conner of Savannah, Ga. The kerosene is confined in a tank, not unlike the carbon dioxide tanks used in soda fountains. These tanks are put under pressure with a hand pump to twenty or twenty-five pounds, forcing the kerosene from the cellar through very fine lead tubing. When the kerosene reaches the burner in a fine stream or spray, it is immediately vaporized. This vapor, spread over a Welsbach burner, makes the light.

A Dutch inventor claims to have discovered the secret of extracting any desired percentage of nicotine from tobacco in the leaf, and caffeine from coffee, which removes the alleged cause of injurious effects. For notes on alcohol in relation to Industrial Chemistry, see **ALCOHOL**.

CHEMISTRY, BUREAU OF. See **FOOD AND NUTRITION**.

CHESS. The prominence attained by Jose R. Capablanca, the Cuban chess champion, was the noteworthy feature of the year 1911 in chess circles. This player to the surprise of the experts carried off the laurels at the international masters' tournament held at San Sebastian, Spain, by winning nine and one-half games

out of fourteen. In this tournament A. K. Rubenstein and M. Vidmar tied for second place, each having nine victories and five defeats. F. J. Marshall, the United States champion, finished fourth with eight and one-half wins out of fourteen games. The Carlsbad tournament was won by R. Teichmann. Other important matches abroad were those held at Berlin in which Lasker defeated Janowski by eight to nothing, at Cologne where Tarrasch and Schlechter each won three games and drew ten games, and at Hamburg where Marshall was a victor over Leonhardt.

The year 1911 marked the end of the Anglo-American cable matches for the international trophy offered by the late Sir George Newnes. Great Britain won the final match by a score of six to four. Thirteen matches in all were played since the series started, Great Britain and the United States each winning six contests with one a draw. The fact that the British players' victory of last year was their third in succession gained them possession of the trophy. Columbia won the 1911 intercollegiate championship, winning eight games and losing four. Yale finished second and Harvard third.

CHICAGO-PHILADELPHIA OPERA COMPANY. See MUSIC.

CHICAGO, UNIVERSITY OF. The total number of students enrolled in the various departments of the university in the year 1911-12 was 6466, an increase of 459 over the enrollment of the previous year. The faculty numbered 337. The amount of productive funds was \$15,945,516 and the income was \$1,644,377. The university during the year adopted a new set of requirements for entrance to the college, and a new curriculum for the bachelor's degree. The new requirements for entrance demand fifteen units, without conditions. A somewhat wider range of subjects is accepted for entrance than previously. Instead of demanding preparation in a list of specified subjects, the university now designates a certain amount of consecutive and concentrated work without attempt to specify the special subjects in which this shall be represented. Students are only permitted to enter on these terms from an approved school, i. e., a school offering a satisfactory four years' course which the university has inspected. The requirements for graduation also involve the principle of continuity and concentration, rather than the previous principles of specifically assigned courses. The amount of entirely free election under the new system closely resembles that under the old, i. e., for a judiciously selected course approximately one-third of the entire high school and college work, but the actual flexibility of the system is much greater than the old in permitting the student to choose in what fields he will specialize. Specialize he must, however, to a considerable extent before he gets through.

The new Harper Memorial library is practically completed. This is altogether the most commanding building upon the grounds, having been erected at a cost of some \$600,000. A large addition has also been made to the Ryerson Physical laboratory through the generosity of the original donor, Mr. Martin A. Ryerson. Extensive additions have been made to the faculty of the College of Education, and the work of this

division of the university is now in the most satisfactory condition which it has ever attained. The president is Harry Pratt Judson, A. M.

CHILD LABOR. LEGISLATION. According to the summary of child labor legislation prepared by the American Association of Labor Legislation there were more laws relating to child labor passed in 1911 by a greater number of States than in any preceding year. Of forty-one States holding legislative sessions in 1911 thirty enacted child labor laws, a total of fifty-nine such laws being passed. The following ten States reenacted their entire child labor code with distinct improvements: Colorado, Michigan, Missouri, New Hampshire, Tennessee, Texas, Utah, Vermont, West Virginia, and Wisconsin. In California, Indiana, Oregon, and South Carolina considerable advancement was made. Nine States extended the fourteen-year minimum age limit for new occupations; five States for the first time prohibited all work during the school term; a number of States strengthened their compulsory school attendance laws. Considerable legislation dealt with dangerous occupations, with night messenger service, and with street trading. The hours of labor for children were shortened in ten States, the eight-hour day for all children under sixteen being established in Colorado, Missouri, and Wisconsin. This makes ten States, besides the District of Columbia, which have an eight-hour day for all children under sixteen. Children under sixteen were excluded from all night work in six States, while California excluded all under eighteen after ten P. M. Night work is now prohibited in thirty-one States. Ten States passed improved laws for the certification of age or education or other requirements of the law. It was noticeable that the more advanced industrial States passed the greatest amount and the most thorough-going child labor legislation, whereas the Southern States as a rule have been slow to accept the progressive conditions. The new States of Arizona and New Mexico took an enlightened position on this subject, this being particularly true of the Arizona constitution.

EMPLOYMENT ON THE STAGE. One of the problems to which the child labor reformers have been giving attention in recent years is the employment of children on the stage. Several years ago the Massachusetts legislature forbade such employment. Since then the theatre managers have endeavored annually without success to secure the enactment of a law exempting stage children from the general child labor law. At the same time the National Child Labor committee has striven for similar anti-stage legislation in other States, securing prohibitory laws in Illinois, Louisiana, and Oregon. In Colorado stage children must secure permits from public school authorities; these may require that the child be accompanied by a teacher or nurse.

POVERTY. One of the chief sources of opposition to child labor reform is the feeling that widowed mothers will be reduced to poverty by such laws. To meet this objection scholarships have been provided in Chicago, Philadelphia, New York, Baltimore, Louisville, and elsewhere. These give a small sum weekly to the family of the widow when partially dependent on the earnings of a child prevented from working by advanced legislation. The States of Ohio, Oklahoma, and

Michigan have followed the Swiss plan of granting state aid. This seems logical, since it is the state which takes away the opportunity to labor. The Ohio law permits relief to be given through the school authorities in money or in the form of textbooks, clothing, and meals. The Oklahoma and Michigan laws require relief to be given in money. Such legislation is deemed much more necessary by reformers for the Southern States, because investigation shows many families wholly dependent on the earnings of small children. Moreover, these States very generally allow exemption from their already inadequate laws where poverty is shown, though Tennessee and North Carolina repealed this exemption in 1911.

DANGEROUS TRADES. Another line of advance is the exclusion from dangerous trades. This is a part of the general movement for conserving the labor power of the country, particularly in relation to industrial accidents and occupational diseases. It has been carried farther in Massachusetts than in any other State. Under the authority of an act of 1910 the Massachusetts State Board of Health has prepared a list of twenty-four different industrial processes from which minors under eighteen years of age are excluded. Ten of these involve exposure to poisonous dust or substances, mostly leads; six involve exposure to irritating dusts, as graphite used in the manufacture of stove polish, bronze in lithographing, emery in polishing, talc in rubber works, and the dusts of rags; four involve exposure to poisonous gases or fumes; three to irritating gases or fumes; and one to excessive heat. During 1911 nine States excluded children under sixteen from a more or less extensive list of occupations. This list included mines in Colorado, Pennsylvania, and Tennessee. Moreover, the age limit for employment in mines and quarries was put at seventeen in Texas and eighteen in Wisconsin.

STREET TRADING AND NIGHT-MESSENGER SERVICE, including boys and girls in cheap theatres and moving picture shows, sellers of newspapers, matches, and shoe blacking, and messenger boys, has been studied intensively in this country and in England. They are often dangerous to both health and morals. Another main objection is that these trades do not lead to stable occupations; they afford no valuable training for adult life and are generally debasing to morals. At the hearing on the Massachusetts night-messenger bill statistics were presented showing that, out of 336 boys at the Lyman School, 110 were former street peddlers; 160 had been newsboys; 72 boot-blacks; and 56, messengers; some were thus engaged in two of these trades. Similar data were secured from the Parental School. Night-messenger service was prohibited in 1910 for persons under twenty-one in New York and for those under eighteen in Ohio. Laws similar to the New York law were enacted in 1911 in Massachusetts, New Jersey, Wisconsin, and Utah; laws applying to persons under eighteen were enacted in Michigan, New Hampshire, Oregon, and Tennessee; Georgia forbade night messenger service to persons under sixteen and Oregon forbade day-messenger service to such. Street trading was restricted and regulated by new laws in Georgia, Nevada, New Hampshire, Massachusetts, Missouri, Utah, and Wisconsin. The Georgia law applied only to girls under ten. The Wisconsin law which is now considered the most perfect on this subject is as follows: The

age limit for selling newspapers is twelve for boys and eighteen for girls; for all other street trades the age limit for boys is fourteen and for girls eighteen years. Boys under fourteen cannot sell papers after 6:30 P. M. in winter nor after 7:30 P. M. in summer. Parents and employers are made responsible and punishable for violations.

In ENGLAND a special committee was appointed to investigate the working of the Employment of Children act of 1903, with reference to street trading. The committee was unanimous in holding that complete prohibition of such trading for minors was not desirable. But a minority did not feel that this could be done immediately. The majority of that committee and also the Royal commission on the poor laws recommended the prohibition of street trading for boys under seventeen and girls under eighteen. Statistics showed that some 40,000 children, sixty per cent. to seventy-five per cent. of whom were under fourteen years of age, were thus engaged in Great Britain. The *London Economist* upheld the recommendation on the ground of social economy and efficiency. It pointed out that these children "are being allowed to endanger their whole prospect of becoming decent citizens in order to earn a few pence." These committees favored the immediate formulation of plans for providing alternative work for all young persons. A bill was introduced in Parliament by Lord Shaftesbury; it raised the age limit of street trades from eleven to seventeen for boys and eighteen for girls.

GLASS INDUSTRY. The employment of boys at night in the glass industry has been a matter of concern among the reformers for some years. In a thorough investigation by Mr. Charles L. Chute, covering ninety-nine plants in Ohio, Indiana, Illinois, West Virginia, and Pennsylvania, he found that 6.3 per cent. of the 33,308 employees were children under sixteen, 1973 boys and 72 girls. The percentages ranged from 3.8 per cent. for Illinois and 4.7 per cent. for Ohio to 9 per cent. in West Virginia and 13 per cent. in Pennsylvania. Since Illinois and Ohio have better child labor laws than Pennsylvania and West Virginia, this difference is in part attributable to legislation, in spite of the numerous obvious violations in the former States. The investigator concluded that, as a result of the passage of child labor laws, the industries have not been crippled, that many children have been transferred from glass plants to schools, and that poverty has actually lessened.

SEASONAL TRADES. Some of the new investigations carried on under the direction of the National Child Labor committee dealt with cranberry-pickers in Massachusetts and oyster-shuckers and shrimp-pickers of the Gulf coast. In these seasonal trades the whole family, sometimes including children not more than three years old, work. Moreover, many of these families drift about from one seasonal occupation to another, perhaps spending the winter months at the Southern oyster and shrimp canneries and the early summer months in the berry fields of Maryland, Delaware, and New Jersey. Though not unhealthy for the children, they grow up in complete ignorance and with no training for steady industrial occupation. These seasonal trades carried on at a distance from industrial centres more or less readily escape the child laws.

OTHER LEGISLATION. In addition to the laws already noted the following brief summary covers most of the important legislation of 1911. California raised the age limit from fourteen to fifteen in most occupations; strengthened its certificate law; prohibited work for children under eighteen between 10 P. M. and 5 A. M., except for children between fifteen and eighteen on the stage; and forbade children under eighteen engaging in any business or selling goods between 10 P. M. and 5 A. M. Colorado placed the age limit at fourteen for all occupations during the school year; children under sixteen may not be employed in concert halls, variety theatres, or in any immoral or dangerous vocation, nor in or about mines, coke ovens, or in certain specified dangerous occupations; the hours for children under sixteen must not exceed eight per day nor forty-eight per week, nor can they be later than 8 P. M.; children under fourteen may not work before 7 A. M. Connecticut forbade the employment of children in certain dangerous trades; provided for an industrial commission to investigate the employment of women and children, to report April 1, 1913; and limited the power to issue certificates to the State Board of Education. Delaware authorized a commission to report to the next legislature (in 1913) on child labor conditions. Idaho prohibited the employment of children during school hours and between 9 P. M. and 6 A. M. Illinois strengthened its certificate law. Indiana prohibited employment under fourteen, except on farms or in domestic service, but children of ages twelve to fourteen may be employed in canning between June 1 and October 1; the hours for children under sixteen are limited to nine per day and fifty-four per week, but without the consent of parent or guardian the house cannot exceed eight per day or forty-eight per week; night work under sixteen is prohibited; children under sixteen, and in some trades girls under eighteen, may not be employed in a specified list of dangerous occupations. Maine repealed the law exempting canneries from the child labor law except as to hours. Massachusetts reduced the hours per week from fifty-six to fifty-four, except that in seasonal trades fifty-eight are allowed; certification conditions were raised; and the Board of Education was directed to investigate the advisability of part-time schooling, vocational or otherwise, for working children and the establishment of an apprenticeship system, and to report January, 1913. Michigan amended its certification law and excluded children from employment on the stage in shows, pool-rooms, and dance-halls. Missouri forbade the employment of children under fourteen, except in agriculture and domestic service; and extended the list of dangerous occupations from which children under sixteen are excluded by adding match-making, work with explosives, work in breweries, hotels and some other establishments; the hours of labor for children under sixteen were reduced to eight per day and forty-eight per week; night work was forbidden between 7 P. M. and 7 A. M.; the certification law was strengthened; boys under ten and girls under sixteen were forbidden to sell newspapers or merchandise in the streets or in public places. Nevada greatly extended its compulsory education law. New Hampshire barred children under twelve from manufacturing and mercantile establishments; the hours for boys under sixteen and girls under eighteen were limited to eleven per day and fifty-eight per

week; night work was forbidden to these same persons, except that girls over sixteen may work until 10 P. M. in retail stores and telephone exchanges; a school certificate law was improved; and provision made for the discharge of working children whose health is in danger. New Jersey prohibited children under fourteen in mercantile establishments during school hours; prohibited children under sixteen from working in such establishments more than fifty-eight hours a week or between 7 P. M. and 7 A. M., except that they may work until 9 P. M. one day a week and until 10 P. M. between December 15 and 25. New York added barber shops, shoe-polishing establishments, and theatres in which the employment of children under fourteen is prohibited and where children under sixteen may be employed not more than six days or fifty-four hours a week or nine hours a day and not after 7 P. M. or before 8 A. M. North Carolina reduced the hours of children in factories from sixty-six to sixty per week. Ohio established a commission to revise, consolidate, and suggest amendments to its child labor laws. Oregon forbade children under fourteen to work in mercantile establishments, business offices, restaurants, bakeries, hotels or apartment houses, or anywhere during the school term. It created a board of inspection of child labor with a paid secretary to enforce the child labor law. Pennsylvania greatly improved various laws regulating the employment of children in mines. South Carolina raised the age limit for children employed in mines and factories from twelve to sixteen years. Tennessee extended the scope of the fourteen year age limit; and prohibited the employment of children under sixteen in certain dangerous occupations. Texas prohibited the employment of children under fifteen about dangerous machinery; excluded them from employment in distilleries or breweries, or in employments dangerous to health or morals. Utah excluded children under fourteen from certain dangerous or injurious occupations, including theatres; forbade the employment of girls under twenty-one where liquors are made or sold; limited to fifty-four hours per week the work of boys under fourteen and girls under sixteen; prohibited boys under twelve and girls under sixteen from selling newspapers or merchandise in first and second class cities; required that bootblacks must be at least twelve years of age; and forbade persons under twenty-one being employed in saloons, breweries, or liquor bottling establishments. Vermont forbade the employment of children under twelve in mercantile establishments and under fourteen on railroads or in factories, quarries, or workshops; children under sixteen are excluded from certain dangerous occupations, and night work after 8 P. M. was prohibited for them. West Virginia placed the age limit for manufacturing establishments at fourteen and required a high standard employment certificate for all children under sixteen. Wisconsin greatly extended the list of dangerous occupations from which children under sixteen are debarred and excluded children under eighteen from a list of especially hazardous occupations; night work for those under sixteen was prohibited; a forty-eight-hour six-day week was established for children under sixteen and the certificate law was improved by adding requirements for documentary proof of age.

MODEL LAW. All child labor reformers are agreed that one of the greatest difficulties in se-

curing progressive legislation is the existence of competition between States. Thus, Illinois manufacturers fear a law limiting the employment of children to eight hours per day when Wisconsin and Indiana laws permit ten hours per day. Federal statutes are not as a rule considered feasible because of the limited jurisdiction of Congress. The United States Commission on Uniform Laws is endeavoring to overcome these difficulties by formulating and agitating the adoption of a model uniform law. This model prohibits the employment of children under fourteen years and regulates the employment of children above that age. It forbids night work and occupations considered dangerous to health or morals for children under sixteen. It requires that the child must secure a certificate from school and medical authorities showing educational and physical fitness. Very dangerous trades are not open to children under eighteen, and in some cases not even for those under twenty-one. Girls under twenty-one cannot be employed in coal mines or quarries, and no minor in saloons, bar rooms, or night messenger service. All street trades are regulated; and are forbidden to boys under ten and girls under sixteen. The hours of employment are limited to eight per day and forty-eight per week, between 7 A. M. and 7 P. M., for boys under sixteen and girls under eighteen. Every feature of this law is in force in some State. This law has been approved by the National Child Labor Committee and by the American Bar Association and is to be at once submitted to the legislatures.

CHILD LABOR CONFERENCE. The seventh annual Child Labor Conference under the auspices of the National Child Labor Committee was held at Birmingham, Ala., in April. The report showed much progress in the past seven years. The membership of the committee reached over five thousand and the annual expenses more than \$60,000. Besides the trained workers maintained by the committee, there were reported twenty-seven State and local committees. The work remaining to be done in the reforms advocated by this committee was suggested by the following conditions: Ten States still allowed children under fourteen to work in factories; eight still allowed boys of twelve to work in mines; fifteen allowed children under sixteen to work at night; only a few States have an eight-hour day for children; proof of age and factory inspection are very inadequate. The committee is giving attention also to industrial education and vocational guidance.

CHILD LABOR COMMITTEE, NATIONAL. See CHILD LABOR.

CHILD LABOR CONFERENCE. See CHILD LABOR.

CHILDREN, WAYWARD. See JUVENILE COURTS.

CHILDREN'S COURT. See JUVENILE COURTS.

CHILE. A republic south of Peru on the Pacific coast of South America. Capital, Santiago.

AREA AND POPULATION. Chile comprises 23 provinces and one territory, with an estimated area of 292,419 square miles (including Tacna province, 9248 square miles, claimed by Peru). The census of November 27, 1907, showed 3,249,279 inhabitants (Tacna, 28,748); the population in 1911 was probably about 3,400,000. Population of the larger cities (1907 census):

Santiago, 332,724; Valparaiso, 162,447; Concepción, 55,330; Iquique, 40,171; Talca, 38,040; Chillán, 34,269; Antofagasta, 32,496. Movement of the population:

	1907	1908	1909	1910
Births	126,104	129,733	129,261	129,999
Deaths	96,534	104,226	107,369	109,399
Marriages	21,286	21,483	19,543	19,352
Immigration	8,462	6,024	3,098	2,543

EDUCATION. Primary instruction is free, but not compulsory. At the end of 1910 there were 2716 public primary schools, with 4829 teachers and 258,875 pupils enrolled; private schools with state assistance had 36,577 pupils, and without state assistance, 30,385. The seventy-four lycæums had 18,669 students, and the two universities 2490; 15 normal schools, 2222; and various manual training and commercial schools, 2296. In addition there were several technical schools. The state religion is Roman Catholicism, but religious toleration prevails.

AGRICULTURE. Wheat and other cereals are the most important crops, but large quantities of fruits, vegetables, and wine are produced. The reported area under cultivation in 1909 was 9,211,324 acres; estimated value of agriculture products in 1910, \$75,000,000. Pastoral interests are developing, notably in the south; in 1910 some 21,600,000 pounds of wool were shipped from Punta Arenas, which has rapidly become a prominent port. Reported annual slaughter: Cattle, 450,000; sheep 600,000; swine, 140,000.

MINING. Chile owes its national prosperity largely to its mineral resources. Coal is mined, though not in sufficient quantity for home consumption, and copper, for which the country was once famous, shows a tendency to regain its former importance. The value of gold and silver produced is comparatively small. But the leading mineral, and by far the country's greatest single source of wealth, is sodium nitrate, produced in the arid north, in Antofagasta and Tarapacá, and widely used as a fertilizer. The value of the mining products is fairly represented by the export figures in the section on *Commerce*.

MANUFACTURES. These include household supplies, shoes and other leather goods, furniture, textiles and clothing, alcoholic beverages, metal wares, etc. There are large works for the reduction of nitrate. For 1910 there were reported 5321 industrial establishments operating with more than four employees each, with total employees 75,816, capital \$83,756,268, and production, \$112,769,387.

COMMERCE. Imports and exports have been valued as follows: 1908, 267,264,169 pesos gold and 319,149,072 pesos gold respectively; in 1909, 262,082,763 and 306,429,909; 1910, 297,485,697 and 328,827,176. Values in thousands of dollars (converted from pesos at 36.5 cents to the peso) have been:

	1901	1907	1908	1909	1910
Imports	50,485	107,194	97,551	95,660	108,582
Exports	62,723	102,229	116,489	111,847	120,022

Imports by major groups in thousands of dollars:

	1908	1909	1910
Imports			
Textiles	20,377	23,102	29,118
Mineral products	17,119	16,824	18,825
Coal, oils, etc.	17,100	16,571	18,778
Vegetable products	8,633	10,509	11,854

Imports (cont.)	1908	1909	1910
Machinery, hardware, etc.	19,438	10,309	9,513
Animal products	6,786	10,065	9,142
Paper and mfrs.	2,906	2,536	3,361
Liquors	1,851	1,931	2,584
Chemical products, etc.	1,983	2,020	2,336
Arms, explosives, etc.	635	829	1,598
Miscellaneous	823	843	1,473
Total	97,551	95,660	108,582

Cotton textiles were valued at \$14,441,030 in 1910: woolen, \$7,046,033; iron and steel, \$12,242,739; coal and other mineral fuels, \$17,070,898; live animals, \$5,503,842.

Exports by major groups, in thousands of dollars:

Exports	1908	1909	1910
Mineral products	99,083	89,101	98,234
Animal products	6,092	8,438	8,824
Vegetable products	8,937	11,023	8,075

Vessels entered (1909), 14,587 of 24,923,308 tons; cleared, 14,402 of 24,696,585.

COMMUNICATIONS. Railways in operation at end of 1910: Government owned, 2672 kilometers (1660 miles); privately owned, 3078 kilometers (1913 miles); total, 5750 kilometers (3573 miles). Of the government longitudinal railway, to connect Arica with Puerto Montt, distant 3431 kilometers (2132 miles), about 1770 kilometers (1100 miles) were in operation, 1368 kilometers (850 miles) under construction, and the remainder under survey. The important Arica-La Paz line, which extends into Bolivia, was virtually completed at the close of 1911. Telegraph lines (1910), 22,334 miles (of which 16,513 miles government, with 367 offices); post offices, about 1100.

FINANCE. The monetary standard is gold, and the unit of value the peso, worth 36.5 cents. The current value of the paper peso was about 21 cents in 1909 and slightly under 22 cents in 1910.

Ordinary revenue in 1910 amounted to 82,764,423 pesos gold and 152,975,645 pesos paper; during the year the treasury sold gold to the amount of 23,238,519 pesos, which sum produced 39,333,216 pesos paper (the gold premium being about 69.2); the revenue, hence, is stated at 59,525,904 pesos gold and 192,308,861 paper. The expenditure is stated at 60,677,704 pesos gold and 234,143,253 paper. With the gold peso valued at 36.5 cents and the gold premium estimated at 65 (the figures used in the Chilean reports), the revenue and expenditure for 1910 are equivalent to \$64,049,081 and \$73,942,688 respectively. The chief sources of revenue were: Nitrate export duties, 79,665,417 pesos gold; state railways, 47,760,751 paper; import duties, 44,436,032 paper; surtax on imports, 29,608,792 paper. Estimates of expenditures for 1911, published in March of that year, were 241,744,448 pesos paper (\$48,348,888 United States currency), and 63,124,573 pesos gold (\$23,040,469 United States currency). Foreign debt (December 31, 1910), £25,258,620 (336,781,600 pesos gold, or \$122,921,074); internal debt, 6,093,800 pesos gold and 179,465,191 paper (with the gold premium at 65, \$39,699,876); total debt, \$162,620,950.

NAVY. As reported for 1911, the navy included: Two battleships, aggregating 15,600 tons; one armored cruiser, 7000; four protected cruisers, 14,500; two torpedo cruisers, 1470; seven torpedo-boat destroyers, 2270; five first-class torpedo boats, 728; and several auxiliary vessels and transports. The development of the Argentine and Brazilian navies has forced the Chilean government to adopt a plan of naval construction. In 1911 a contract was made for an English-built battleship of 28,600 tons and a battery of ten 14-inch guns, and a similar vessel was authorized. Also in 1911 six destroyers were ordered in England and two submarines in the United States.

ARMY. An active army with a strength of 18,000 men is maintained, capable of being increased on a war basis to 150,000 men by including a part of the national guard and other forces. Most of these are inadequately trained but are available for raising the war strength up to 350,000. The organization in 1911 included ten regiments of infantry, eight regiments of cavalry, twenty batteries of field artillery, one mountain battery, two battalions of mounted infantry, and a corps of engineers. During the year Chile ordered 200 field guns of the standard Krupp pattern, 14.3 pounders. These were similar to the Italian guns and fired both shrapnel and universal shell.

GOVERNMENT. The executive authority is vested in a president, elected indirectly for five years and assisted by a council of state and a responsible ministry. The legislative power devolves upon a congress of two houses, the Senate (37 members) and the Chamber of Deputies (108). The president for the term beginning September 18, 1906, was Pedro Montt, who died August 16, 1910, and was succeeded by the vice-president, Elías Fernández Albano. Señor Albano died September 6, and the minister of justice, Emiliano Figueroa, assumed the executive duties. A new president was elected on November 15 in the person of Ramón Barros Luco, who was inaugurated December 23, 1910. A new cabinet was announced in August as follows: Premier and minister of the Interior, J. R. Gutiérrez; Foreign Affairs, E. Rodríguez; Jus-

tice, B. Montt; Finance, P. N. Montenegro; War and Marine, A. Huneeas; Public Works, E. Zanartu.

HISTORY. On July 10 King George rendered his award in the Alsop claim. It assigned £187,000 to the Alsop firm in full settlement, and Chile paid this amount through the United States government on November 13. The original amount of the claim was £600,000, with interest. The award was received with satisfaction in the United States, through whose government Chile paid. The claim arose over forty years ago from a debt incurred by a Brazilian to the firm of Alsop & Co., of Valparaíso, a chartered Chilean concern, but with American members. In settlement of the debt the Brazilian made over to the firm certain claims from Bolivia lying in territory which was afterwards, as a result of the war of 1879, ceded to Chile. In 1909 Secretary Knox demanded the reference of the claim to The Hague, but to this Chile objected unless her government were allowed to use the argument that Alsop & Co. had been expressly excluded from the rights of American nationals by the Chilean-American Claims Tribunal in 1900, the American government having insisted on this exclusion. Finally, Secretary Knox issued an ultimatum demanding the reference to The Hague or payment of a million dollars to the United States. Later, however, an alternative was offered, namely, the reference of the claim to King Edward as arbitrator and finally Chile was induced to accept this. In June the long-standing dispute with Peru caused an outbreak, the immediate occasion being the question of holding mass in the churches of the disputed territory, but no serious consequences followed. In September a severe earthquake caused much loss of life and damage to property in the northern provinces. Early in November a severe epidemic of smallpox at Santiago caused much alarm. The authorities declared that the city was infected and warned the public against traveling on street cars and in hired carriages.

CHILTON, ROBERT S. An American public official, died May 18, 1911. He was born in Westfield, N. J., in 1822. In 1848 he removed to Washington and entered the patent office as librarian. He was transferred to the State Department in 1862. He served as private secretary to Secretary Seward and had much to do with the handling of the Confederate documents which were surrendered to the federal government at the close of the Civil War. In 1866 he was appointed commissioner of immigration. He entered the consular service in 1871 as American representatives at Clifton, Canada. He served in this capacity at several other cities in Canada until he resigned from the consular service some ten year previous to his death.

CHILTON, WILLIAM EDWARD. United States Senator (Democrat) from West Virginia. He was born in Kanawha in 1858. He studied law and was admitted to the bar, practicing his profession in Charleston. In 1883 he was appointed prosecuting attorney of Kanawha county. During the campaign of 1892 he was chairman of the Democratic State Executive committee and was appointed Secretary of State to serve from March 4, 1893, to 1897. He was elected to the United States Senate February 1, 1911, to succeed Senator Scott. His term of office expires in 1917.

CHINESE EMPIRE. A monarchy of eastern and central Asia. Capital, Peking. At the close of 1911 the country was in civil war.

AREA AND POPULATION. The estimated area of the empire is 4,274,170 square miles. Estimates of population vary widely, and the results of so-called Chinese censuses, based on estimates and on the enumeration of households, rather than of persons, are mere approximates. Such censuses of China proper (the eighteen provinces—1,532,420 square miles) have shown the following totals: For the year 1761, 190,257,000; 1812, 360,440,000; 1842, 413,021,000; 1882, 381,309,000; 1885, 377,636,000; 1910, 309,670,000 (exclusive of military). This last figure, based on the census taken in 1909 and 1910, is subject to revision, and contains only partial returns for Szechuen; the figure used for this province is 16,406,000, whereas complete returns will probably show some 49,000,000, thus bringing the 1910 "census" figure up to about 342,000,000. Some authorities regard this total as much too great, and incline to the 1904 estimate of Mr. Rockhill, the American minister at Peking, viz., 270,000,000. The great difficulty is in ascertaining the average number of persons in a household, the unit of enumeration. In the 1910 census for China proper, the number 5.5 is used, while Mr. Rockhill believes that 4 more nearly approximates the facts. The Chinese estimate of 1902 and subsequent estimates of the Imperial Maritime Customs are undoubtedly so excessive as to be of little value; the customs 1900 estimate is 439,214,000. The following table shows the estimated area of the several parts of the empire, the Chinese estimate of population for 1902, and figures based on the 1910 census. The figures in the 1910 column for Mongolia and Tibet are not derived from census returns, but are accepted by many as more nearly accurate than those of the 1902 estimate.

Empire	Sq. ml.	Pop. '02	Pop. '10
China proper	1,532,420	407,253,030	342,000,000
Manchuria	363,610	16,000,000	14,917,000
Mongolia	1,367,600	2,600,000	1,850,000
Tibet	463,200	6,500,000	2,250,000
Sinkiang	550,340	1,200,000	2,491,000
Total	4,274,170	433,553,030	*365,200,000*

* Including 1,700,000 military not tabulated elsewhere.

Population of China proper, by provinces, according to the census of 1885 and the census of 1910 (subject to revision) in millions:

Provinces	1885	1910	Provinces	1885	1910
Chekliang	11.7	17.1	Kwangtung	29.7	27.7
Fukien	23.5	13.1	Kweichow	7.7	11.3
Honan	22.1	25.6	Nganhul	20.6	17.3
Hunan	21.0	23.6	Pechili	17.9	26.9
Hupe	33.6	24.9	Shansi	10.8	10.0
Kansu	5.4	5.0	Shantung	36.5	29.6
Kiangsi	24.5	14.5	Shensi	8.3	8.3
Kiangsu	21.3	17.3	Szechuen	71.1	16.4*
Kwangsi	5.1	6.5	Yunnan	11.7	8.5

* Partial returns.

The 1910 figures in the foregoing table are stated to be exclusive of persons connected with the military to the number of 1,700,000 and of Peking, its suburbs, and a surrounding territory known as the metropolitan district; the population of the district, suburbs, and city is re-

ported at 5,671,000, of which city and suburbs 1,017,000, and city proper about 700,000. Estimates (not census returns) for the larger treaty ports are (1910): Canton, 900,000; Hankau, 820,000; Tientsin, 800,000; Shanghai, 651,000; Foochow, 624,000; Chungking, 598,000; Soochow, 500,000; Ningpo, 400,000; Hangchow, 350,000; Nanking, 267,000; Changsha, 230,000; Chinkiang, 184,000; Antung, 143,000; Wuhu, 129,000; Amoy, 114,000; Wenchow, 100,000; Swatow, 96,000; Chefoo, 95,000. In 1910 the reported number of foreigners living in the treaty ports was 141,868, of whom 65,343 were Japanese, 49,395 Russian, 10,140 British, 4106 German, 3377 Portuguese, and 3176 American.

The three recognized religions are Confucianism (the state religion), Buddhism, and Taoism. Native adherents of religions properly foreign to China include Mohammedans, estimated at 30,000,000 (probably the estimate is too high), Roman Catholics 1,000,000, and Protestants 150,000.

EDUCATION. There are three classes of schools—the old-style schools, the mission schools, and the institutions established by the government pursuant to the imperial decree of September 3, 1905. The old-style schools are private institutions, whose curriculum is practically confined to the Chinese classics, examination in which, for state employment, was abolished by the above-mentioned decree. This decree provided for an elaborate system of education, modeled on that of Japan. It was recognized that considerable time must elapse before the new system, differing radically from the old in aim and method, could be satisfactorily developed, but in 1911 the general condition of the educational movement was regarded as encouraging, particularly in and about Peking. It is to be noted that military schools have recently sprung up in many parts of China. Besides the Imperial University at Peking and the finely equipped Imperial University at Tientsin, both of which have European, Japanese, and Chinese professors, there are various schools or colleges for higher and technical education.

In place of the competitive examinations for securing the best candidates to be sent to the United States for study, a special school was established in 1910 near the summer palace, outside Peking, and American teachers were engaged to fit students for admission to American colleges.

According to official reports submitted by the ministry of education to the throne in 1908 and at the close of 1910, the students in the provincial schools numbered 1,013,571 in the former year and 1,284,965 in the latter, an increase of 274,518, including an increase of 3951 in the number of special students, and 4923 in the number of students in industrial schools. In Peking the number of students increased from 11,417 (1908) to 15,774 (1910), and the number of schools from 206 to 252. The reports also showed that while in 1908 the government schools, that is those supported by officials, exceeded in number those maintained by public and private contributions, in 1910 the public and private schools were the more numerous.

INDUSTRIES. China proper is a distinctively agricultural country and for the most part is divided into small holdings. In the north, the principal crops are wheat, barley, corn, millet, and other cereals, and beans and peas; in the south, rice, cotton, sugar, and indigo. Tea and

silk cocoons are very important products, the former in the west and south, the latter in every province. About 27 per cent. of the world's supply of raw silk comes from China. Large amounts of opium have been produced, but the output, pursuant to government decree, and the importation from India, through the coöperation of the Indian government, are being gradually contracted.

China is rich in minerals and is one of the first coal countries in the world, but, in general, exploitation has not attained a great development. The minerals worked to a greater or less degree include coal, tin, iron, antimony, lead, zinc, copper, and salt. Of the metals, tin (in Yunnan) and iron are the most important.

COMMERCE. Though the foreign trade of 1909 was the greatest recorded up to that time, it was exceeded by the trade of 1910. Imports for consumption and exports of domestic produce have been valued as follows in haikwan taels (the haikwan, or Maritime Customs, tael, is 1½ ounces avoirdupois, or 583.3 grains, or 37.783 grammes, and had a value of about 79 cents in 1907, 65.5 cents in 1908, 63.4 cents in 1909, while the average for 1910 was 66 cents).

	1907	1908	1909	1910
Imp.	416,401,369	394,505,478	418,153,067	462,964,894
Exp.	264,380,697	276,660,403	338,992,814	380,833,328

* Including cotton yarn, valued in 1909 at 71,154,000 hk. tls., and in 1910 at 65,304,000 hk. tls.

The increase in the value of the opium import in 1910 was entirely due to rise of prices, as the net import by weight fell from 48,817 piculs in 1909 to 35,358 in 1910. Leading exports in thousands of haikwan taels:

In 1909: Steam, 87,802 vessels of 80,613,800

tons, and sail, 120,714 of 6,157,919 tons; in 1910: Steam, 96,196 vessels of 82,337,331 tons, and sail, 123,614 vessels of 6,439,358 tons.

COMMUNICATIONS. Roads in China are numerous, but generally in poor condition. More important commercially are the rivers and canals. The length of railway open to traffic in June, 1911, is reported at 5342 miles. Some of the lines are owned by the government, some by private companies. In the early summer of 1911, an imperial decree was issued announcing the government's determination to nationalize all privately owned main lines in the empire. The government stated that railway nationalization was necessary for the proper defense of the country; whatever this may or may not have meant, it was clear that the government desired to lessen foreign interests and influence in China. Moreover, there had come to light the fact of gross mismanagement and speculation on the part of officers and directors of some of the companies. Railway constructed was far disproportionate to the many millions invested in shares by the public and so, when the government proceeded to take over the lines at their actual physical value, a large and immediate loss to the stockholders in some companies was apparent. Disapproval of the government's policy, on the part of the people as well as of the affected companies, was quickly manifest, especially in Szechuen and Hunan, and culminated in the September insurrectionary outbreak in Szechuen. The so-called Hukwang foreign loan of £6,000,000 (which is included in the total sterling debt given in the section Finance) was contracted in May, 1911, for railway construction, particularly on the Szechuen-Hankow and Canton-Hankow lines.

In 1911 railways in operation included the following: (1) Chinese Eastern Railway (Russian control), in Manchuria, from Kuanchengtzu north to Harbin and thence east and west to Russian frontier, 1080 miles (the Tsitsikar light railway of 17 miles connects with this line). (2) South Manchurian Railway (Japanese control), from Kuanchengtzu, south to Dairen (Dalny), 439 miles; branches: Mukden to Antung, 189; Choushuitzu (near Dairen) to Riojun (Port Arthur), 39; Tashihkiao to Yingkou (Newchwang), 13; Yentai to Taikang, 10; Suchiatun to Fushun, 34. (3) Imperial Railways of North China, from Mukden to Shanhaikuan (on the frontier between Manchuria and China proper) and thence to Peking, 522; branch: Koupangtze to Yingkou, 57 (of the main line about 275 miles and all of the other foregoing lines are in Manchuria); other branches: Peking to Tungchow, 12; Peking to Lukoukiao, 4. (4) Peking-Kalgan Railway, 135 miles; branch: Peking to Mentokow, 16. (5) Peking-Hankow Railway, 755; branches: Liang Siang to Tuli, 12; Koapetien to Siling, 36; Liuliho to Chowkweichwang, 10; Kaoyihshien to Liucheng, 11. (6) Shansi Railway, Shihkiaochwang to Taiyuanfu, 151. (7) Kaifengfu to Honanfu, 140. (8) Taokow-Tsinghwanchen Railway, 96. (9) Shantung Railway, Tsingtai to Tsinan, 256. (10) Canton to Samshui, 32. (11) Chuchow to Pinghsiang, 65. (12) Shanghai-Nanking Railway, 193; branches: Shanghai to Wusung, 10; Nanking City Railway, 8; (13) Swatow-Chaochow Railway, 24. (14) Loaki to Yinnanfu, 291 (the continuation of the French Indo-Chinese line from Hanof). (15) Canton to Kowlun (in the British ceded territory op-

posite Hongkong), 111; this line was opened October 4, 1911.

The following lines were under construction in 1911: (1) Canton to Hankow, 650 miles; about 60 miles open from Canton. (2) Szechuen-Hankow Railway, Chengtu to Hankow, about 800 miles; work begun at Ichang in December, 1909. (3) Tientsin to Pukow, 675 miles; about 290 miles of northern and 110 of southern section completed. (4) Kiangsi Railway, Kiukiang to Nanchang, 82; about 20 miles open from Kinkiang. (5) Shanghai-Hangchow-Ningpo Railway, 218; open to Hangchow, 118. (6) Nganhui Railway, Wulu to Kuangte-chow, 150. (7) Fukien Railway, Changchow to Amoy, 33; 10 miles completed. (8) Sunning Railway, Kongyik to Samkaphoi, 55; 40 miles south from Kongyik open.

Disturbed political conditions in China naturally interfered with the railway developments in progress in that empire. The Peking-Kalgan line was being extended and the missing links of the Peking-Shanghai connection formed by the Tsinan and Tehchow, and the Yenchowfu and Soochow, were under construction. The line from Peking to Canton had been completed as far as Hankow, and small portions of the remainder were in course of construction, namely, from Wuchang, opposite Hankow on the Yangtsé Kiang to the south; from Changsha to the south, an isolated section, and from Pachiang north to Shiuchow. A small amount of work was done on the great projected line from Hankow west to Chengtu, this being in the neighborhood of Ichang. Work was also done on the Changchun-Kiri line near Amoy; and on the section from Kiukiang to Nanchang of the line it was planned to extend from the former city to the ports of Swatow and Canton.

Progress was being made on the conversion of the South Manchurian Railway from 3 feet 6 inches gauge to 4 feet 8½ inches standard gauge, and the improvement of the line by reconstructing many of the gradients and curves. This line extends between Antung and Mukden, and work has been completed on the two end sections.

Telegraphs (1909): miles of line, 26,413; of wire, 43,011; offices, 528. Post offices (1910), 5357. The postal service has been much developed in the last few years; it was formerly a branch of the customs, but in 1911 was transferred to the ministry of communications and a postmaster-general was appointed.

FINANCE. No comprehensive statements of revenue and expenditure are officially published, but it is clear that in recent years the imperial government has been financially hard pressed. Except the imperial maritime customs, most of the revenue has been collected by provincial agents, and probably a considerable part of it has remained with the collectors. A 1901 estimate placed the revenue and expenditure at 88,200,000 and 101,120,000 hk. tls., respectively. (For the value of the haikwan tael, see first paragraph of section *Commerce*, above). A 1908 estimate placed the revenue at 105,000,000 hk. tls. The budget for 1911 showed an estimated revenue of 297,000,000 and an estimated expenditure of 351,000,000 hk. tls. Receipts from customs: 1907, 33,861,346 hk. tls.; 1908, 32,901,895; 1909, 35,939,917; 1910, 35,571,879 (of which 28,609,277 from foreign and 6,872,602 from internal commerce). The 1910 customs comprehended import duties, 14,087,232 hk. tls.; export duties, 13,128,635; coasting trade

duties, 2,123,798; tonnage, 1,329,024; transit, 2,064,167; opium likin, 2,839,023. The debt, as reported for January 1, 1911, is as follows: £59,892,174 (\$291,465,265); 377,783,388 francs (\$72,912,199); 12,470,000 yen (\$6,200,006); \$2,220,000; 3,270,000 Shanghai taels (\$1,975,080); 421,499,998 hk. tls. (\$283,669,498); total: \$658,442,043. (The Shanghai tael is converted at 60.4 cents, and the haikwan tael at 67.3, their value January 1, 1911.)

NAVY. Since 1909 plans for naval reform have been developing, but up to the end of 1911 no definite reorganization of the navy had been made. The fleet in 1911 was reported to include four cruisers (built in 1897 and 1898), 1 of 4300 tons and 3 of about 3000 tons each; various miscellaneous vessels of little fighting value, including 8 old cruisers; several old torpedo boats, dispatch boats, etc.; 5 modern torpedo boats; 4 torpedo boats for river service; and some 23 modern river gunboats. Two small Chinese cruisers of 2400 tons each, designed for use as training ships, were launched in England in 1911, the *Ying Swei* on July 14 and the *Chao Ho* on October 23.

ARMY. Under the disturbing conditions existing in China in 1911, it is somewhat difficult to distinguish between the conditions realized and the schemes proposed for the reorganization of the Chinese army, which was in progress at the beginning of the year 1911 under the law of military reorganization promulgated in January, 1905. There were, moreover, various changes in the war ministry, which in 1911 was remodeled and nine bureaus were constituted. The general plan provided for a national Chinese army instead of the more or less unorganized and separated forces of the separate provincial viceroys. The plan in force contemplated an active army with a first and second reserve of the Liou-kium or imperial land forces. This active army was organized on a basis of divisions in which the armies of the service were included and the plan was to divide the empire into five large military districts. With the 37 divisions contemplated in the scheme of organization, which was intended to be finished by 1913, 28,000 officers and 430,000 men, of which 380,000 were combatants, would be enrolled. Up to 1911 many of these divisions were merely skeleton organizations, and others had not been organized, but normally each would consist of about 12,000 men and comprise two brigades of infantry, each of two or three battalions to a regiment, a regiment of cavalry, a regiment of artillery, battalions of engineers and service troops in addition to the machine gun and aeronautical sections. It was provided to maintain the cavalry and the special troops on a war basis, but the infantry was to be maintained at half-strength and increased from the first reserve in time of war. The military spirit of the Chinese was being aroused, and the reserve service had become quite popular. It was thought that the five Yangtsé provinces would each contribute 10,000 fighting men to the new organization. In the early part of the year there were manoeuvres and General Na-tsing, with a staff of twenty-four officers, carried on an inspection of the regular forces in Manchuria, which comprised 35,000 men with 14 guns and 42 militia guns. While much of the military material is German, Japanese officers are taking a leading part in the training of the army.

The regular army, Liou-kium, was in process of active development during the year 1911.

Under normal conditions at the end of the year 1912, there should have been organized thirty-six divisions and one division of the guard. The force at the beginning of 1911 comprised thirteen divisions, whose organization was nearly completed, and 19 mixed brigades, or a total of 260 battalions of infantry, 58 squadrons of cavalry, 171 batteries, 72 companies of engineers, 66 train companies and 169 machine gun companies. The theoretical effective of these different organizations would be about 220,000 men. The real strength should be near 175,000 men. In 1911 the force was increased over previous years by about 32,000 men. This increase was principally on the frontier districts as follows: Manchuria (23rd division formed at Kirin, a mixed brigade), Yunnan (the completed 19th division), Turkestan (35th mixed brigade), Koang-tong (reorganization of the mixed brigade). These new companies were created by direct recruiting, by changes from the Siun-fang-toei, and by the incorporation of the best element from the old disbanded troops.

Antedating the more serious disturbances referred to below under *History* were mutinies at Koang-tong in the spring of the year, recalling those of February, 1910, in the same province, while other mutinies occurred at Koang-si and elsewhere. It was apparent at the beginning of the year that the army was largely under revolutionary influences.

Of the troops organized on the old basis, the former police, Siun-fang-toei, still existed in the majority of the provinces in variable numbers, in some places furnishing elements of the Liou-kiun, while in others it had been augmented by the best soldiers of the disbanded Louyings or remains of the old army of the Green Banner. Accordingly, the effective total of the Siun-fang-toei was about 200,000 men. This division of the Chinese army, in addition to playing the part of police, was designed to serve as supply troops awaiting the organization of the reserve. The Lou-yings were disappearing gradually, by disbandment, or absorption in the companies of the Siun-fang-toei or the Liou-kiun. The Pa-ki, the remaining contingents of the Manchurian banner troops, were either disbanded, or given modern training in the expectation of being included in the Liou-kiun.

The modern police (Siun-king-kiun) had been organized in the provinces. Well recruited and adequately drilled, it was considered that they were capable of rendering good service in the localities where they were organized. This force was under the control of the minister of the interior, and had an effective strength of about 158,000, or an increase of 68,000 over 1910. The organization is centralized in each province. In addition there was a new police of about 3000.

The organization of the Chinese military reserve as called for in the military scheme at the beginning of the year was more on a theoretical than a practical basis, and in only a few provinces had the matter been undertaken seriously. The reorganization of the various ordnance factories and arsenals was being undertaken, as this part of the army organization was in its infancy and China was forced to depend on outside assistance for military supplies of every kind. In fact, it was doubted by many authorities at the beginning of the year whether any large amount of munitions of war was available. The complete railway system as regards military organization and use was in an

embryonic state. The Chinese government, by decrees of May 9 and 22, 1911, had decided on the nationalization of all lines of railways existing or under formation, and the discontent arising from this measure was the principal cause of the trouble in Szechuen in September. (See above, *Communications*). The Chinese government in its military as well, as other operations had in view the substitution of central power for provincial responsibility, which had given only bad or indifferent results. The new war administration, under the control of the minister of war, Yin-Tchang, had actively forced this measure in order to achieve a complete system able to cooperate effectively in national defense, and its outcome after the revolution was a most interesting problem.

GOVERNMENT. A review of the recent movement toward constitutional government and of the revolutionary changes in 1911 will be found below under *History*.

The cabinet of Yuan Shih-Kai, who became prime minister in November, included the following members: Liang Tun Yen, foreign affairs; Yen Su, finance; Admiral Sah Chen Ping, war and marine; Chang Chien, agriculture, public works, and commerce; Hsen Chia Pen, justice; Tang Ching Chung, education; Yang Shi Chi, communications.

The rule of the Manchu dynasty in China dates from 1644, and the emperor Pu-yi was the tenth of the line. The emperor Tsai-t'ien (reign title, Kuang-hsü) died August 14, 1908. He was succeeded on November 14 following by his brother's son Pu-yi (reign title Hsin-t'ung), who was born February 11, 1906. The emperor's father, Prince Chun, was regent.

HISTORY

INTRODUCTION. For five years the constitutional movement which culminated in the revolution of 1911 had made steady progress. In 1905 commissioners were appointed to visit Germany, Great Britain, and Japan and study their constitutional systems and in 1906 a committee was appointed to consider their report. On September 20, 1907, an imperial decree was issued outlining a plan for a national assembly. On July 22, 1908, another decree provided for provincial assemblies to serve as a basis for a future parliament, and on August 27, 1908, the imperial government definitely outlined a constitution and promised to introduce a parliamentary system within nine years. Two important steps toward constitutional government were taken in 1910 in the organization of the new provincial assemblies or councils and of the new Provisional National Assembly or Senate, which was to form the nucleus of the House of Parliament. The provincial councils were consultative bodies, whose members were elected by voters having a property qualification or diplomas. Of these twenty-two councils only four drew much public attention to their activities in 1910, namely, those of Pechili, in which Peking is situated, Che-kiang and the two Hu provinces. The Pechili council was the most outspoken in its statement of grievances and the most discussed in the press. It was especially vigorous in supporting the demands for a national parliament. The other councils looked to it for guidance and followed its lead. They too joined in the general demand for a national parliament and sent delegates to Peking to press the matter. The Hupeh council was especially active in

opposing the government policy of foreign loans for railroads and it became involved in a quarrel with its viceroy. Thus it appeared that despite the limited powers of the provincial councils, they were far from showing the docility that had been expected of them, but had in fact constituted themselves organs of public opinion. The National Assembly or Senate was called together on October 3, 1910. It consisted of 195 members, of whom about one-half belonged to the privileged classes, princes of the imperial house, members of the nobility and representatives of the wealthy classes, all of whom were named by the sovereign, and the remaining half were delegates from the provincial councils. The new body soon showed itself responsive to the popular demand for the early establishment of a national parliament and like the provincial bodies it disappointed the hope of the government that it would be loyal and docile. In spite of its restricted powers, the right of free speech gave the more progressive senators an opportunity to urge reforms. They persuaded the Senate that the only way in which China could emerge from her difficulties and present a strong front against the foreigner was through a government based upon the popular will. They urged the hastening of constitutional government. The majority accepted these ideas, but it was soon seen that the Senate's deliberations had no result. It therefore began to work for the establishment of a cabinet of responsible ministers. This the court refused, but the Senate continued to insist down to the close of the session of January, 1911.

Meanwhile the constitutional movement throughout the country had steadily gained force. A petition for the introduction of constitutional government was presented in January, 1910, but failed. Thereupon an active campaign began to rally the people on behalf of the immediate summoning of the National Assembly. The delegates who had presented the petition enlisted the sympathies of all the important organizations, including groups of students, societies for political study, and mercantile association. A new journal was established to advocate the cause. Another petition which was signed by influential individuals and societies was presented in June, but refused. The progressives persisted, however, and soon a third petition was prepared. Stormy meetings were held in Peking and as a sign of patriotic fervor the participants cut off their fingers. After one of these meetings, its members, followed by a large crowd, went to the house of delegates in Peking and blamed the members for cowardice. Two leaders of the students mutilated themselves in the presence of the delegates, who finally were carried away by excitement and went to the palace of the regent with the bloodstained petition. Finally the minister of the interior agreed to present the petition for them. The court, seeing that it faced the danger of a revolution, gave way, but to save its face, left the decision with the Senate. Crowds rushed into the Senate and the petition was presented to the president by the regent. The president approved, but did not fix the date for the summoning of Parliament. The court announced that the preparations for the National Assembly would be completed in 1913, this delay being necessary for the establishment of an electoral system. The reformers were by no means satisfied with this result and continued the agitation for an earlier

date. Meanwhile the actual government, which consisted of the regent and the council of the empire, seemed utterly unable to resist the wave of reform. This was the situation at the beginning of 1911.

CREATION OF A RESPONSIBLE MINISTRY. The constitutional programme of the Chinese National Assembly, as revised by the imperial authorities, included the issue of regulations during the current Chinese year for a cabinet and for an advisory council, consisting of the present grand council under the presidency of Prince Ching. By the end of 1911 these changes were to be completed and new criminal, civil, and commercial laws issued; also a privy council was to be established. In the following year the budget was to be submitted and regulations issued for the elections, and in 1913 Parliament would be organized. In its amended form this programme was by no means satisfactory to the assembly, which sought more rapid change and demanded the immediate creation of a cabinet. Yielding to its constant pressure the throne on May 8, 1911, issued an imperial edict abolishing the grand council, grand secretariat and commission of constitutional reform and creating instead, under Prince Ching as prime minister, a general staff under two Manchu princes, and a privy council under the chancellor. The new offices were filled chiefly by Manchus.

OUTBREAK OF THE REVOLUTION. Meanwhile the revolutionary movement had been steadily gaining ground. It was quietly and ably organized and soon won the support of the intelligent and well-to-do classes. In the neighborhood of Canton it was especially active and many seditious books and pamphlets were circulated there. In September there were threats of an uprising in the province of Szechuen, where the policy of the government in the railway matter had aroused opposition. (See paragraphs above on *Communications and Army*.) But the actual outbreak occurred at Wuchang in connection with a mutiny of the troops. For some time past the troops at Wuchang had been reported to be in a dangerous mood, and on October 11, rioting broke out on account of the execution of some of the mutineers. The viceroy had to take refuge on a Chinese gunboat. Several foreign gunboats were already on the scene and the British prepared to send another one. At the same time it was learned that Hankow had become a revolutionary centre, and it was said that bombs were being manufactured in the Russian concession. The rebels declared that they harbored no hostility to the Europeans and would rigidly suppress any attempt to injure foreigners or to interfere with commerce. From the first the outbreak was evidently anti-Manchu in character and directed against the government. Soon afterwards came the news that Wuchang, Hankow, and Hanyang were in the hands of the revolutionists. The rebels issued a proclamation declaring that the Manchu dynasty would be overthrown and the rights of the Chinese revived. It added that anyone interfering with foreigners or with commerce would be put to death. It was reported by a missionary early in October that about 10,000 persons had lost their lives in the recent disturbances, and that thousands of persons in the districts around Cheng-tu were homeless.

DESOLUTORY FIGHTING IN OCTOBER. It was

soon apparent that the revolt was the most formidable uprising since the famous Taiping rebellion. It appeared that the great mass of educated Chinese in Peking were heartily in sympathy with the revolutionaries and had little regard for the corrupt Manchu dynasty. The leaders of the movement were praised for their foresight and power of organization. Among the military leaders were Brigadier-General Li Yuan-hung, who had risen from the ranks, and Huang Hsin, who had organized an attempted uprising at Canton. General Yin-chang, the minister of war, was dispatched with troops for the southern provinces on October 18. Meanwhile Hankow was occupied by the revolutionists without opposition, and it was reported that Chang-Sha, capital of Hunan, had risen. The foreign residents in Hankow and the neighboring cities were called in and took up their residence at the Hankow concessions. On October 13, it was announced that a reform government had been proclaimed at Hankow. The rebel leaders notified the consuls that they would respect the treaties and protect foreigners, provided that foreign powers did not aid the Manchus. Public sympathy was expressed with the aims of the rebels both among the Chinese and among the foreign residents. A massacre of Manchus was reported on October 13. And fast as government troops arrived they were met by revolutionaries who tried to persuade them to join the movement, and when they refused they were allowed to withdraw beyond the city limits. The leaders of the revolt declared that their object was to make China a republic and secure an honest administration of the government. An indecisive engagement occurred near Hankow on October 18. An important success of the rebels at the outset was the seizure of the provincial treasury and the arsenal of Hanyang, thus providing themselves with arms and ammunition. The weakness of their position consisted chiefly in the fact that they could be attacked readily by means of the Peking-Hankow Railway. The government plan apparently was to rush troops down to the scene of the revolt before it had got much headway. In the first encounter with the imperial troops, the Wuchang rebels were not successful, and as it was believed that 20,000 drilled troops could be brought down from Peking, and that 10,000 more were under orders from Tientsin, and an equal number from the Manchuria garrisons, the rebel cause early in October looked somewhat doubtful. Later, however, it was learned that Ichang and Chang-sha had passed peacefully into the hands of the rebels, along with other cities in the Yangtse valley and that other great cities were only waiting orders to follow suit. Between October 15 and October 20, the revolutionary forces were successful, but the imperialist troops made little resistance and the fighting was of slight consequence. The expeditionary force from Peking about 20,000 strong had reached a point about eighty-five miles from Hankow by October 22.

THE RECALL OF YUAN SHIH-KAI. An imperial edict on October 15 curtly ordering Yuan Shih-Kai to assume the vicerealty of Hunan and Hupeh and join the minister of war in putting down the revolt brought a doubtfully worded reply from that official, who excused his delay on the ground of ill health. It will be remembered in 1909 when the unexpected order came

to him to retire, it assigned the reason that he had received an injury to his foot and purported to be an act of clemency in relieving him from his duties. It was suspected generally that there was no basis for this assumption of illness and it seemed probable now that he would not recover his health unless he received full powers from the government to make terms with the revolutionaries. On October 23, it was learned that the imperialists had retreated further on the railway. The National Assembly was opened at Peking on October 22. Affairs in the capital were in great confusion and the financial condition was desperate. Many Chinese and Manchus of the better classes were leaving Peking and sending their treasure to places of safety in the foreign concessions. The ministry of finance endeavored to obtain a loan from the British, French, German, and American banks, but the latter demanded to know for what purpose the money would be used and required, before recommending its acceptance, that full power should be accorded to Yuan Shih-Kai in dealing with the situation. Yuan Shih-Kai was completely successful in imposing his own terms upon the government, whose position was hopelessly weak. The National Assembly having impeached the minister of communications, Sheng Hsuan-huai, who had long been a faithful agent of the government and was the promotor of the policy of nationalizing the railways and currency reform, the government issued an edict (October 26) declaring that he had been false to his trust and blundering in his policy. It announced that he was cashiered and would never be employed again. Sheng had for many years been Yuan Shih-Kai's political rival. Another edict appointed an imperial commission with full power over the Yangtse naval forces and the troops operating in the Hupeh province. Yuan Shih-Kai was to have complete authority in order to put down the revolution, and the ministry of war and the general staff were not to have any control. He was made virtually a military dictator, and Yin Chang, the Manchu minister of war, was recalled to Peking.

THE THRONE'S HUMILIATION. Another decree on October 30, appealed to the mercy of the people. The throne took upon itself the blame for unwise choice of ministers, for unconstitutional acts and misgovernment, saying that these things had led to the rebellion. It promised to give proper force to the constitution and establish reform, based on the people's will. Later, Yuan Shih-kai was appointed prime minister, and Prince Ching became president of the privy council. No Chinese subject ever before had received such extended powers as Yuan Shih-Kai. The Emperor's apology is so remarkable a document that it is worth quoting here in full:

"I have reigned for three years and have always acted conscientiously in the interests of the people, but I have not employed men properly, not having political skill. I have employed too many nobles in political positions, which contravenes constitutionalism. On railway matters some one whom I trusted fooled me, and thus public opinion was opposed. When I urge reform the officials and gentry seize the opportunity to embezzle. When old laws are abolished high officials serve their own ends. Much of the people's money has been taken, but nothing to benefit the people has been achieved.

On several occasions edicts have promulgated laws, but none of them have been obeyed. People are grumbling, yet I do not know; disasters loom ahead, but I do not see.

"The Szechuen trouble first occurred; the Wuchang rebellion followed; now alarming reports come from Shensi and Honan. In Canton and Kiangsi riots appear. The whole empire is seething. The minds of the people are perturbed. The spirits of our nine late emperors are unable properly to enjoy sacrifices, while it is feared the people will suffer grievously.

"All these are my own fault, and hereby I announce to the world that I swear to reform, and, with our soldiers and people, to carry out the constitution faithfully, modifying legislation, developing the interests of the people, and abolishing their hardships—all in accordance with the wishes and interests of the people. Old laws that are unsuitable will be abolished. The union of Manchus and Chinese, mentioned by the late emperor, I shall carry out. The Hupeh and Hunan grievances, though precipitated by the soldiers, were caused by Jui-cheng. I only blame myself because I mistakenly appreciated and trusted him.

"However, now finances and diplomacy have reached bedrock. Even if all unite, I still fear falling, but if the empire's subjects do not regard and do not honor fate and are easily misled by outlaws, then the future of China is unthinkable. I am most anxious day and night. My only hope is that my subjects will thoroughly understand."

THE REVOLUTIONARY DEMANDS. The demands of the revolutionary troops were the perpetuation of the Ta-ching dynasty; the calling of Parliament this year; the drafting of a constitution by Parliament which shall not require approval by the throne; the initiation of future constitutional changes by Parliament and not by the Throne; the naval and military forces to be under Parliament's control when serving within the empire and under the emperor's control when employed elsewhere; the throne not to pronounce sentences of death and all imprisonments to follow due process of law; amnesty to all political offenders; Parliament to select the premier and appoint the ministers of state; all treaties affecting national interests, adding to the people's burdens to be approved by Parliament before receiving the emperor's signature; budgets to be approved by Parliament before going into effect; election of members of Parliament to be in accordance with certain rules determining their qualifications; methods of calling Parliament and establishing constitutional government, and the settlement of important questions to be subject to the approval of the army.

THE GRANT OF CONSTITUTIONAL GOVERNMENT. The abasement of the Throne was complete and was marked by the issue of most humiliating edicts, praising the insubordinate generals and taking the revolutionists into the service of the state. The national assembly at Peking had formulated by the beginning of November nineteen fundamental principles of government, in most respects the same as those of the revolutionaries as outlined above. On November 3 the throne issued an edict unreservedly accepting them. Their text was as follows:

1. The Ta-ching Dynasty shall reign for ever.
2. The person of the emperor shall be inviolable.

3. The power of the emperor shall be limited by a constitution.

4. The order of the succession shall be prescribed in the constitution.

5. The constitution shall be drawn up and adopted by the Sze-cheng-yuan and promulgated by the emperor.

6. The power of amending the constitution belongs to Parliament.

7. The members of the upper house shall be elected by the people from among those particularly eligible for the position.

8. Parliament shall elect and the emperor shall appoint the premier, who will recommend the other members of the cabinet, these also being appointed by the emperor. The imperial princes shall be eligible as premier, cabinet ministers, or administrative heads of provinces.

9. If the premier, on being impeached by Parliament, does not dissolve Parliament, he must resign, but one cabinet shall not be allowed to dissolve Parliament more than once.

10. The emperor shall assume direct control of the army and navy, but when that power is used with regard to internal affairs he must observe special conditions to be decided by Parliament; otherwise he is prohibited from exercising such power.

11. Imperial decrees cannot be made to replace the law except in the event of immediate necessity, in which case decrees in the nature of a law may be issued in accordance with special conditions, but only when they are in connection with the execution of a law or what has by law been delegated.

12. International treaties shall not be concluded without the consent of Parliament, but the conclusion of peace or a declaration of war may be made by the emperor; if Parliament is not sitting, the approval of Parliament to be obtained afterwards.

13. Ordinances in connection with the administration shall be settled by acts of Parliament.

14. In case the budget fails to receive the approval of Parliament, the government cannot act upon the previous year's budget, nor may items of expenditure not provided for in the budget be appended to it. Further, the government shall not be allowed to adopt extraordinary financial measures outside the budget.

15. Parliament shall fix the expenses of the imperial household and any increase or decrease therein.

16. Regulations in connection with the imperial family must not conflict with the constitution.

17. The two Houses shall establish the machinery of an administrative court.

18. The emperor shall promulgate the decisions of Parliament.

19. The Sze-cheng-yuan shall act upon articles 8, 9, 10, 12, 13, 14, 15, and 18 until the opening of parliament.

SPREAD OF THE REVOLT.—The plan of Yuan Shih-Kai was to ascertain the views of the revolutionaries and to frame a compromise on the basis of a constitutional monarchy, responsible to the ministry and Parliament. The throne having accepted in its edict of November 3 the assembly's draft of the principles of the constitution, issued another edict on November 5 enjoining an immediate summoning of Parliament as soon as the rules had been drawn up and its members elected. Meanwhile Shanghai, which

had been one of the chief centres of the agitation, went over peacefully to the side of the revolutionists, and leading revolutionists, including Wu Ting-fang, former minister to the United States, were appointed to high official positions there. There were signs of discontent with the Peking National Assembly. The border provinces protested that it had exceeded its powers, and it was feared that compromise might fail. The difficulty was increased by the assassination by the Manchus of General Wu Lu-ch'en, who had been made governor of the Shansi province and had made terms with the mutinous troops. During the first week in November all the region around Shanghai was in the hands of the revolutionists and many of their leaders were saying that things had gone too far to admit of any concessions to the throne, and that the National Assembly did not represent the people. By the first week in November the revolt had spread throughout central China.

YUAN-SHIH-KAI. On November 8 the National Assembly elected Yuan-Shih-Kai premier by a vote of 78 out of 87, and he arrived at Peking with a large body of troops on November 13, having met several revolutionary leaders on the way and discussed with them measures of pacification. An edict was immediately issued extending his powers, and practically placing him in command of the entire northern army, including the imperial guards and the forces about Peking. His presence had a quieting effect at first, but the difficulties before him were very serious. He had first to form a cabinet and appoint important officials. Then came the task of reconciling the revolutionists, who were insisting on the abdication of the emperor and the establishment of a federal republic, to the plan for a limited monarchy approved by the more moderate party. The republican movement seemed steadily to be gaining ground. Hankow and Nanking had been recaptured by the imperialists on November 1. At the latter city the Manchus massacred large numbers of the suspected revolutionists and November 10 the rebels were besieging it and its fall seemed certain. Meanwhile Hankow had been nearly destroyed by fire. On November 8 Canton declared itself a republic and elected a temporary provincial president and vice-president. The rebel provinces were planning to send delegates to Shanghai to form a provisional republican government. The revolutionary leaders, Wu-Ting-fang and Wen Tsung-pao, of whom the former had been designated foreign minister for the proposed republic, issued an appeal to the world at large to unite with them in urging the prince regent to abdicate and bring the strife to an end. The memorial recited the vices of the Manchu régime and pronounced its cause hopeless, fourteen provinces having already declared their independence. Yuan-Shih-Kai, however, continued to advocate the retention of the Manchu dynasty as a limited monarchy, alleging the danger of dissension and partition under a federal republic and declaring his belief that a great majority of the people were conservative and content with the old régime. On November 16 he announced the members of his cabinet. Of the ten ministers only one was a Manchu. He offered the portfolio of commerce and industry to one of the revolutionary leaders. Toward the end of November the situation seemed more favorable to the moderate government led by Yuan Shih-Kai.

It was announced toward the close of the month that Wuchang, the stronghold of the revolutionists, had capitulated and later came the news that the revolutionary leader, Li Yuan-hung, was willing to accept the terms proposed by Yuan-Shih-kai. On November 29 the latter issued an edict reporting the recapture of Han-yang and announcing that an amnesty would be granted and that he was ready to send delegates to a national conference in Shanghai with delegates from all the provinces. On the same day the revolutionists recaptured Nanking.

PEACE NEGOTIATIONS. At the end of November both sides showed a desire to reach a compromise. The revolutionary general, Li Yuan-hung, submitted to Yuan Shih-kai, through the British minister and consul, a request for a three days' truce. This was granted (November 30) and on December 4, Yuan Shih-kai granted a request for its extension for fifteen days pending a discussion of plans for peace. Delegates under Tang Shao-yi as chief envoy were appointed to confer at Shanghai with delegates from the revolutionary provinces and the first meeting was held there on December 18. Meanwhile on December 6 an edict was issued announcing the resignation of the regent. The consuls of the great powers chiefly interested in China had been active in bringing about the peace negotiations. The United States government took the initiative in the matter, addressing an additional note to the six great powers, asking their opinion as to the best means of protecting the interests of foreigners during the revolutionary disturbances, and suggesting that joint action would be prudent as removing the temptation of any one nation to take advantage of the situation for its own selfish interests. Out of this came a concerted attempt of the powers to end the conflict. On the meeting of the peace envoys, the main question was between a limited monarchy under the Manchu dynasty and a republic. Leading revolutionaries showed a willingness to accept a limited monarchy if the Manchus were removed. It was arranged that on December 20 the consuls of the United States, Great Britain, Japan, France, Germany, and Russia should address an identical note to Tang Shao-yi, the imperialist government's representative, and Wu Ting-fang, foreign minister of the revolutionary provisional government. The course of the foreign powers was carefully planned to avoid the appearance of a forcible intervention. It was ostensibly a mere tender of good offices, though it implied that if conditions arose which endangered the foreign residents it might be necessary for their governments to take active measures.

A few days later Yuan-Shih-Kai declared that the people must pronounce upon the form of government for China and suggested that a national convention should be summoned to decide what the form should be. Upon the acceptance of this proposal the premier submitted it to the throne on December 28. He strongly urged its acceptance, and the throne finally consented. An edict was thereupon issued declaring that the princes and the members of the imperial clan agreed to let the cabinet arrange regulations for a national conference and for an extension of the armistice. The cabinet was instructed to inform the peace delegates that the throne would abide by the decision of a representative convention as to the form of government. Meanwhile, Yuan-Shih-Kai had

been making vain attempts to secure a loan of \$10,000,000 for the payment of troops in order to retain control of the northern provinces. It was expected at the close of the year that the imperial family would soon leave Peking. At the end of December, Sun-Yat-Sen (q. v.), long a prominent figure in the revolutionary movement, though he had not taken part in the hostilities, was elected president by the provisional republican convention which met at Nanking. He promised to drive the Manchus from the throne, to restore peace, to establish a government on a popular basis, and then to resign and leave the choice of his successor to popular election.

MONGOLIA AND TURKESTAN. In the latter part of December it was announced that Mongolia had declared its independence, and that at the same time Turkestan would cut loose from the authority of China. It was also reported that the Kutuktu, the religious head of the Mongol Buddhists, was proclaimed khan (December 27). During the past ten years China had attempted to bring Mongolia, which had previously possessed a large measure of autonomy, into closer dependence upon the imperial government. A movement for independence had existed there for some time and was largely religious in character. Charges of China's incapacity and corruption were made by the natives, who accused the ambans or governors of plundering them and enriching themselves at their expense. The news of Mongolian independence was followed immediately (December 28) by a request on the part of Russia that China should at once resume control of Mongolia. In the distracted condition of the empire, the Chinese government replied that it was unable to do this. It appointed, however, commissioners to repair to Urga, the chief city of Mongolia, for the purpose of persuading the natives to return to their allegiance to the empire. There was much speculation as to the outcome of the Russian demand, which was held to mean that Russia would annex Mongolia and Turkestan or would at least establish a protectorate over the former country. The Russian press, however, declared that the proper course for the government to pursue was not annexation, but the guarantee of the independence and autonomy of Mongolia. It was believed that the old order in Mongolia could not be restored. The failure of Yuan Shih-Kai's efforts on behalf of the Manchu dynasty furnished the occasion for Mongolian independence.

THE PLAGUE. During the first four months of 1911 the pneumonic plague spread with great virulence to many parts of the empire. Its origin was attributed by some to the marmot, a rodent found in great numbers through Manchuria and valued for its fur. Hunters took the plague-stricken animals and became infected. In October and November, Manchouli, the chief centre of the trade in the marmot, becomes overcrowded each year. The first case of the epidemic broke out in the neighborhood of that city in the autumn of 1910. Deaths followed in great rapidity and finally in the first week of November it spread to Harbin, where the chief Chinese officials showed themselves negligent, and even opposed the taking of medical measures; but the Russian authorities were active, and soon a number of physicians were working with energy to stay the progress of the disease. It continued to increase, however, and in Harbin the deaths rose in January to 160 a day. Dur-

ing that month also it appeared in different parts of the empire. Manchurian refugees fled to the south and the plague was spreading toward Hankow. At Harbin, in February, 1700 deaths were reported to have occurred since its outbreak in the Russian zone alone. By the middle of that month it had crept over the whole of northern Manchuria and was reported in the neighborhood of Astrakhan in Russia. Toward the end of February there were rumors of its spread to distant parts of Europe and fears of its becoming epidemic in the west, but in the following month it began to decline and by the middle of April it had died out. The death roll was estimated at 60,000. It was compared to the virulent pestilences of the Middle Ages. In the Chinese quarters of Harbin, with a population of 35,000, including the floating element, the deaths were placed at 5138. The mortality, however, was far inferior to that of the bubonic plague in India, with which, indeed, it could not be compared in point of destructiveness. An international conference met at Mukden in April at the invitation of the Chinese government to investigate its cause and suggest means of prevention.

OPIMUM TRADE. At the end of 1907 an agreement between the English government and China provided for a reduction of the exports of opium from India at the rate of 5100 chests a year, beginning January 1, 1908, providing China reduced native production at the same rate. This arrangement was renewed at the end of 1910 and was to continue until the trade, which was estimated at 51,000 chests a year, had expired. China, however, wished to terminate the opium trade before the end of the period and many believed it could be brought to an end within a year or two. The campaign carried on in China against the use of opium caused a reduction of the imports to a figure considerably below that anticipated and there was no longer any doubt as to the sincerity of the government in dealing with the question. Negotiations were therefore begun in the spring of 1911 for the shortening of the period, and the exclusion of opium as an article of trade by the denunciation of the treaty of Tientsin. China proposed that England should end the traffic as soon as China had suppressed entirely the native production. A serious difficulty lay in the disposal of the accumulated stock valued at nearly £4,000,000, and since this came in under existing treaty rights, purchased by the Indian government, the latter must be held responsible if these rights were abrogated. China proposed the compulsory sale of the accumulated stock within six months after the formation of the new agreement. Against this, however, the opium merchants protested as certain to force down the price. The main obstacle to the agreement was that the Indian government had to consider the interests of Indian subjects and save them, so far as possible, from loss, whereas the Chinese government was intent upon its policy of suppressing opium consumption. However, an arrangement was reached after negotiations, and on May 8, 1911, a new opium agreement between the British and Chinese governments was signed. This provided that since China had adopted a rigorous policy for prohibiting the production and trade of opium, the British government agrees that the export from India shall cease in less than seven years if proof is given that the production of native opium shall

diminish annually in the same proportion that the annual Indian export diminishes. Moreover, no Indian opium is to be conveyed to any province of China which has suppressed the cultivation and import of native opium. In June the British foreign office published the report of a government expert who had made a careful study of opium production on the spot. This declared the opinion that poppy cultivation had been suppressed in the provinces of Shansi and Szechuen, and cut down by about 75 per cent. in Yunnan. He estimated the reduction in Shansi at possibly 30 per cent. and in Kansu at something less than 25 per cent. In July, 1911, China gave notice that after December 1, 1911, the entry of Turkish and Persian opium would be forbidden. In the confusion of the revolution, during the closing months of the year, the anti-opium regulations were disregarded, especially in Szechuen, where increased cultivation was reported, and in Yunnan where, it was said, the revolutionary government had officially sanctioned the poppy planting.

The Opium Conference which had been appointed at the suggestion of the United States to be held at The Hague on July 1, 1911, was deferred to December 1.

RUSSIA AND CHINA. Difficulties in renewing the treaty of 1881 led to serious friction between Russia and China early in the year. On February 19 a Russian note was presented at Peking, demanding the right to impose import duties within a certain distance of the frontier zone, the guarantee of extra territorial jurisdiction over Russian subjects except in civil cases, the trial of legal suits between Russians and Chinese by mixed tribunals, freedom of trade, travel and residence for Russian subjects in Mongolia and on both slopes of the Celestial Mountains north of the Great Wall, the appointment of consuls at Kobdo, Hami, and Hucheng, proper facilities for consuls and the right of Russians to acquire land where Russia is entitled to have consuls. The last five of these points were based on the treaty of 1881. China on her part claimed indemnity for the expulsion of Chinese inhabitants from towns on the east of Amur and for destruction of property during the Russo-Japanese War. After some further negotiations Russia dispatched a note peremptory in tone and virtually an ultimatum. This demanded unequivocal consent on the six points above mentioned. On March 28 it was announced that the Russian government had received a note from China which it regarded as a full and satisfactory acceptance of Russia's interpretation of the treaty of 1881 and as an evidence of friendly feeling.

OTHER EVENTS. The negotiations for an American loan begun in the autumn of 1910 resulted in an agreement on April 15, 1911, whereby banking representatives of the four powers, United States, Great Britain, Germany, and France, subscribed to a loan of \$50,000,000 for the reform of the currency and for the industrial development of Manchuria. Mr. Knox, the American secretary of state, declared the object of the United States was to enlist the interests of the powers in the maintenance of the integrity of the Chinese empire. Another important loan was consummated on May 20 by the signature of contract between the groups of foreign financiers and the minister of communications. This was the contract in which the

American group secured an equal participation with the British, German, and French groups as a result of the negotiations of 1910 in a loan of \$30,000,000 secured on certain specific revenues of Hupeh and Hunan. It provided for a railway line 600 miles long from Wuchang, the capital of Hupeh, through Changsha, capital of Hunan, to the southern border of that province, under British engineers; the building of 400 miles in Hupeh from Ichang to Kuanshuei, under German engineers; and of 200 miles in Hupeh from Ichang to the border of Szechuen, under American engineers. On May 9 arrangements were made on the transfer of the post office to the ministry of communications. Since the post office was established in 1900, there had been a rapid advance in its development under the efficient management of Theophile Piry, whose services were retained under the new arrangement. The death of Sir Robert Hart (q. v.) on September 21 was a severe loss to the Chinese service. The plans for a modern university in central China, furthered by committees representing universities in Great Britain, the United States, and Canada, were discussed at meetings in England and America, and made progress during the year.

CHINESE IMMIGRATION. See IMMIGRATION AND EMIGRATION.

CHING, Prince. See CHINA.

CHOLERA. The United States was threatened with a cholera epidemic during 1911, both from the Atlantic and Pacific coasts. The disease reached the Hawaiian Islands by way of Japan, but no cases secured entry to the country from this direction. A few actual cases and many suspects came to the port of New York in ships from Italian ports and several deaths occurred in quarantine. Two outside cases developed, one in Auburn and one in Brooklyn, and another case was reported in Boston. The rigid enforcement of quarantine regulations, however, prevented any further spread of the disease. The present pandemic began in India in 1902 and in that year spread to China and the Philippine Islands. Since that time the disease has gradually but steadily extended, both by caravan routes and by sea, until Persia, Arabia, Egypt, Syria, Palestine, and Asia Minor were infected. Outbreaks also subsequently occurred in Russia, a few cases were reported from Germany, and during the latter part of 1910 rather severe outbreaks occurred in different parts of Italy and the Madeira Islands. In Italy down to November 1, 1911, 14,803 cases were reported, with 5661 deaths. See VITAL STATISTICS.

CHOSEN. See KOREA.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. This society numbered in 1911 3,953,850 members, organized in 79,077 societies. The membership is chiefly in the United States and Canada, but it is found also in Australia, China, India, Japan, and other countries. The 25th International Christian Endeavor Convention was held at Atlantic City, N. J., July 6, 1911. The reports showed that great gains had been made in the work of the society during the year. The effort made for several years to secure a fund for \$200,000 for an international headquarters building had resulted in receiving over \$155,000 in cash and pledges, with \$20,000 more available, leaving a balance of \$25,000 at the time of the meeting of the convention. The work

of the society included efforts against Sunday labor and for hospitals and missions and work among negroes. The officers of the society are Francis E. Clark, president, and William Shaw, general secretary.

CHRISTIAN SCIENTISTS. See RELIGIOUS DENOMINATIONS.

CHRISTIANS, or CHRISTIAN CONNECTION. This denomination had in 1910 87,478 communicants, 1329 churches, and 998 ministers. The general polity of the body is congregational and each church is independent in its organization. The general agent for the churches in the conduct of general work is the American Christian Convention which includes the Mission Board of the Christian Church and the Christian Publishing Association. In 1910 the denomination had 1149 Sunday schools, with 10,510 officers and teachers. Missions are carried on in Japan and Porto Rico, and various homes are maintained for aged Christian ministers at Castile, N. C. The organ of the denomination is *The Herald of Gospel Liberty*, the oldest religious newspaper in the United States. This is published in Dayton, Ohio.

CIVIC FEDERATION, NATIONAL. The work of the federation during 1911 was concentrated on the following subjects: Regulation of industrial corporations, regulation of railroads and municipal utilities, banking and currency, taxation, reform in legal procedure, pure food and drugs, commercial measures drafted by the commissioners on uniform State laws, workmen's compensation, and industrial mediation and arbitration. To further this work have been organized State councils in thirty-one States. Meetings were held by these councils during the year. Their chief purpose is to urge uniform State legislation, to work for the coordination of State with federal legislation where conflict now exists, and to aid in securing federal legislation on interstate matters that are conceded in the interest of public welfare. At the eleventh annual meeting held in January, 1911, a committee was appointed by President Low to consider the subject of State and federal regulation of combinations. Twenty thousand questionnaires were sent out by this committee to merchants, manufacturers, bankers, lawyers, representatives of labor, and others for the purpose of obtaining their views with a view to proposing a substitution or amendment to the Sherman Anti-Trust act. In answer to these

16,000 opinions were received. Of these 20 per cent. asked for the repeal of the law and 84 per cent., while not wishing a repeal, declared that the present form is not clear. Important work was done during the year by the department on workmen's compensation and by the committee on reform of legal procedure, which had cooperated with a similar committee of the American Bar Association. This joint committee is endeavoring to secure through Congressional action a simplified practice act for the federal courts which can be used by the State councils of the Federation as the basis for a reform practice act in the several States. This bill passed the House at the last session of the 61st Congress, but did not reach the Senate. A national department on food and drugs was organized October 2, 1911, under the chairmanship of John Hays Hammond.

Other departments of the Federation include the Conciliation Department, the Industrial Economics Department, Employers' Welfare Department, and the Woman's Department. The officers of the Federation are as follows: President, Seth Low; vice-presidents, Samuel Gompers, Nahum J. Bachelder, Ellison A. Smyth, and Benjamin I. Wheeler; treasurer, Isaac N. Seligman; chairman of the executive council, Ralph M. Easley; secretary, D. L. Cease.

CIVIL SERVICE. FEDERAL CIVIL SERVICE. There were on June 30, 1911, approximately 391,350 officers and employees of the federal civil service. Of these 227,657 held positions subject to competitive examination under the civil service rules, an increase of 5849 during the year. About 6500 were unclassified laborers subject to tests of physical fitness under the labor regulations. Of the 163,693 persons whose positions are not subject to competitive examination under the civil service rules, 10,064 were Presidential appointees, 7994 being of the first, second, and third classes. There were 37,009 fourth-class postmasters. Of minor employees, chiefly laborers on the Isthmian Canal work, there were 28,199; 3562 were employees of the Department of Commerce and Labor, chiefly in the Census Bureau. These were all appointed through examination or some other method prescribed by the Thirteenth Census act. There were 18,142 unclassified employees in the field service, and in the navy yards approximately 25,000 mechanics and laborers subject to appointment under navy yard regulations. Those excepted from examination under different rules of the civil service numbered 23,589.

During the year ending June 30, 1911, 23,256 persons were appointed, transferred, or promoted upon examination, to positions in the competitive classified service, and 2099 were transferred, promoted or reinstated on certificate without further examination. Including appointments to the Philippine service, to the Thirteenth Census force, and to positions of mere unskilled labor, 25,293 appointments were made as the result of competition.

POLITICAL ACTIVITY OF OFFICE-HOLDERS. During 1911 there were comparatively few instances of political activity of office-holders, and with one or two exceptions the cases which were noted were of only ordinary importance. This was particularly significant as the fiscal year includes the political campaign in the fall of 1910. The reason for the apparent decrease in political activity and political solicitation is undoubtedly that employees and the public in gen-

eral are becoming better informed as to the civil service act and rules and of the resolute stand of President Taft in support of them. There were no convictions during the year for violations of the statutes relating to the solicitation and receipt of political assessments. During the year it was found that appointments to the federal service at New Orleans were dependent to a large degree upon the recommendations of political leaders who sought to secure political contributions in exchange for influence in appointment. The testimony in the case was laid before President Taft and this action was followed by the resignation of the postmaster and the collector of internal revenue, against whom the principal charges had been made.

EXTENSIONS OF CLASSIFICATION. The Civil Service Commissioners believe that a wider application of the principle of filling the higher administrative positions now unclassified by the promotion of classified employees would be distinctly in the interest of efficiency, stability, and a higher standard in the personnel of the service. This belief is shared by President Taft and he has made recommendations to bring this about in several messages, including the message to Congress in December, 1911. In this message he recommended to Congress the enactment of a law applying the various civil service regulations to the diplomatic and consular service. A bill known as the Lowden bill was introduced to bring this about. This bill classifies and grades the secretaryships in the diplomatic services and provides for a board of examiners in both the diplomatic and consular service.

STATE CIVIL SERVICE. An important addition to civil service legislation was accomplished during the year in the passage by the Illinois legislature of an act amending State civil service laws in important particulars. Measures designed to improve the civil service were also passed by the Connecticut legislature, while a State-wide civil service law applying to the State and county service was defeated in California. In New Jersey the provisions of the State civil service law for several towns and cities was accepted by referendum. For civil service in general in relation to cities, see **MUNICIPAL GOVERNMENT**.

NATIONAL CIVIL SERVICE REFORM LEAGUE. This organization, which is devoted to the extension of civil service and the enforcement of civil service laws, held its annual meeting in Philadelphia on December 14 and 15, 1911. Charles W. Eliot, president, was ill in Ceylon, and Moorfield Storey, vice-president of the league, presided. President Eliot's address, reviewing the work of the league during the year, was read at the meeting. An address was delivered by Hon. Rudolph Blankenburg, mayor of Philadelphia. Resolutions were adopted urging certain reforms in civil service laws, especially measures forbidding any display of partisanship or any political activity by public servants in the competitive, classified, federal service. Recommendations were made that the rule prohibiting any partisan activity be at once extended to all federal officeholders whose political opinions cannot properly affect their official duties. Reports were made by committees on superannuation, on civil service in dependencies, and on consular reform. The president elected for 1911-12 was Charles W. Eliot.

CLAIRVOYANCE. See **PSYCHICAL RESEARCH**.

CLARK, CHAMP. See **UNITED STATES**, paragraphs *Campaign and Congress*.

CLARK, J. SCOTT. An American educator, died December 28, 1911. He was born in Copenhagen, N. Y., in 1854 and graduated from Syracuse University in 1877. After acting as principal of the Evanston High School for several years he was appointed in 1882 instructor in rhetoric, English composition, and elocution at Syracuse University. In 1892 he was appointed professor of English language in Northwestern University. He was the author of *A Practical Rhetoric* (1886); *A Briefer Practical Rhetoric* (1888); *The Art of Reading Aloud* (1892); *A Study of English Prose Writers* (1898); *A Study of English and American Poets* (1909) and *The Shorter Poems of Robert Browning* (1909).

CLARKE, ALBERT. An American soldier and economist, died July 16, 1911. He was born at Granville, Vt., in 1840 and was educated at the Barre Academy. He enlisted in the 13th Vermont Infantry in 1862 and served with distinction in the Civil War. At its close he became editor of the *St. Albans Messenger* and from 1883 to 1885 was on the staff of the *Boston Daily Advertiser*. He became editor of the *Rutland Herald and Globe* in 1886. In 1889 he was chosen secretary of the Home Market Club in Boston and editor of the *Home Market Bulletin*, now the *Protectionist Magazine*. From 1899 to 1902 he was a member of the United States Industrial Commission. He was judge-advocate-general of the Grand Army of the Republic in 1897. He was the author of many addresses and pamphlets dealing with protection.

CLARKE, Sir CASPAR PURDON. An English art director, died March 29, 1911. He was born in London in 1846. Although educated as an architect, from the time when he was twenty years old until he came to the United States to assume the directorship of the Metropolitan Museum of Art in 1905, he was connected in one capacity or another with the South Kensington Museum in London. In the year of his graduation from the architectural school he was awarded a national medallion for architectural design and for the next two years he was engaged by the English government in preparing plans for remodeling the heating and ventilating systems of the Houses of Parliament. On the conclusion of his work he was transferred to the Architectural Works Department of the South Kensington Museum and was engaged on drawings for architectural courts of that museum and for the Bethnal Green Museum. In 1870 he went to Italy to superintend reproductions in that country for the South Kensington Museum. Here he remained one year. In 1872 he completed the Church of St. Mark, Alexandria, and afterwards began a series of journeys through the East, purchasing art objects for the museum, in the meantime superintending the building of the British consular and legation buildings in several cities in Persia. When the work of constructing and inspecting these buildings was finished he continued his travels, visiting Russia, Greece, Turkey, Syria, Italy, and Germany, making purchases in these countries for the South Kensington Museum. In 1878 he was appointed architect to the Royal Commission for the Paris Exposition of 1878 and agent for the government of India. He received at the same time medals for art work and the decoration of the

Legion of Honor. In 1880 he became directly connected with the Indian Department of the South Kensington Museum and spent several years in India purchasing art works for this department. In 1884 he visited the United States for the purpose of studying dormitories for women students. These studies resulted in the building of Alexandra House in Kensington. In 1885 he again visited India to arrange for the Colonial and Indian Exhibition and was architect to the Indian and Chinese art exhibition of that year and to the Colonial and Indian exhibition of the year following. He was awarded a gold medal at the Paris Exposition of 1889 for his services as architect to the British Indian section. The same year he was appointed keeper of the art section of the South Kensington Museum and in 1891 assistant art director. Five years later he was appointed director and was knighted. In 1905 he was appointed director of the Metropolitan Museum, New York City. His long and varied museum experience in the Far East made his services of especial value to the museum and his sympathy with industrial art helped to give it the breadth of development which it manifested in the five years in which he held office. In 1910 he was obliged to resign on account of ill health. He became the European correspondent, and a yearly pension of \$5000 was voted to him by the directors. He wrote and lectured much on art matters and was recognized as the first living authority on Oriental textiles.

CLARKE, RICHARD H. An American lawyer, died May 24, 1911. He was born in Washington, D. C., in 1827 and graduated from Georgetown University in 1846. In 1848 he was admitted to the bar in Washington and practiced there until 1865. He appeared as counsel in many important cases at the Washington bar. One of these established the validity at common law of building associations, and another that the municipal government issuing bonds or certificates of indebtedness out of a particular fund is liable generally for the debt in case such fund was not provided for by the municipality. In 1865 he was admitted to the New York bar. He was associated with Charles O'Connor in several important cases, including the Jumel will case and the case of the United States against Jefferson Davis for treason. He was also chosen to investigate and report on the claims of the heirs of Anneke Jans. He was one of the original members and founders of the Association of the Bar of the City of New York. He was the editor of *The History of the Bench and Bar of New York* and was the author of *Lives of the Deceased Bishops of the Catholic Church of the United States*, *The Illustrated History of the Catholic Church in the United States*, *Life of Pope Leo XIII.*, *Old and New Lines on Columbus*, and *France's Aid to America in the War of Independence*. He was for several years president of the New York Catholic Protectorate.

CLARKE, THOMAS B., PRIZE. See ART.

CLARK UNIVERSITY. An institution of higher learning at Worcester, Mass., founded in 1889. The chief aim of the university is the encouragement of original research, although it includes an undergraduate college department. This, however, is a distinct organization in itself. There were enrolled in the various departments of the university in 1910-11 116 students, with 25 members of the faculty. In the col-

lege there were 186 students and 37 members of the faculty. There were no notable changes in the faculty of either the university or college during the year and no noteworthy benefactions were received. The endowments of the university and collegiate departments amounted to \$1,500,000 each. The library has an endowment of \$800,000 and the art department of \$100,000. The university includes nine departments. It publishes the *American Journal of Psychology*, *The Pedagogical Seminary*, and the *American Journal of Religious Psychology and Education*. The president of the university is G. Stanley Hall, and the president of the collegiate department is Edmund C. Sanford, who was formerly professor of experimental and comparative psychology at the university. The library contains about 50,000 volumes.

COAL. This article deals only with the subject as a whole. For information relating to the production in different States and amounts thereof, see the paragraph *Mineral Production* under those States.

PRODUCTION. The production of coal in the United States in 1910 was the largest in the history of the coal-mining industry in the country. For the first time the output exceeded half a billion short tons. The combined production of anthracite, bituminous, and lignite coal amounted to 501,576,895 short tons. This great output was attained in spite of the fact that most of the mines in Illinois, Missouri, Kansas, Arkansas, and Oklahoma were closed down for nearly six months by one of the most bitterly contested strikes in the history of the industry. Previous to 1910 the heaviest tonnage mined in a year was 480,363,424 short tons in 1907. The production in 1909 was 460,814,616 short tons. Excepting for the States affected by the strike order, the increase in production was general among the more important States. The output of anthracite in Pennsylvania increased from 72,384,249 long tons, or 81,070,350 short tons, in 1909 to 75,433,246 long tons or 84,485,236 short tons, in 1910. The bituminous production including semi-anthracite, semi-bituminous, and other varieties, increased from 379,744,257 short tons in 1909 to 417,111,142 short tons in 1910. The most important increases in production in 1910 were in the States that benefited from the idleness in the Mississippi Valley States. The largest increase in tonnage was made by the bituminous coal mines of Pennsylvania, 12,554,735 short tons. West Virginia was second, followed by Ohio, Kentucky, Indiana, and Alabama.

VALUE. The year 1910, in addition to having the largest tonnage on record, was one of generally higher values. With but one or two minor exceptions, the percentage of increase in value was larger than that of the increase in tonnage in the States where gains were shown, and the percentage of decrease in value was smaller where a loss of tonnage was shown.

MEN EMPLOYED. The coal mines in the United States gave employment in 1910 to 725,030 men, of whom 169,497 were employed in the anthracite mines of Pennsylvania and 555,533 were employed in the bituminous and lignite mines.

The anthracite workers averaged 229 days during the year and the bituminous and lignite workers averaged 217 days, the general average being 220 days. The average production per man in the anthracite mines was 498 short tons for the year and 2.17 tons for each working day, and in the bituminous and lignite mines, the average production per man was 751 tons for the year, and 3.46 tons for each working day.

LABOR TROUBLES. As indicated above, the year 1910 was notable for labor troubles in coal mines. In the bituminous coal-producing States where operations were carried on under agreement with the United Mine Workers of America, the compacts are for two years and terminate on March 31 of the "even" years. Consequently in 1909 there were no general strikes or suspensions. There were, to be sure, local disaffections, but they were generally of short duration and were not sufficient to affect the total production. The spring and summer of 1910, on the contrary, were a period notable for one of the most prolonged labor conflicts that ever occurred in the bituminous coal fields of the United States. The anthracite fields in Pennsylvania were not affected except in a few unimportant instances, the operators and miners having in 1909 renewed for a third term of three years the awards of the Anthracite Strike Commission of 1902-3. The centre of the disturbances in 1910 was in

the bituminous fields of Illinois and the South-western States, in the Irwin-Greensburg districts of Pennsylvania, and to a less extent in Iowa and Michigan. The total number of men on strike in the bituminous coal fields was 215,640 out of a total of 555,533. The average time lost by each man was 89 days and the total time lost was equivalent to 19,234,785 working days.

CONSUMPTION. Practically the entire output of both anthracite and bituminous coal in the United States is consumed within the country. The effort on the part of some of the operators in the Eastern States to build up an export trade has resulted in a considerable expansion of business along this line, of some importance in itself, but of comparative insignificance when considered with the total production. The total quantity of coal exported in 1910 was 15,462,570 short tons, or a little over 3 per cent. of the production. The consumption of coal of domestic production was 486,133,808 short tons. The imports of coal in 1910 amounted to 1,686,612 short tons, which added to the consumption of domestic coal made the total consumption of that year 487,820,420 short tons or 97.25 per cent. of the domestic production.

The following table shows the production and value of coal in the various States of the Union in 1909-10:

State or Territory	1909		1910	
	Quantity	Value	Quantity	Value
Alabama	13,703,450	\$16,306,236	16,111,462	\$20,236,853
Arkansas	2,377,157	3,523,139	1,905,958	2,979,213
California and Alaska	48,636	107,342	12,164	33,336
Colorado	10,716,936	14,296,012	11,973,736	17,026,934
Georgia and North Carolina	211,196	298,792	177,245	259,122
Idaho	4,553	19,459	4,448	17,426
Illinois	50,904,990	53,522,014	45,900,246	52,405,897
Indiana	14,834,259	15,154,681	18,389,815	20,813,669
Iowa	7,757,762	12,793,628	7,928,120	13,903,913
Kansas	6,986,478	10,083,384	4,921,451	7,914,709
Kentucky	10,697,384	10,079,917	14,823,319	14,405,887
Maryland	4,023,241	4,471,731	5,217,125	5,835,058
Michigan	1,784,692	3,199,351	1,534,967	2,930,771
Missouri	3,756,530	6,183,626	2,982,433	5,328,285
Montana	2,553,940	5,036,942	2,920,970	5,329,322
New Mexico	2,801,128	3,619,744	3,508,321	4,877,151
North Dakota	422,047	646,142	399,041	695,139
Ohio	27,939,641	27,789,010	34,209,668	35,932,288
Oklahoma (Indian Territory)	3,119,377	6,253,367	2,646,226	5,867,947
Oregon	87,276	235,085	67,633	235,229
Pennsylvania bituminous	137,966,791	130,085,237	150,521,526	153,029,510
Tennessee	6,358,645	6,920,564	7,121,380	7,925,350
Texas	1,824,440	3,141,945	1,892,176	3,160,965
Utah	2,286,899	3,751,810	2,517,809	4,224,556
Virginia	4,752,217	4,251,056	6,507,997	5,877,486
Washington	3,602,263	9,158,999	3,911,899	9,764,465
West Virginia	51,849,220	44,661,716	61,671,019	56,665,061
Wyoming	6,393,109	9,896,848	7,533,098	11,706,187
Total bituminous	379,744,257	405,486,777	417,111,142	469,281,719
Pennsylvania anthracite	81,070,359	149,181,587	84,485,236	160,275,302
Grand total	460,814,616	554,668,364	501,596,378	629,557,021

WORLD PRODUCTION The total coal production of the world in 1910 was approximately 1,300,000,000 short tons, of which the United States contributed about 39 per cent., by far outstripping all others. The United States has held first place among the coal producing countries of the world since 1899, when it surpassed Great Britain. The table below gives the production of the different countries for the latest dates available. For further details, see remarks on mining in the articles on the different countries.

Country	Usual unit in producing country	Equivalent in short tons
United States (1910) long tons	447,853,909	501,596,378
Great Britain (1910) long tons	264,292,588	296,007,699
Germany (1910) metric tons	222,301,660	245,043,120
Austria-Hungary (1909) metric tons	49,509,016	54,573,788
France (1910) metric tons	38,570,473	42,516,232

Country	Usual unit in producing country	Equivalent in short tons
Belgium (1910) metric tons	23,927,230	26,374,986
Russia and Finland (1910) metric tons.....	22,650,000	24,967,095
Japan (1909) metric tons	14,973,617	16,505,418
Canada (1910) short tons	12,796,512	12,796,512
China (1909) metric tons	12,000,000	13,227,600
India (1909) long tons...	11,870,114	13,294,528
New South Wales (1909) long tons	7,019,879	7,862,264
Spain (1909) metric tons	4,124,761	4,546,713
Transvaal (1910) long tons	3,970,069	4,446,477
Natal (1910) long tons...	2,296,439	2,572,012
New Zealand (1909) long tons	1,911,247	2,140,597
Mexico (1909) metric tons	1,300,000	1,432,990
Netherlands (1909) metric tons	1,120,852	1,235,515
Queensland and Victoria (a) long tons...	999,739	1,119,708
Italy (1909) metric tons	555,073	611,857
Sweden (1909) metric tons	246,808	272,056
Cape Colony (1909) long tons	92,428	103,519
Tasmania (1909) long tons	83,790	93,845
Other countries (b) long tons	4,675,806	5,236,903
Total		1,278,577,812
Percentage of the United States		39.2

a Queensland figures are for 1910; Victoria, 1909.

b Includes Turkey, Servia, Portugal, Chile, Borneo, Peru, Greece, etc.

Although the production of coal in the United States in 1911 was probably second only to that of the record year 1910 when the half billion ton mark was passed, there have been, according to the reports of the United States Geological Survey, few more unsatisfactory years in the history of the coal mining industry. For the most part the year was one of overproduction and of a struggle for trade, which depressed prices. In Pennsylvania there was an exception to these conditions. There the mining of anthracite coal exceeded the previous highest record of 1907 by approximately 3,000,000 tons. The total amount mined during 1911 was about 85,000,000 long tons. The total production of bituminous coal in 1911 was from 3 to 5 per cent. less than in 1910 or from 20,000,000 to 33,000,000 tons in quantity. The total production aggregated between 385,000,000 and 398,000,000 short tons, as compared with 417,111,142 in 1910. The bituminous coal trade was in a more or less demoralized condition during the year. The principal cause for this, particularly in the Eastern States, was the depression in the iron trade, which was more seriously reflected in the coking coal districts.

COAL EXPORTS. The official report on coal exports issued at the close of the year was as follows: Coal exports from the United States have trebled in value in the last dozen years. The value of coal passing out of continental United States in the year 1911 is, in round terms, 80 million dollars, compared with 65 million dollars in the immediately preceding year. The stated value of coal exported in the ten months ending with October, 1911, is 44 million dollars, that of coke, 3 million dollars, and that of coal supplied to vessels engaged in the foreign trade, 18 million dollars, making a total of 65 million dollars and justifying the Bureau of Statistics of the

Department of Commerce and Labor in its statement that the aggregate value of coal passing out of the United States in the full calendar year will approximate 80 million dollars.

The United States ranks third among the coal exporting countries of the world, being exceeded in this respect by the United Kingdom and Germany. In 1910, the latest year for which comparisons can be made, the coal exports of the United Kingdom were valued at 179 million dollars, those of Germany at 104 million dollars, those of the United States, exclusive of bunker coal, 45 million dollars and those of France, about 6 million dollars. The exports of the United States have grown far more rapidly, however, than those of any of the countries named. Comparing the figures of 1910 with those of 1900, exports of coal and coke (exclusive of bunker coal) from the United States have increased from 23 to 45 million dollars, or practically 100 per cent.; those of Germany increased from 65 to 104 million dollars, or 60 per cent.; while those from the United Kingdom decreased from 183 to 179 million dollars. Those of France show little change during the decade, coal exports from that country having increased from 6¼ to 6½ millions in the period from 1900 to 1910.

Canada is the principal destination of the coal exported from the United States, being credited with \$15,126,207 out of a total of \$15,335,856 worth of anthracite and \$21,510,604 out of a total of \$28,732,888 worth of bituminous coal exported in the ten months ending with October, 1911. Of the other markets for bituminous coal from the United States the principal countries are Cuba, Mexico, and Panama, each taking between \$1,000,000 and \$2,000,000 worth annually. Canada is also the largest market for our exported coke, having received during 1910 about three-fourths of the entire exports, while practically all the remainder went to Mexico.

Coal now ranks seventh among the leading articles of exportation in the foreign commerce of the country. Coal in the value of its exports exceeds such important articles as cotton manufactures, tobacco, leather, agricultural implements, corn, and cotton seed oil; while if we add to the exports of coal to foreign countries the value of that sold for use on vessels engaged in the foreign trade, the total, 80 million dollars, would closely approach that of wheat and flour, wood manufactures, or copper.

COAST ARTILLERY. See **MILITARY PROGRESS.**

COAST TRADE. See **UNITED STATES, Commerce.**

COCAINE HABIT. The spread of this habit among the negro population of certain Southern States caused some concern. District Attorney St. Clair stated before the New Orleans Board of Health that, according to police reports, there were 20,000 to 25,000 negro cocaine habitués in that city, and that a number of them were being sent to the penitentiary and insane asylums every week. A bill was therefore introduced into the Louisiana legislature prohibiting the unauthorized sale of habit-forming drugs.

A similar state of affairs was reported in Mississippi. In Philadelphia, the cocaine traffic

seemed to have revived. The peddling of cocaine and opium, which had been stopped by the State Pharmaceutical Board in the spring of 1911, after a campaign lasting more than six months, started again, so quietly, however, that no attention was attracted to it until, on December 20, a man arrested in Chinatown was found to have more than \$500 worth of cocaine and \$10 worth of opium on his person. An investigation was started, and the federal officials resolved to start a campaign which would not end until every drug vendor in the city was placed under arrest. Indian newspapers declare that cocaine is being smuggled into India in large quantities. It is said to be introduced by means of books, bicycle tires, and by other ingenious methods, and the drug is reported to come

from Germany and Austria. As a result, the habit is growing rapidly.

COCHIN-CHINA. A state of French Indo-China (q. v.). Area, 21,988 square miles. Population in 1906, 2,870,514. The delta regions are very fertile, and extensive irrigation and drainage works are in progress. Area under cultivation, 5,011,277 hectares (rice, 1,358,706 acres, yielding in 1909 1,500,000 tons). Live-stock: 11,243 horses, 241,744 buffaloes, 109,071 cattle, 709,380 swine, 3492 sheep and goats. The fisheries products are valued at 2,800,000 francs yearly. Saigon, the capital, has the largest trade in French Indo-China. The local budget balanced (1911) at 5,561,680 piasters. The trade is included in that of French Indo-China. Governor (1911), J. M. Gourbeil.

* The coins of silver-standard countries are valued by their pure silver contents, at the average market price of silver. † Not including Costa Rica. ‡ Gold standard adopted December 31, 1908; 12½ Bolivianos equal the pound sterling or Peruvian pound (4.866½). § The sovereign is the standard coin of India, but the rupee (\$0.324 1-3) is the current coin at 15 to the sovereign. ¶ Customs. ** Seventy-five centigrams fine gold. ** Value in Mexico .498.

COCKROFT, JAMES. An American publisher and editor, died November 12, 1911. He was born in New York City in 1842. After studying law he engaged in the law publishing business with his uncle, Peter Voorhees. He went to Chicago, where he founded the business still conducted by Callahan & Co. After the great fire of Chicago he returned to New York where he edited the *American and English Encyclopædia of Law*. He was the founder of the firm which afterwards became the Edward Thompson Company. He edited the *Encyclopædia of Pleading and Practice* (1895); and the *Encyclopædia of Forms and Precedence* (1895):

COINS, FOREIGN VALUE OF. The table on page 188 gives the value of foreign coins in United States currency at the close of 1911.

COINAGE. See UNITED STATES.

COKE. The quantity of coke produced in the United States in 1910 exceeded that of any previous year in the history of the industry. The combined output from beehive and retort ovens amounted to 41,708,810 short tons, valued at \$99,742,701. The output in 1909 amounted to 39,315,065 short tons, valued at \$89,965,483. There was an even larger relative increase in value than in quantity in 1910. The average price advanced from \$2.29 per ton in 1909 to \$2.39 in 1910. Of the total production in 1910, 35,570,076 tons, or 82.88 per cent., were produced in beehive ovens, or in ovens in which the process is one of partial combustion, and 7,138,734 tons, or 17.12 per cent., were produced in by-product ovens, or in ovens in which the process is one of distillation. The quantity of coal consumed in the manufacture of coke in 1910 amounted to 63,088,327 short tons, valued at \$74,846,393. The total number of ovens in 1910 was 104,440, as compared with 103,982 in 1909. At the end of the year there were 2567 ovens in the course of construction. Pennsylvania leads the States in the production of coke. In 1910 there were produced in that State 26,315,607 short tons, valued at \$55,254,590, as compared with 24,905,525 tons, valued at \$50,377,035 in 1909. West Virginia ranks second with 3,803,850 tons, and Alabama third, with 3,249,027 tons. Other States producing over a million tons were Colorado, Illinois, and Virginia. The total number of establishments in Pennsylvania in 1910 was 288 with 55,656 ovens. In West Virginia were 135 establishments, with 19,912 ovens, and in Alabama 43 establishments, with 10,132 ovens. The imports of coke in 1910 amounted to 172,716 short tons, valued at \$625,130, as compared with 191,253 short tons, valued at \$736,120 in 1909. The exports amounted to 984,562 short tons, valued at \$3,053,292, as compared with 1,002,916 short tons, valued at \$3,232,673 in 1909.

By-PRODUCTS OF COKE. For many years the valuable materials constituting the by-products in the manufacture of coke were absolutely wasted. This was due largely to the employment of the old beehive type of coke oven rather than a by-product oven. Experiments have been carried on for many years in Germany and other foreign countries for utilizing the by-products of coke. In what is known as the beehive oven the coal is only partly consumed, or to speak more properly, the volatile combustible constituents, the gas, tar, and ammonia, everything indeed except the fixed carbon which is left behind as coke, is wasted. In the by-

product ovens it is recovered and used. In Germany little or no coke is now made except in retort or by-product ovens, and these are coming into use quite generally in the United States. The first ovens of this type were built in 1893 at Syracuse, N. Y. In 1910 there were 4078 in operation in the United States. The efficiency of the by-product ovens is shown by the fact that while the beehive ovens in 1910 produced 34,570,076 short tons of coke on a consumption of 53,559,285 short tons of coal, the retort ovens in the same year produced 7,138,734 short tons of coke on a consumption of 9,529,042 short tons of coal, or a saving of nearly 10 per cent.

The total value of the by-products obtained from the manufacture of coke in retort ovens in 1910 was \$8,479,557, or a little more than one-third of the value of the coke produced. These by-products include 27,692,858 cubic feet of surplus gas, valued at \$3,017,908; 66,303,214 gallons of tar, valued at \$1,599,453; 70,247,533 pounds of aluminum sulphate or its equivalent, valued at \$1,841,062; 20,229,421 pounds of anhydrous ammonia, valued at \$1,725,266, and 4,654,382 gallons of ammonia liquor, valued at \$295,868. In addition to this there was a small quantity of light and secondary oil and small quantities of coke breeze recovered, with an estimated value of \$400,000. The value of the recoverable or wasted contents of the coal made into coke in beehive ovens would, at the prices obtained in 1910, have been between \$35,000,000 and \$40,000,000.

What was said to be the largest Koppers by-product coke and gas-oven plant in the world was built in 1911 by the Indiana Steel Company for their Gary, Ind., works at a cost of \$6,000,000. It consists of 560 ovens arranged in eight batteries of seventy ovens each, with a charge capacity of thirteen tons of coal per oven, and a coking period of eighteen hours. The daily consumption of the plant was 9500 short tons of coal, and the yield was 8000 tons of coke, with ammonia sulphate and tar as by-products. In these ovens 95,000,000 cubic feet of gas are produced daily, of which 50 per cent. is used in the steel works, and 50 per cent. in heating the ovens. This plant has a most modern electrical equipment for handling the coal and coke. The Koppers ovens were first introduced into the United States in 1907, after having been used considerably in Europe; 1411 had been built up to 1911.

COLD STORAGE OF MEATS. See STOCK-RAISING AND MEAT PRODUCTION.

COLGATE UNIVERSITY. An institution of higher learning at Hamilton, N. Y., founded in 1819. The enrollment of students in 1910-11 was as follows: College, 403; theological seminary, 40; academy, 105. The faculty of the college numbered 30, of the theological seminary, 13, and of the academy, 10. There were no changes of importance in the faculties of these schools during the year. The college received the gift of a thoroughly equipped infirmary to be used for hospital purposes by the students of Colgate University. The amount of the productive funds is about \$2,000,000. During the year a new dormitory building, which will house about 70 students, was completed. The library contains about 60,000 volumes. The president is Elmer Burritt Bryan.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLLIER, PRICE. See LITERATURE, ENGLISH AND AMERICAN, *Travel and Contemporary History*.

COLLINGWOOD, FRANCIS. An American engineer, died August 20, 1911. He was born in Elmira, N. Y., and was educated in the academy of that city and at the Rensselaer Polytechnic Institute, from which he graduated in 1855. From 1865 to 1869 he was city engineer and from the latter year to 1883 he was assistant engineer of the East River Bridge construction. From 1895 to the time of his death he was expert examiner in the New York Civil Service. From 1895 to 1904 he was lecturer on foundations at New York University. He was a member of many engineering societies in the United States and Europe.

COLLINS, Sir RICHARD HENN, Baron. A British jurist, died January 3, 1911. He was born in Dublin, Ireland, in 1842 and was educated at Trinity College, Dublin, studying afterwards at Cambridge. He was called to the bar in 1867 and became queen's counsel in 1883. His chief legal interests were in the law of business and he participated in many famous lawsuits relating to railway litigation, municipal law, and complicated business matters in general. In 1861 he was raised to the bench in place of Sir James Stephen, who resigned. In 1897 he was appointed a Lord Justice of Appeal and in 1901 he was appointed Master of the Rolls. Perhaps the most notable case in which Lord Collins was concerned was the celebrated Beck case, in which Adolf Beck was wrongly convicted and sentenced for a series of frauds. Eight years later he was rearrested on similar charges and by a succession of accidents his innocence was proved. A committee was appointed to examine and report upon this miscarriage of justice, and Lord Collins was appointed chairman. The disclosures in the Beck case in some measure led to the introduction of Lord Loreburn's act constituting the Court of Criminal Appeals. On the death of Lord Davey in 1907, Collins was made Lord of Appeal in Ordinary under the title of Baron Collins of Kensington. He gave many judgments both in the House and in Privy Council. He resigned this appointment in October, 1910. He was an arbitrator of the Venezuelan boundary question in 1897 and from 1901 to 1907 was chairman of the Historical Manuscripts Commission. He was joint editor of *Smith's Leading Cases*.

COLMAN, NORMAN JAY. An American agriculturist, died November 3, 1911. He was born in Richfield Springs, N. Y., in 1827. He was educated in the district schools, and in 1847 he removed to Kentucky where for several years he engaged in teaching. He graduated from the Louisville Law School in 1851 and practiced law in Indiana until 1852 when he removed to St. Louis. He became interested in agriculture and established *Colman's Rural World*, which he edited until the time of his death. He served in the Civil War as lieutenant-colonel of the 85th enrolled Missouri militia. In 1855-56 he was a member of the Missouri House of Representatives. He was a candidate for lieutenant-governor in 1868, but was defeated. He was, however, elected for the term 1875 to 1877. From 1885 to 1889 he was

United States Commissioner of Agriculture and when that department was elevated to an executive branch of the government he became first Secretary of Agriculture. He presided over a convention of delegates from agricultural colleges in the United States in 1885 and urged the adoption of laws creating the present system of experiment stations in connection with agricultural colleges in the United States. He was selected by a commission to head the Government Horse Breeding Farm at Fort Collins, Colorado, for the establishment of a breed of American trotting-bred carriage horses. For twenty years he was a member of the Missouri State Board of Agriculture. He was the founder and first president of the Missouri State Horticultural Society. For two years he was president of the Missouri State Press Association.

COLOMBIA. A northwestern republic of South America. Capital, Bogotá.

AREA, POPULATION, ETC. The area is variously estimated at from 435,100 to 465,700 sq. miles. In 1910 the population was estimated at 4,320,000, exclusive of some 60,000 uncivilized Indians, but great uncertainty exists as to the actual number of inhabitants, and in 1911 an executive decree provided for the taking of a general census. Municipal populations also are known with little exactness. The population of Bogotá, sometimes estimated at 150,000, has recently been placed at 101,496; Medellín, 54,946; Barranquilla, 43,849; Cartagena, 30,000. Primary instruction is free, but not compulsory. There are several normal schools and a few establishments for professional education. The total number of pupils and students in the republic in 1910 is reported at 239,987, attending 3877 institutions. The state religion is Roman Catholicism.

INDUSTRIES. Agriculture and mining are the chief industries. The products include bananas, coffee, tobacco, cacao, sugar-cane, cotton, rubber, and cereals. The estimated number of cattle is about 4,000,000. The mineral resources of the country, especially in Antioquia, are very great. There are rich deposits of copper, lead, zinc, mercury, iron, platinum, salt, and other minerals. The famous emerald mines of Muzo, seventy-five miles north of Bogotá, are leased by the government to an English syndicate. Manufactures are comparatively unimportant, though various articles of common use, as shoes, matches, sugar, liquor, etc., are produced in some of the larger towns.

COMMERCE. Value of imports and exports, in United States money:

	1907	1908	1909	1910
Imp. ..	\$12,088,563	\$13,513,892	\$12,117,927	\$17,025,637
Exp. ..	13,791,442	14,998,744	16,040,198	17,625,153

The figures for 1909 are in correction of \$10,561,047 for imports and \$15,513,346 for exports, previously given out by the Colombian statistical officer. The leading imports include flour, cotton textiles, petroleum, sugar, and lard. Coffee exported in 1909, \$6,339,119; bananas, \$1,117,787; animals and hides, \$1,553,082; Panama hats, \$825,646; tobacco, \$428,129; vegetable ivory, \$407,795; rubber, 383,544; cacao, \$236,076. Precious metals exported in 1909 and 1910 respectively: Gold in bars, \$2,150,804 and \$2,293,569; gold dust, \$901,329 and \$1,076,691; silver in bars, \$176,127 and \$407,660; platinum,

\$154,401 and \$260,633. Over half of the total exports go to the United States. Barranquilla is the chief port, with Cartagena second.

COMMUNICATIONS. Colombia has no continuous railway system, but there are various short lines engaged in local traffic. Total length of railway reported in operation at end of 1910, 980 kilometers (609 miles). There was under construction by the Pacific Railway of Colombia a section from Buenaventura on the Pacific to the valley of Cauca, which had been completed to a point sixty miles from the coast, where an important tunnel was being built, while fifteen miles beyond this point work was under way. This line will extend eventually to Bogotá, the capital. Telegraph offices, 524, with 17,181 kilometers (10,676 miles) of line. Post offices, about 500.

FINANCE. For several years the government has experienced serious financial difficulties and has counted itself successful when able to maintain the value of the paper currency, as compared with gold, at a ratio of 100 to one. The gold dollar, or peso, is equivalent to the United States dollar, the silver peso fluctuates with the price of silver, and the paper peso is legally current at one cent. Revenue for 1909, \$14,437,100, of which \$6,560,159 customs and \$2,037,117 liquor tax. The budget for 1910 balanced at \$10,831,500; for 1911, revenue \$9,570,500, expenditure \$10,831,500. Foreign debt, £2,666,400 (also the government guarantees railway bonds, £492,000, and interest on railway bonds, £1,480,000); internal debt (1910), \$3,290,169. There is an enormous outstanding paper currency.

ARMY. A law making military service compulsory for all able-bodied citizens is not uniformly applied, and a standing army of some 6000 men is maintained. Those who have served with this army are held as an unorganized reserve.

GOVERNMENT. The executive authority is vested in a president, elected by the Congress for a (constitutional) term of four years and assisted by a cabinet of seven ministers. The Congress consists of the Senate and the House of Representatives, members of the former (35) being chosen by indirect vote, and of the latter (92) by direct, for four years. In 1904 Gen. Rafael Reyes was elected president; in the following year, by congressional resolution, his term of office was extended to ten years, dating from January 1, 1905. In the summer of 1909 he resigned, and on August 3 Gen. Ramón González Valencia was designated by the Congress to serve for one year. On July 15, 1910, the Congress elected Carlos E. Restrepo, who was inaugurated on the 7th of August following for a four-year term. First and second designados (elected September 25, 1911), Marco Suárez and José María González Valencia, respectively.

HISTORY. A general election was held in February, indicating by its results that the people generally supported the existing government. By executive decree the province of Arauca was cut off from the jurisdiction of the department of Boyacá and is to be governed by a special commission. There was trouble between Colombia and Peru on account of the latter's occupation of Puerto Córdoba in territory claimed by Colombia. A battle was fought at Coquila and the defeat of the Colombians with heavy loss was reported. The dispute had been settled by arbitration, but news did not

reach the opposing sides until too late to avert the battle.

COLORADO, POPULATION. The Thirteenth Census taken in 1910 showed a population for the State of 799,024, as compared with 539,700 in 1900, an increase of 48 per cent. in the decade. The principal cities with their population in 1910 and 1900 are as follows. The figures in parenthesis are for 1900. Denver, 213,381 (133,859); Pueblo, 44,395 (28,157); Colorado Springs, 29,078 (21,085); Leadville, 7508 (12,455); Cripple Creek, 6206 (10,147). The figures for the last two cities show a decrease. They owe their founding to mining enterprises, and as the mines become less widely operated there is a movement of a portion of the population elsewhere.

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1910. On that date there were in the State 46,170 farms, as compared with 24,700 in 1900. The land in farms amounted to 13,532,113 acres, as compared with 9,474,588 in 1900. The improved land in farms amounted to 4,302,101 acres. The average acres per farm was 293.1. The value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$491,471,806, as compared with a value of \$161,045,101 in 1900. The average value of property per farm was \$10,645, compared with \$6520 in 1900. The average value of land per acre was \$26.81, as compared with \$9.54 in 1900. Of the 46,170 farms in the State in 1910 37,780 were operated by owners and managers and 8390 by tenants. Of the farms operated by their owners, 26,822 were free from mortgage and 9636 were mortgaged. Of the operators and managers of farms, 37,198 were native white, 8398 were foreign-born white and 574 were negro or other non-white. The value of the various kinds of domestic animals, and poultry and bees in 1910 was \$70,161,344, as compared with a value in 1900 of \$49,954,311. The cattle numbered 1,127,737, valued at \$131,017,303; horses and colts, 294,035, valued at \$27,382,926; mules, 14,739, valued at \$1,798,935; swine, 179,294, valued at \$1,568,158; sheep and lambs, 1,426,214, valued at \$6,586,187. The poultry of all kinds numbered 1,721,445, valued at \$1,012,251. The acreage, production, and value of the principal crops in 1910 and 1911 are shown in the following table:

	Acreage	Prod., bu.	Value
Corn1911	373,000	5,222,000	4,073,000
.....1910	346,000	6,885,000	4,131,000
Wheat1911	438,000	8,274,000	6,950,000
.....1910	403,000	8,994,000	7,376,000
Oats1911	290,000	10,150,000	4,872,000
.....1910	284,000	11,104,000	5,103,000
Rye1911	21,000	252,000	176,000
.....1910	20,000	280,000	188,000
Potatoes ..1911	90,000	3,150,000	3,118,000
.....1910	86,000	8,600,000	4,730,000
Hay1911	707,000	a 1,414,000	13,150,000
.....1910	700,000	1,400,000	15,120,000

a Tons.

MINERAL PRODUCTION. The value of the mineral products of the State in 1910 was \$80,357,715, compared with a value in 1909 of \$59,190,424. The State was in 1910 first in the production of gold. The total gold production in 1910 was valued at \$20,507,058, as compared with a value of \$21,846,600 in 1909. Of the gold produced, the value of that produced by

the Cripple Creek district was \$11,002,253. The State ranks fourth in the production of silver, being surpassed only by Montana, Utah, and Nevada. The total silver production in 1910 was 8,509,598 fine ounces, as compared with 8,846,300 fine ounces in 1909. The zinc produced in 1909 amounted to 77,089,648 pounds. There was a great increase in the lead production on account of discoveries in Leadville in 1909-10. The State produces a large amount of lead. In 1910 there were produced 19,249,503 pounds. Large quantities of copper are also mined. In 1910 this amounted to 8,339,535 pounds, a considerable decrease from the production of 1909, which was 11,485,631 pounds.

The production of gold in the State in 1911, according to the estimates of the Director of the Mint, was 926,568 fine ounces, valued at \$19,153,860. This is a considerable falling off from the production of 1910, which was 992,028 fine ounces, valued at \$20,507,058. This gave the State second rank in production, as the output of California in 1911 surpassed this. The silver produced in 1911 was 7,530,940 fine ounces, valued at \$4,142,017. This also showed a decrease from the output of 1910.

In the production of coal Colorado ranks first among the States west of the Mississippi and seventh among all the coal producing States. There were produced in 1910 11,973,736 tons, valued at \$17,026,934, as compared with 10,716,936, valued at \$14,296,012 in 1909. The increased demand for Colorado coal was caused in part by the cessation of work among the miners in the Southwestern States on account of the strike. There was also a better demand for domestic fuel. Nearly 50 per cent. of the coal mined in the State is produced in Las Animas county. A notable feature of the development of the year was the increased production of Routt county. The development in this county has dated almost entirely from 1908, when 13,000 tons were produced. In 1910, 258,452 tons were mined.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the State control are as follows: State House, State Insane Asylum, Soldiers and Sailors' Home, Industrial Workshop for the Adult Blind, State Home and Training School for Mental Defectives, State Industrial School for Boys, State Industrial School for Girls, State Penitentiary and State Reformatory. The appropriation for the maintenance of these institutions in 1911 was \$895,000 and for improvements \$208,700, making a total of \$1,103,700. The legislature of 1911 passed an unusually large number of important measures relating to charities and corrections of the State. One of these regulated the sentencing of first offenders to the State Reformatory, and others provided for the better administration of the affairs of the State Board of Charities and Corrections. Several public conferences were held during the year in which subjects pertaining to the welfare of the unfortunate and delinquent were discussed by those interested in the philanthropies of the State.

POLITICS AND GOVERNMENT

Little of importance occurred in the political history of the State during the year. There was no State election, as the next election for State officers is to be held in 1912. The legislature was in session until May 6. The most important meas-

ures passed will be found in the paragraph *Legislation* below. The unusually long session of the legislature was due to the attempt to elect a United States senator to succeed Charles J. Hughes, who died in 1910. It was found impossible to secure enough votes for the election of any candidate, and the legislature therefore adjourned without having made a choice. Colorado, therefore, has but one representative in the United States Senate in the Sixty-second Congress. On December 3 Senator Guggenheim announced that he would not be a candidate for reelection in 1913. He declared that he came to this conclusion solely because of personal interests. Senator Guggenheim was elected in 1907 to succeed Thomas M. Patterson, Democrat. He is identified with large mining interests, and during his service as senator was subjected to many attacks on account of his identification with these interests and his ownership of large mining properties. As the result of his withdrawal there will be an election for two United States senators in 1913. On May 26 the city of Denver was restrained by a federal injunction from issuing bonds or taking other steps toward installing a municipal water system on the ground that by an ordinance of 1890 an agreement had been made whereby the city gave the local water company a franchise for twenty years, and was then to renew the agreement or purchase the plant.

LEGISLATION. Among the important measures enacted at the legislative session of 1911 were the following: An act creating an auditing board in the State, a child labor law (see *CHILD LABOR*), a measure creating a court of appeals, an enactment abolishing the fellow-servant negligence existing by the common law, a measure creating drainage districts, a general election law, a law providing for factory inspection, a law creating a State tax commission, a general warehouse law, and a measure providing for the adoption of a State flag.

STATE OFFICERS IN 1911. Governor, John F. Shafroth; Lieutenant-Governor, Stephen R. Fitzgerald; Secretary of State, James B. Pearce; Treasurer, Roady Kenehan; Auditor, M. A. Leddy; Attorney-General, Benjamin Griffith; Superintendent of Public Instruction, Helen M. Wixson; Commissioner of Insurance, William L. Clayton; Adjutant-General, John Chase—all Democrats except Griffith and Wixson.

JUDICIARY. Supreme Court: Chief Justice, John Campbell, Republican; justices, S. H. White, Democrat; W. A. Hill, Democrat; M. S. Bailey, Democrat; William H. Gabbert, Republican; G. W. Musser, Democrat; James E. Garrigues, Republican; Clerk, James R. Killian, Democrat.

STATE LEGISLATURE, 1911. Democrats, Senate, 26; House, 40; joint ballot, 66; Republicans, Senate, 9; House, 25; joint ballot, 34; Democratic majority, Senate, 17; House, 15; joint ballot, 32.

The representatives in Congress will be found in the article *UNITED STATES*, section *Congress*.

COLORADO, UNIVERSITY OF. An institution of higher learning at Boulder, Colo., founded in 1876. The number of students enrolled in the various departments of the university in 1910-11 was 1100. The faculty numbered 187, including lecturers and assistants. Homer C. Washburn was appointed professor of chemistry, and Carbon Gillespie, M. D., was appointed professor of anatomy. No noteworthy benefactions

were received during the year. The present income of the university amounts to about \$250,000 a year. A school of pharmacy was established in September, 1911. Two years' college work is required for entrance to the Medical School. The last two years of the medical course is in Denver. Two years' college work, beginning in September, 1912, is required for the Law School entrance. The library contains about 55,000 volumes. The president is James H. Baker, M. A., LL. D.

COLORATION. See BIOLOGY.

COLOR CHANGES. See ZOOLOGY and ORNITHOLOGY.

COLUMBIA, DISTRICT OF. See UNITED STATES.

COLUMBIA UNIVERSITY. The total number of resident students at the university in the collegiate year 1911-12 was 7981. The faculty numbered 752. The student body was divided as follows: Columbia College, 757; School of Law, 411; School of Medicine, 346; Schools of Mines, Engineering, and Chemistry, 652; Schools of Fine Arts, 151; Graduate Schools of Political Science, Philosophy, and Pure Science, 1279; Barnard College, 611; Teachers' College, 1476, and College of Pharmacy, 288. In the academic year, which ended in June, 1911, the university received from gifts slightly less than \$3,000,000. One hundred and sixty-five thousand dollars was received toward the erection of a philosophy building, and \$55,000 toward the erection of the Avery Library building. Other gifts included those of anonymous donors to establish the John W. Burgess fund of \$100,000, and of friends of the late Richard Watson Gilder to establish the Richard Watson Gilder fund for the promotion of good citizenship, \$45,362. For other gifts received during the year, see GIFTS AND BEQUESTS. The total endowment fund of the university amounted at the end of the year to \$52,433,183. The total income for the year 1910-11 was \$3,172,686. An important event in the administration of the medical department was the affiliation with the Presbyterian Hospital, which will give opportunities for hospital work to graduates of the College of Physicians and Surgeons. By the will of Joseph Pulitzer (q. v.), the foundation of a school of journalism, which he had previously endowed to the amount of \$3,000,000, was made practicable. For other notes in regard to the work of the university, see UNIVERSITIES AND COLLEGES.

CONCRETE, REINFORCED. The use of reinforced concrete for building purposes had grown so rapidly by 1911 that various shortcomings and failures in construction were apparent, as well as the many advantages of this structural material. It was the opinion of the best engineers that when reinforced concrete was properly made and used, it left little to be desired either in strength or in effective resisting properties. Nevertheless, there was not a wide understanding of the most recent and approved ideas in reinforced concrete construction, so much interest was attached to the building regulations promulgated by the building departments of New York City and Cleveland, Ohio, in which reinforced concrete was regulated. The superintendents of buildings of all of the five boroughs of New York City on December 28, 1911, adopted a new set of building regulations for reinforced concrete, to apply uniformly to all boroughs, and to take effect on January 1, 1912. This was of further interest as being the first time that uniform regulations had been adopted for all the boroughs of the city. These regulations define reinforced concrete, and state that it will be approved for all types of construction if the design is in accordance with good engineering practice, and stresses are figured as required by the regulations. The nature of the construction must be shown in complete drawings and specifications, and the proportions of the mixture are specified, as well as for the Portland cement and the other materials. Limits of stresses were prepared, and the entire regulations are exact and specific.

The amendment to the building code of the city of Cleveland, relating specifically to reinforced concrete construction and concrete block construction, was signed by the mayor on December 13, 1911, and was put into force. It may be recalled that a large structure, the Henke Building, in Cleveland, Ohio, collapsed on November 21, 1910, while in course of construction. After this failure various building interests in the city of Cleveland united to secure a new building ordinance which would include the latest knowledge of the science of reinforced concrete design and construction, and be properly complete and exact as distinguished from the previous loose official rules on concrete maintained by that city, and in general by other cities throughout the United States. These regulations go into the matter somewhat more extensively than those of the New York Building Department, but the general object is the same. See ARCHITECTURE.

During the year Mr. Thomas A. Edison proposed the construction of concrete furniture, and exhibited samples of concrete chairs and tables which had been cast and appropriately colored. Mr. Edison's plans for casting concrete houses continued to develop, but the practical application was not remarkably extensive.

CONDENSED MILK. See DAIRYING.

CONGER EEL. See ZOOLOGY.

CONGESTION OF POPULATION. See POPULATION.

CONGO, BELGIAN. A Belgian colony in central Africa; formerly the Congo Free State. Capital, Boma.

AREA, POPULATION, ETC. Estimated area, 900,000 square miles. Estimates of the indigenous population vary from nine to twenty millions. Estimate from tax rolls, between seven and eight millions. Non-indigenous population, January 1, 1910, 3399. Boma has about 10,000 inhabitants, including 500 whites. Matadi, 100 miles up the river, is the chief port. There are mission and agricultural schools. Fetishism is practiced by the natives (mainly of Bantu stock).

PRODUCTION AND COMMERCE. Rubber is the leading commercial product. Coffee and cacao are cultivated. Other articles of export are ivory, palm kernels, palm oil, tobacco, and white copal. Gold, copper (in the Katanga province), and other metals are found. Sugar and cotton can be grown successfully. With regard to the reforms projected in behalf of the natives, Great Britain, although willing to admit improvement, declines to recognize the annexation until convinced that affairs are proceeding satisfactorily. The three zones as indicated below are being opened up to free trade on the dates projected: 1st, July 1, 1910, the Lower Congo, Stanley Pool, Ubangi, Bangali, Kwango, Kasai, Katanga, the Eastern Province (southern part), and the river banks to Stanleyville; 2d, July 1, 1911, the Crown lands; 3d, July 1, 1912, the Welle and Aruwimi districts. The native population is reported to be already benefiting by the reforms, and trade begins to improve.

The trade, which is largely with Belgium, is shown for three years below, in francs:

	1908	1909	1910
Imports	32,561,300	28,482,000	36,802,000
Exports	57,383,100	78,014,000	66,588,000

Principal articles of export in the special trade (1910): Rubber, 51,015,000; ivory, 6,043,000; palm kernels, 2,657,000; gold, 2,515,000; palm oil, 1,798,000; white copal, 1,314,000; cacao, 1,071,000. Countries of origin and destination (1910): Belgium (imports 27,259,000 francs, exports 58,679,000), Great Britain (3,777,000 and 561,000), France (1,246,000 and 1,726,000), Germany (1,052,000 and 83,000), Portuguese possessions (546,000 and 3,388,000), Netherlands (621,000 and 727), Portugal (350,000 and 153,000), United States (105,000 and —). Vessels entered and cleared (1910), 488, of 627,997 tons.

COMMUNICATIONS. Railways, January 1, 1911, 925 kilometers. The Congo River is navigable for large vessels from its mouth at Banana to Matadi, where the European vessels discharge and recharge their cargo. Between Matadi and Leopoldville (Stanley Pool) a railroad completes the route, as the rapids and falls make the river unnavigable above Matadi. A line runs from Boma to the Mayumbe country; another from Stanleyville to Ponthierville, and another from Kinder to Kongolo. The route between Boma and Katanga will connect the Benguela, Congo, and Rhodesian railways from Lobito Bay to Broken Hill. Telegraph and telephone lines, about 1800 miles. Post offices, 39.

A contract for a 250-mile petroleum pipe line has been awarded to a Belgian firm; it will supply the steamers on the upper river with crude petroleum to replace wood as fuel.

FINANCE, ETC. Revenue and expenditure 1908, 29,055,173 and 33,769,236 francs respectively;

1909, 34,570,000 and 34,470,000; 1910, 33,516,779 and 40,370,814; estimate 1911, 40,501,700 and 59,012,728 (including 11,907,913 francs extraordinary expenditure); 1912, 45,367,639 and 66,538,970 (including 16,818,660 francs extraordinary expenditure). Total public debt, 214,909,700 francs. Governor-general (1911), Baron Wahia.

HISTORY. In 1911 the Belgian Congo completed its third year since its annexation. By the treaty of October 18, 1908, the Congo Free State had been annexed to Belgium. The colonial act passed soon afterwards by the Belgian Parliament provided for its administration. Although reforms were promised by the new government, there were general complaints in foreign countries that the old abuses continued. In 1909 a definite plan of reform was set forth by the colonial minister and this was embodied in the decree of March 22, 1910. Reformers, however, continued to complain of abuses in the Congo throughout 1910. Both in the United States and in England the reform programme of the Belgian government was declared to be inadequate.

In July, 1911, the Rev. J. H. Harris, organizing secretary of the Anti-Slavery and Aborigines Protection Society, and well known for his exposure of Congo abuses, reported in July considerable improvement in the conditions of the territory. He had made a journey of some 1200 miles and inquired among missionaries, traders, officials, and the natives as to the progress of the reforms. Where the reform scheme had gone into effect the results were, in his opinion, most beneficial to the people, but he found some features that occasioned anxiety as to the future, especially the heavy taxation. On April 4, 1911, Sir Edward Grey had declared in reply to a question in the British House of Commons, that there had been improvements in the administration, but that the exact nature of the situation could not be known till the consular officers who were touring the country in 1911 had reported. Great Britain meanwhile withheld her recognition of the annexation in accordance with the government's determination to wait until there was evidence of satisfactory conditions in the Congo. On November 21, British consular reports on Congo conditions were made public. These reported that conditions in general had improved, though abuses continued in those districts in which rubber is still demanded in lieu of taxation.

The question of the Congo came up in the Belgian Chamber of Deputies early in December, when M. Vandervelde, the Socialist leader, introduced a bill providing for a parliamentary inquiry into the condition of the natives and the enforcement of reforms. He charged the missionaries with the manufacture of alcoholic liquors, and with the detention of native children, and the territorial governors with the violation of the elephant hunting laws, and he said further that the condition of forced labor still remained. The colonial secretary, M. Renkin, professed ignorance of the charges brought against the territorial governors regarding violations of the hunting laws and obtaining ivory from the natives, but said that if the reports were true, measures would be taken against them. As to the missions, he said that if there were alcoholic liquors in the missions, they were for their own use, and that the reports of detention of children and of cruelties inflicted upon

them were exaggerated. The natives, whom M. Vandervelde had mentioned as victims of forced labor, were, said the minister, voluntary workers, but he said that he had given orders to respect the liberty of labor.

CONGREGATIONALISTS. In the United States, to which Congregationalism was brought by the Pilgrims, the Congregationalists constitute the eighth largest religious body. Congregationalism in its churches is found in their relation to each other, under—first, a group of churches in annual session which is called an "association"; second, all the churches of a State meeting annually called a "conference"; and third, a National Council, the constituency of which is formed by delegates in triennial sessions from the associations and conferences. The chief organizations, under the auspices of which the benevolent and missionary work of the churches is carried on, are: The American Board of Commissioners for Foreign Missions; the Congregational Education Society; the Congregational Church Building Society; the Congregational Home Missionary Society; the American Missionary Association; the Congregational Sunday School and Publishing Society; the Congregational Board of Ministerial Relief; the Woman's Foreign Mission Boards, and the Woman's Federation and Auxiliaries for Home Missionary Work. For fellowship, culture, and inspiration, so-called clubs are maintained. There are about fifty such bodies in the United States. A license to preach is granted in some States by local associations, and in other States, by ministerial associations.

The theological seminaries known as Congregational are, Yale (undenominational), opened in 1822; Bangor, 1816; Andover, 1807; Hartford, 1834; Oberlin, 1835; Chicago, 1855; Pacific, 1869; Atlanta, 1901. In these institutions are 378 undergraduates, and 117 instructors. Forty colleges were founded by Congregationalists; in these are enrolled 23,198 students. The instructors number 2019. In their libraries there are 1,716,909 volumes. The amount of productive funds is \$34,434,087.77. On January 1, 1911, Congregationalists reported 735,563 members in the United States. At that date there were reported 6033 churches, and 6033 ministers. The Sunday schools enrolled 664,973 members. For home expenses, the amount was \$8,965,894. The total of contributions was \$2,860,582, which was distributed as follows: Foreign missions, \$566,516; education, \$66,873; church building, \$73,970; home missions, \$322,837; American Missionary Association, \$139,909; Sunday school work, \$64,870; ministerial aid, \$34,434; additional Congregational work, \$618,161; undenominational, \$973,012. World-wide Congregationalism, 14,369 churches and chapels; 1,383,376 members, and 1,485,073 members in Sunday schools.

The national council, Boston, October, 1910, discovered in its discussions and resolutions a trend toward centralization for the purpose of a

larger efficiency. A committee on ministerial and religious education is at work to conserve and strengthen the intellectual culture of the ministry, and to cultivate a more scientific understanding and application of biblical literature and teaching, especially in the interest of the young. A commission on apportionment of beneficence was created with a view to developing a systematic method of gathering and assigning the contributions of the churches for missionary service. A commission of nineteen appointed to reorganize Congregationalism has already reported and recommends that the national council meet once in two years; that delegates to the council serve for two successive sessions; that at the end of each session a moderator be elected for the next; that the committee on nominations be made permanent; that the council nominate a majority of the corporate members of the American Board; that a home board of missions be created as a uniting bond between the home societies, whose board of managers shall coördinate and supervise the work of the several existing societies; that the secretaryship be enlarged in its functions. The report of the commission of nineteen will be presented for consideration to the national council at its next session.

The fifteenth session of the national council will be held in Kansas City, Mo., October 22-31, 1913. The officers are: Moderator, Rev. Nehemiah Boynton, D. D., Brooklyn, N. Y.; secretary and editor, Rev. Asher Anderson, D. D., Boston, Mass.; treasurer and registrar, Rev. Joel S. Ives, Hartford, Conn.

CONGREGATIONAL METHODIST CHURCH. This denomination had in 1911 15,529 communicants, 333 churches, and 337 ministers. The church polity in general agrees with that of the Methodist Episcopal Church. It is strongest in the Southern States. It maintains a publishing house in Ellisville, Miss., and its official organ is *The Messenger*. The only educational institution under the auspices of the denomination is the Atlanta Bible School. The last general conference of the church was held at Anniston, Ala., in November, 1909.

CONNECTICUT, POPULATION. The Thirteenth Census, taken in 1910, showed the population of the State as 1,114,736, compared with 908,420 in 1900, an increase in the decade of 22.7 per cent. The principal cities with their population in 1910 and 1900, the latter in parentheses, are given below: New Haven, 133,605 (108,027); Bridgeport, 102,054 (70,996); Hartford, 98,915 (79,850); Waterbury, 73,141 (51,139); Meriden, 32,066 (28,695); Stamford, 28,836 (18,839); New London, 19,659 (17,548); Torrington, 18,840 (12,453); Manchester, 13,641 (10,601).

AGRICULTURE. The Thirteenth Census included statistics of agriculture in the State. These are of date April 15, 1910. On that date the number of farms was 26,815, compared with 26,948 in 1900, a decrease of 133. The land in

farms was 2,185,788 acres, compared with 2,312,083 acres in 1900. The improved land in farms was 998,252 acres, compared with 1,064,525 acres in 1900. The average acreage per farm was 81.5, compared with 85.8 in 1900. The value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$159,399,771, compared with a value in 1900 of \$113,305,580, an increase of 40.7 per cent. Of the total number of farms in the State 24,183 were operated by owners and managers and 2632 by tenants. Of the farms operated by their owners, those free from mortgage numbered 13,080, and those under mortgage, 9958. The native white farmers numbered 19,841; foreign-born white, 6861; negro and other non-white, 113. Of the non-whites, 105 were negroes and 8 Indians. The value of the various kinds of domestic animals, poultry, and bees in 1910 was \$14,163,902, compared with a value in 1900 of \$10,932,312. The cattle numbered 195,318, valued at \$6,730,287; horses and colts, 46,341, valued at \$5,739,400; mules, 416, valued at \$72,721; swine, 52,372, valued at \$472,741; sheep and lambs, 22,418, valued at \$112,349. Poultry of all kinds numbered 1,265,702, valued at \$988,653. The acreage, production, and value of the principal crops in 1910 and 1911 will be found in the following table:

	Acreage	Prod., bu.	Value
Corn1911	59,000	2,862,000	2,375,000
.....1910	57,000	2,032,000	2,062,000
Oats1911	11,000	386,000	216,000
.....1910	11,000	405,000	178,000

.....1910	16,000	27,680,000	4,567,200

a Tons. b Pounds.

MINERAL PRODUCTION. Minerals are not produced in the State in large quantities. The total value of the mineral product in 1910 was \$3,505,161, compared with a value in 1909 of \$3,480,918. The lime produced in 1910 was valued at \$417,850; mineral waters, at \$109,853. Other products are clay products, stone, sand, and gravel.

EDUCATION. The number of children between four and sixteen years of age enumerated in October, 1910, was 248,595. The average attendance in the public schools in that year was 148,446, an increase for the year of 572. The number of children between four and sixteen years of age not in attendance in any school was 36,414. The State Board of Education has given much attention to trade training in the schools, in accordance with laws passed in 1910. The equipment of these schools will include machines of various kinds, printing presses and paper-cutting machines, linotypes, plumbing material, ample equipment for drafters' classes and for printers' classes. The schools include evening schools, largely for specialists and those requiring special instruction. The length of the course in the trade schools is about two years or 5000 hours of actual training.

POLITICS AND GOVERNMENT

On January 4, 1911, Simeon E. Baldwin was inaugurated governor of the State. In his first

message to the legislature he recommended that that body adjourn by the end of April, as in his opinion there was little demand for legislation. Nevertheless, his first message contained many recommendations for new laws. Among them were the proposal to print on the back of every ballot the oath taken when a man is made a voter, a proposal to regulate aviation, a law that women should, as property owners, vote in all municipal elections, and measures intended to solve the problem of the existing unequal legislation in the legislature by having senators elected from the State at large. He called for economy in State administration, and proposed to abolish, consolidate, or reduce salaries for many offices and commissions. He disapproved the ratification of the income tax proposal, and indorsed the plank in the party platform for popular election of United States senators.

In spite of the recommendation of Governor Baldwin, the session of the legislature was of unusual length. It lasted throughout the summer and finally adjourned on September 26. Several important measures were passed. Among these was one creating a public utilities commission to replace the State railway commission. Another important law provided for an industrial commission to investigate conditions under which women and minors worked. An appropriation of \$1,000,000 was made for improvements in the harbor of New London. A bill of lading act recommended by the conference on uniform laws was passed, and also a measure concerning the inspection and transportation of cattle and an act concerning the registration, numbering and use of airships and the licensing of operators. The public utilities commission mentioned above consists of three commissioners, appointed by the General Assembly upon nomination by the governor.

As the term of Senator Bulkley expired in 1911, it was necessary to choose his successor. He was a candidate for reelection. Opposed to him was George P. McLean, former governor of the State. A Republican caucus was held on January 10, and Mr. McLean received 117 votes to 63 for Senator Bulkley. As the legislature is Republican, this is equivalent to the election of Mr. McLean and he was, accordingly, elected by the legislature on January 17. No elections for State officers were held during the year. The elections were chiefly municipal. In June the voters of the city of Norwich defeated the proposition for the commission form of government. The most interesting result of the election of November 7 was the increase in the Socialist vote cast in Bridgeport. While the Republicans elected their candidate for mayor by a plurality of 280, the Socialist vote showed an increase of 600 per cent. over the vote cast in 1909. The Socialists polled approximately 6000 votes, while the Republican vote was about 5500. The Socialists elected one alderman, the first ever chosen in the history of the city.

For events connected with labor in 1911, see **ARBITRATION AND CONCILIATION, INDUSTRIAL.**

STATE OFFICERS. Governor, Simeon E. Baldwin; Lieutenant-Governor, Dennis A. Blakeslee; Secretary of State, Matthew H. Rogers; Treasurer, Costello Lippitt; Auditors, William P. Bailey and Edward S. Roberts; Comptroller, Thomas D. Bradstreet; Attorney-General, John H. Light; Commissioner of Agriculture, Governor *ex officio*; Superintendent of Education, Charles D. Hine; Commissioner of Insurance,

Theodore H. Macdonald—all Republicans except Governor.

JUDICIARY. Supreme Court: Chief Justice, Frederick B. Hall, Republican; Associate Justices, S. O. Prentice, Republican; George W. Wheeler, Democrat; John M. Thayer, Democrat; Alberto T. Roraback, Republican; Clerk, George A. Conant.

STATE LEGISLATURE, 1911. Senate, Republicans, 21; Democrats, 14; House, Republicans, 159; Democrats, 97; joint ballot, Republicans, 180; Democrats, 111; Republican majority, Senate, 7; House, 62; joint ballot, 69.

The representatives in Congress will be found in the article **UNITED STATES**, section *Congress*.

CONRAD, JOSEPH. See **LITERATURE, ENGLISH AND AMERICAN, Fiction**.

CONSERVATION. The political events connected with the subject of the conservation of public resources were concerned during the year almost entirely with Alaska and will be found treated under that head. Reference will be found also in the article **UNITED STATES. Administration and Congress**. The conservation of the national forests is treated in the article **FORESTRY**. For other phases of the question, see **IRRIGATION**, and **LANDS, PUBLIC**, and **AGRICULTURE**.

NATIONAL CONSERVATION CONGRESS. The third annual session of the National Conservation Congress was held in Kansas City, September 25-27, 1911. The special topic considered was conservation of soil. The president was Henry Wallace, of Des Moines, Ia. More than a thousand delegates were present at the meeting from every part of the United States. The programme included several notable speakers, among them President Taft, William J. Bryan, Mr. Fisher secretary of the interior, and Dr. H. W. Wiley. There were also present at the congress experts on the subjects discussed, chiefly members of faculties of the State agricultural colleges. There were two chief points emphasized by the speakers. The first was, the necessity of scientific farming to end soil robbery, and the second was the need of considering the welfare of women and children on the farm and so to make rural life attractive. The various experts in attendance upon the congress pointed out an effective remedy for treating the exhausted soil. Dr. F. B. Mumford discussed the possibility of soil conservation through animal husbandry. Other speakers discussed such subjects as acidity of soils, the use of phosphorus, legume culture, and other aspects of the feebleness and cure of soils. In relation to the welfare of the women and children living on farms, an address was made by Mrs. Harriet Wallace Ashby of Des Moines on "The Farmer's Wife." She advocated the formation of clubs for farmers' wives, the improvement of rural schools, and the establishment of social neighborhood centres. Other speakers discussed the place of the rural church, agricultural training in the schools, parcels post, and other methods for making farm life attractive. Dr. Wiley spoke of the possibility of saving lives through better sanitation and through pure food laws. The address of President Taft was, in the main, devoted to an explanation of the plan of the government to co-operate with State and county authorities in placing a farm expert, as far as possible, in every county to study particularly the conditions of

soil and climate in that county, and to act as counselor for farmers.

COPPER. This article deals in general terms with the production of copper. The statistics of production of the various States will be found in the paragraphs on *Mineral Production* under those States. The statistics are those gathered by the United States Geological Survey. The year 1910, like 1909, was one of prosperity in the copper industry. While the smelter output in the former year was slightly less than in 1909, it exceeded the output of any other year. The output of the refineries was the largest in the history of the industry. The decreased output was due largely to the fact that the production of copper was exceeding the consumption, and a general curtailment was inaugurated by the mining companies about the middle of the year. This curtailment did not affect the refinery output notably until after the close of the year. While no large new producers were added during the year, the development of ore and the preparation for production were actively carried on by several companies which entered the producing list in 1911. Among the more important of these were the companies in the Miami and Ray districts, Arizona, the Santa Rita district, New Mexico, the Yerrington district, Nevada, the Lake Superior district, Michigan, and the Copper River district, Alaska.

PRODUCTION, UNITED STATES. The production of copper in 1910 by smelters from copper-bearing materials in the United States was 1,080,159,509 pounds, valued at \$137,080,257, as compared with 1,092,951,624 pounds, valued at \$142,083,711 in 1909. The mined production in 1910 was 1,088,237,432 pounds, as compared with 1,126,521,126 pounds in 1909. Of the new copper refined, 782,171,204 pounds were electrolytic, 221,462,984 pounds were Lake, and 68,260,688 pounds casting.

During 1910 forty-eight copper smelting and refining plants treated material from the United States. Of these forty-five were domestic plants and three were foreign, two located in British Columbia and one in Mexico. Three plants which produced in 1910 were not operated in 1909. These were the Clara Consolidated Gold and Copper Company at Swansea, Ariz., the Consolidated Arizona Smelting Company at Humboldt, Ariz., and the International Smelting and Refining Company at International, Utah. Six small plants that operated in 1909 were not active in 1910, making a decrease of three in the number of plants active in 1910.

Twenty-four States and Territories contributed to the copper production of 1910. The three leading States, Arizona, Montana, and Michigan, produced 74 per cent. of the total output of 1910,

as compared with 76 per cent. in 1909. The six leading States, including Utah, Nevada, and California, produced over 96 per cent. of the total output in 1910, as compared with over 95 per cent. in 1909. The production in the various States in 1909-10 will be found in the table below:

[Smelter output, in pounds fine.]		
	1909	1910
Alaska	4,057,142	4,311,026
Arizona	291,110,298	297,250,538
California	53,668,708	45,760,200
Colorado	11,485,631	9,307,497
Georgia	724
Idaho	7,096,132	6,877,515
Michigan	227,005,923	221,462,984
Montana	314,858,291	283,078,473
Nevada	53,849,281	64,494,640
New Hampshire	88,944	12,409
New Mexico	5,031,136	3,784,609
North Carolina	120,451	181,263
Oregon	245,403	22,022
Pennsylvania	994,089	740,626
Philippine Islands	1,781
South Dakota	41,988	43
Tennessee	19,207,747	16,691,777
Texas	3,456	2,961
Utah	101,241,114	125,185,455
Vermont	1,935
Virginia	231,971	105,313
Washington	120,611	65,021
Wyoming	433,672	217,127
Missouri and unapportioned	2,159,636	603,570
Total	1,092,951,624	1,080,159,509

CONSUMPTION. Although domestic consumption and export of refined copper were in 1910 the largest in the history of the industry, yet they were not sufficient to equal the producing capacity of the country. The most essential factor in the prosperity of the industry is an increase in the consumption of refined copper. This is necessary, not that the price may be advanced materially, but in order that the additional copper supply by the new producers, both domestic and foreign, may be absorbed and the old companies may still operate their plants at full capacity. The consumption of copper has been steadily on the increase for several years. The average price for copper in 1910, 12.7 cents per pound, was the lowest since 1902, but was not far below the average for the last twenty-five years. The cost of production was probably as low as it has been in recent years, and it would have been still lower if the plants had been operated at maximum capacity.

CONSOLIDATION. One of the most striking features of the industry during the three years ending 1910 was the continued decrease in the cost of production. Companies whose copper cost in excess of fifteen cents per pound in 1907, produced at a profit in 1910, with copper averaging 12.7 cents per pound. The most important event in the copper industry in the years 1909 and 1910 was the consolidation of companies in several of the large copper districts. Among the most important of these consolidations are that of the Amalgamated interests and the Clark copper properties of Butte, Mont., as the Anaconda Copper Company, and the consolidation of the East Butte Copper Company with the interests of the Pittsburgh and Montana Copper Company and the Pittsmtont smelter. In the Lake Superior district, Michigan, the Calumet and Hecla Mining Company purchased the Bigelow interests and a consolidation of most of the companies

affiliated with the Calumet and Hecla company was under consideration at the close of 1910. In the Bingham district, Utah, the Utah Copper Company absorbed the Boston Consolidated Copper Company. It also acquired a controlling interest in the Nevada Consolidated Copper Company. In the Ely district, Nevada, the Nevada Consolidated Copper Company absorbed the Cumberland-Ely Copper Company and the Steptoe Valley Smelting Company. In the Bisbee district, Arizona, a merger of the Calumet and Arizona Copper Company and the Superior and Pittsburgh Copper Company was effected early in 1911. In the Ray district, Arizona, the Ray Consolidated Company acquired the property of the Gila Copper Company. Most of these consolidations were brought about with the idea of increasing the efficiency of operation, and of lowering the cost of production, and these ends have generally been attained. The copper output of the country is now controlled by a few groups of interests. A factor of increasing importance to the copper industry is the output of secondary copper. During 1910 the quantity of copper that has been used and returned to the industry in the form of old scrap was equal to about seventeen per cent. of the total consumption of new copper in the United States and was exceeded in amount by the individual output of new copper by only three States, Arizona, Montana, and Michigan.

IMPORTS AND EXPORTS. The imports of copper into the United States in 1910 amounted to 344,435,771 pounds, as compared with 321,801,114 pounds in 1909. These included pigs, bars, ingots, plates, old copper, etc. The exports of metallic copper from the United States in 1910 amounted to 708,316,543 pounds, which is the largest export made in any year, exceeding that of 1909, 682,846,726 pounds, by 25,469,817 pounds.

WORLD'S PRODUCTION. The smelting production of copper in the world in 1910 was 1,903,297,003 pounds, as compared with 1,873,404,407 pounds in 1909. In 1910 the smelter output of the United States was 56.75 per cent. of the world's production, as compared with 58.22 per cent. in 1909. The following table, compiled by the Henry R. Merton Co., Ltd., of London, shows the production in 1909 and 1910. The figures are reduced to pounds except that official figures for the production in the United States and Canada are inserted.

(Copper extracted from ore or contained in the ore produced.)

Countries	1909	1910
Germany	50,264,880	55,335,460
England	881,840	1,102,300
Italy	6,172,880	7,275,180
Philippines is about 1,500,000 acres, and in		
Austria	3,527,360	4,850,120

Grand total	1,873,404,407	1,903,297,003

ESTIMATES FOR 1911. Statistics and estimates received by the United States Geological Survey from all plants known to produce blister copper from domestic ores and from all Lake mines indicate that the copper output in the United States in 1911 exceeded that of 1910, and nearly equalled the record production of 1909. According to these estimates the output of blister and Lake copper in 1911 was 1,091,554,000 pounds, as compared with 1,080,159,509 pounds in 1910 and 1,092,951,624 pounds in 1909. Statistics indicate a considerable decrease in domestic consumption, as compared with 1910. The consumption, however, will exceed 700,000,000 pounds.

COPYRIGHT. The act to amend and consolidate existing copyright laws in the United States which passed on March 4, 1909, and went into effect on July 1 of that year, has been described in detail in the YEAR BOOK of 1910. It brought about an important change in the law by its provision that copyright is secured by publication with statutory notice. No important changes in the text or interpretation of copyright legislation were effected in 1911. During the fiscal year ending June 30, 1911, the registrations numbered 115,198, of which 26,970 were books (including pamphlets, leaflets, and contributions to periodicals), 23,393 periodicals, and 25,525 musical compositions.

INTERNATIONAL COPYRIGHT. The convention on literary and artistic copyright signed by representatives of the United States and nineteen Latin-American countries at the fourth International conference of American States in 1910, was sent by the President to the Senate on January 26, 1911, and its ratification by that body occurred on February 15. The signatories were the United States, Brazil, Argentina, Colombia, Costa Rica, Chile, Cuba, the Dominican Republic, Haiti, Ecuador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador, Uruguay, and Venezuela. On December 8, 1910, the President had issued a proclamation admitting German subjects to the benefits of Section I. (e) of the 1909 copyright act. Similar proclamations were issued on behalf of Norway, Belgium, and Luxemburg, on June 14, 1911, and on behalf of Cuba on November 7, 1911. Reciprocal copyright relations with Sweden (not including protection against infringement in the case of mechanical reproduction of music) were proclaimed by the President on May 26, 1911.

GREAT BRITAIN. The important copyright measure presented to Parliament in 1910, which alters materially the existing law, was passed in the latter part of 1911, and was to go into effect

on July 1, 1912. Among the chief changes introduced are the following:

The scope of copyright extended to include mechanical instruments such as perforated rolls, "records," cinematograph films, architectural designs, etc.; statutory protection substituted for common-law protection against infringing; the formality of registration abolished; summary redress provided for trade in infringing copies; the term of copyright extended and varied. As redefined, copyright may apply to any literary, dramatic, musical, or artistic work, including the delivery of lectures, sermons, and addresses, the dramatizing of novels, the "novelizing" of dramas, and the making of any contrivance for the reproduction of sound or pictures. Infringement does not include quotation for purposes of fair criticism, the use, with acknowledgment, of short passages from copyrighted works other than school-books, the reporting of public lectures unless prohibited by printed notice, the reading in public of reasonable extracts, etc. Action must be begun within three years from the alleged infringement. Copyright holds during the lifetime of the author and for fifty years after his death; but after thirty years from the date of the author's death (twenty-five years in the case of works published after the passage of the act), any person may publish his work on giving notice and paying a royalty of 10 per cent.; and if heirs or assigns unreasonably hold an author's work from publication, the owner of copyright may be constrained to permit reproduction, on complaint to, the judicial committee of the Privy Council. No assignments of copyright, unless made by will, subsist for more than twenty-five years from the author's death. The act applies throughout the British empire, subject, however, to rejection or modification by the self-governing colonies of Canada, Australia, South Africa, New Zealand, and Newfoundland. Registration is not required, but only simultaneous publication within those parts of the empire to which the act applies, publication within fourteen days being deemed simultaneous.

CORN. The United States is preëminently the leading corn country, producing about three-fourths of the world's crop. For the five years 1905-1909 the percentage of the world's crop produced was 76.2, and the exports from the country constitute about one-third of world's exports of corn, averaging during the five years 1906-1910 67,400,000 bushels annually. At the present time corn culture has spread to practically all countries with climatic conditions favoring its growth. The largest corn-producing area outside of the United States is in southern Europe and comprises Austria, Hungary, Rumania, Bulgaria, and other Balkan states, and southwest Russia. This entire region produces over one-half billion bushels annually. In Asia corn culture is mainly practiced in British India, French Indo-China, and the Philippines. The area given to the crop in the

British India about 7,000,000 acres. In Africa, Egypt, and the Union of South Africa are the principal corn-producing countries, the latter exporting annually several million bushels to Europe. Australia and New Zealand do not produce very important crops of corn, which is known there and in South Africa as "mealie."

The corn crop of 1911 was reduced in different parts of the world largely by drouth. The four principal corn-growing countries, the United States, Argentina, Hungary, and Italy, produced about 556,000,000 bushels less than in 1910. All other countries contribute only 14 per cent. of the world's crop. The yields of the four countries mentioned for 1911 and 1910 were respectively as follows: United States, 2,531,488,000 and 2,886,260,000 bushels; Argentina, 27,675,000 and 175,330,000 bushels; Hungary, 137,069,000 and 187,731,000 bushels; and Italy, 93,837,000 and 97,199,000 bushels. In Bulgaria the average yield per acre was over 100 per cent. better than in 1910, and Rumania also had a better average yield than the year before. A more complete list of yields in 1910 and 1911 by countries is given under AGRICULTURE.

The corn crop of the United States in 1911, as a result of a most unfavorable season, was only moderate. A large acreage of unpromising winter wheat plowed up in the spring and planted to corn raised the area to 105,825,000 acres, as compared with 104,035,000 acres the year before. Shortage of moisture early in the season soon after or during corn-planting time, dry weather and hot winds in the summer, and later heavy rains and heavy winds did considerable injury to the crop. The hot winds occurring in the western Mississippi Valley States, when the early fields were tasseling, prevented perfect pollination, and thus interfered with the proper development of the ear. The average yield per acre this year, 23.9 bushels, as compared with 27.7 bushels in 1910, was the lowest since 1901. The average farm value per bushel on December 1, 1911, was 61.8 cents, the highest in the records of the United States Department of Agriculture, with the exception of 1881, when it reached 63.6 cents. The total value of the crop based on this bushel value amounted to \$1,565,258,000, as compared with \$1,384,817,000, the value of the preceding crop. This total value has been exceeded only twice, in 1908 and 1909. The leading corn States in 1911 produced the following amounts: Illinois, 334,950,000 bushels; Iowa, 305,350,000 bushels; Missouri, 192,400,000 bushels; Indiana, 174,600,000 bushels; Nebraska, 155,925,000 bushels; Ohio, 150,540,000 bushels; and Kansas, 126,150,000 bushels. All other States produced less than 100,000,000 bushels each. In acreage Illinois stood first, with 10,150,000 acres, followed by Iowa, with 9,850,000 acres; Kansas, with 8,700,000 acres; Nebraska, with 7,425,000; Missouri, with 7,400,000, and Texas, with 7,300,000 acres.

In comparing the last two census years the Thirteenth Census points out that the area of corn harvested increased from 94,913,873 acres in 1890 to 98,383,033 acres in 1909, a gain of 3.7 per cent. The production of 1909, 2,252,190,000 bushels, was 4.3 per cent. less than in 1899. In 1909 nearly three-fifths of the acreage was in the north central States—21,910,559 acres in Ohio, Indiana, Illinois, Michigan, and Wisconsin, and 35,945,297 acres in Minnesota, Iowa, Missouri, North Dakota, South Dakota, Ne-

braska, and Kansas. In acreage in 1899 Illinois, Iowa, Kansas, Missouri, Nebraska, and Texas, and in 1909 Illinois, Iowa, Kansas, Nebraska, Missouri and Oklahoma, ranked first. In production Illinois, Iowa, Kansas, Nebraska, Missouri, and Indiana ranked first in 1899, and Illinois, Iowa, Indiana, Missouri, Nebraska, and Ohio in 1909.

Much attention continued to be given to the improvement of corn by breeding. Work done by the Connecticut Experiment Station and by the United States Department of Agriculture pointed out the increased vigor of first generation hybrid corn, and suggested its utilization as of importance to the corn-grower. Extension work among farmers to secure larger yields and better grain was carried on vigorously in all the more important corn-growing States. The National Corn Exposition was held in 1911 at Columbus, Ohio.

CORNELL UNIVERSITY. An institution of higher learning at Ithaca, N. Y. The total number of students who received instruction in the university in the year 1910-11 was 5624, an increase of 430 over the enrollment of 1909-10. These were distributed as follows: Graduate Schools, 372; School of Arts and Sciences, 1017; School of Law, 279; School of Medicine, 171; School of Veterinary Medicine, 105; School of Agriculture, 761; School of Architecture, 133; School of Civil Engineering, 558; School of Mechanical and Electrical Engineering, 1073. There were several important changes in the faculty during the year. Prof. Hiram Corson (q. v.) died on June 15, 1911. Another loss was Alexander H. R. Fraser, who for eighteen years had charge of the law library. Dr. Charles S. Bull of the department of ophthalmology died April 17, 1911. The faculty in 1910-11 numbered 507. This included three emeritus professors. Several new buildings were either contemplated or in course of construction during the year. These included a building for the department of domestic science and one for the department of poultry husbandry. A gift of \$300,000 was received from Mrs. Russell Sage for a second hall for women students. The total property of the university on August 1, 1911, amounted to \$15,410,589, and the income from all sources amounted to \$1,769,669. In addition to the gift of Mrs. Sage, as mentioned above, \$60,300 were received from Andrew Carnegie, \$20,000 from Emerson McMillan for enlargement of the campus, and \$25,000 as the first installment from the Goldwin Smith estate. See also GIFTS AND BEQUESTS. For further notes in regard to the work of the university, see UNIVERSITIES AND COLLEGES. The president is Jacob G. Schurman.

CORSON, HIRAM. An American critic, poet and educator, died June 15, 1911. He was born at Germantown, Pa., in 1828. He studied at Tremont University, Norristown, Pa. and in 1850 became librarian of the Smithsonian Institution of Washington, remaining there until

1856. Here he studied the classics extensively. From 1859 to 1865 he was lecturer on English literature in Philadelphia and from 1865 to 1866 was professor of moral science, history, and rhetoric in Girard College. He was professor of the Anglo-Saxon and English languages at St John's College from 1866 to 1870 and from 1870 to 1903 was professor of English literature at Cornell University. From 1903 to the time of his death he was professor emeritus. Professor Corson was one of a distinguished group of men who allied themselves with Cornell University at the time of or shortly after its founding. He was one of the greatest literary critics and scholars identified with that institution. He was a friend of Browning and was recognized as one of the most authoritative interpreters of the latter's work. He was also an authority on Shakespeare and he founded the Corson French prize and the Corson Browning prize at Cornell. He was a voluminous writer. Among his published works are: *The University of the Future* (1875); *The Claims of Literary Culture* (1875); *The Evolution of Shakespeare's Dramatic Blank Verse as a Chronological Test* (1877); *An Introduction to the Study of Robert Browning's Poetry* (1886); *An Introduction to the Study of Shakespeare* (1889); *The Aims of Literary Study* (1895); *The Voice and Spiritual Education* (1896); *An Introduction to the Prose and Poetical Works of John Milton* (1899). He also edited several editions of Latin and English writers. He was a contributor to magazines and reviews on literary and other subjects.

COSTA RICA. A Central American republic south of Nicaragua. Capital, San José.

AREA, POPULATION, ETC. The area is stated at 18,691 square miles. Estimated population (December 31, 1910), 379,538. Chief towns: San José, 29,660 (later estimate, 40,000); Heredia, 7511; Cartago (practically destroyed by earthquake May 4, 1910), 6018; Alajuela, 5861; Limón, 5269; Punta Arenas, 4696. In 1910 immigrants numbered 11,233; emigrants, 7236; births, 15,847; deaths, 9723. Pupils in primary and secondary schools, about 32,000; teachers, over 1000. The state religion is Roman Catholicism.

INDUSTRIES AND COMMERCE. Agriculture is the main source of wealth, and the principal crops are bananas and coffee. Other products include corn, sugar, beans, rice, and cacao.

Imports and exports in 1908: \$5,677,353 and \$7,762,728 respectively; in 1909, \$6,109,938 and \$8,176,257; in 1910, \$7,897,736 and \$8,374,364. The leading imports are cotton textiles, flour, and iron and steel goods. Chief exports in 1909 and 1910: Bananas, \$4,355,045 and \$4,230,238; coffee, \$2,639,873 and \$2,751,024; gold and silver bullion, \$792,847 and \$811,186; cattle hides, \$105,020 and \$125,094; rubber, \$71,756 and \$102,280; timber, \$32,320 and \$78,620; cacao, \$55,765 and \$41,178. Of the imports 55.26 per cent. in 1909 and 55.95 per cent. in 1910 came from the United States; 18.26 and 17.42 from Great Britain; 13.13 and 11.29 from Germany. Of the exports the United States received 58.73 and 60.22 per cent., and Great Britain 36.02 and 35.32, most of the bananas and bullion going to the former and most of the coffee to the latter.

In 1910 there entered the ports (Limón and Punta Arenas) 622 vessels, of 1,227,852 tons.

COMMUNICATIONS. The total railway mileage

at the beginning of 1911 was 627. Railways focussing at Limón, including branches to the banana region and sidings, aggregated 358 miles. The main line connects Limón with San José (103 miles). In October, 1910, a government-owned line was completed, connecting San José with Punta Arenas (69 miles) and thus affording rail communication between Atlantic and Pacific waters. In 1911 telegraph lines were reported at 1473 miles; offices, 109; post offices, 199.

FINANCE. The monetary standard is gold, and the unit of value the colon, worth 46.5 cents. Revenue and expenditure for fiscal years in thousands of colones:

	1906	1907	1908	1909	1910
Revenue	6,211	7,655	7,916	9,281	11,472
Expenditure.....	5,914	7,096	9,191	9,281	8,859

Ordinary revenue in 1909, 7,365,507 colones; in 1910, 8,121,736. Of the latter amount, 4,858,010 colones were derived from customs and 1,931,643 from liquors. The foreign debt, reconstituted in December, 1910, amounted at the end of that year to £1,617,200 (16,922,804 colones); internal debt, 11,051,604 colones; total, 27,974,408 colones. A new foreign loan of 35,000,000 francs was announced in October, 1911.

ARMY. The military force of the republic consisted of a permanent force or peace organization of less than 1000 men and a militia of about 12,000. Nominally, every citizen is liable for service.

GOVERNMENT. The executive authority is vested in a president, elected for four years, and assisted by a cabinet of five members. The congress consists of one chamber of 43 representatives. Both president and representatives are elected for four years by indirect vote. On May 8, 1910, Ricardo Jiménez was inaugurated president, succeeding Cleto González Víquez.

COST OF FOOD. See Food and Nutrition.

COST OF LIVING. See Prices.

COTTON. The cotton crop of 1911 in the United States was estimated by the Secretary of Agriculture in December at 14,885,000 bales of 500 pounds each. During the same month the International Agricultural Institute at Rome estimated the crop for this country at 14,833,000 bales, or 130.3 per cent. of that of the previous year. Although the yield of lint is the greatest in the history of cotton-growing in the United States, the price was below the average of the past two years, and the money value to the producer of the lint and seed was placed at \$775,000,000. On January 1, 1912, there had been ginned 14,332,756 running bales, excluding linters. Of the crop of 1910 on the same date 92.5 per cent. of the total had been ginned. The report for January 1, 1912, includes 106,439 bales of sea-island cotton, produced as follows: Florida, 38,095; Georgia, 63,544; and South Carolina, 4800 bales.

The estimated crop and amount ginned on December 31, 1911, by States was as follows:

State	Estimated crop. 500 pound bales.	Reported ginned. Running bales.
United States	14,885,000	14,332,756
Alabama	1,600,000	1,621,843
Arkansas	915,000	785,499
Florida	73,000	86,435

State	Estimated crop. 500 pound bales.	Reported ginned. Running bales.
Georgia	2,560,000	2,623,604
Louisiana	395,000	353,409
Mississippi	1,195,000	1,047,508
North Carolina ..	935,000	975,809
Oklahoma	915,000	902,562
South Carolina ..	1,480,000	1,509,297
Tennessee	420,000	380,949
Texas	4,280,000	3,935,539
All other States..	117,000	110,302

Of the States listed as "all others," Missouri is estimated as producing 83,000 bales, Virginia 23,000, and California 11,000 bales. In addition some cotton is grown in Arizona, New Mexico, Kansas, and Kentucky.

The total cotton crop of the United States for 1910, according to the United States census returns, was 11,608,618 bales of 500 pounds each, 90,368 bales of sea-island cotton, and 397,628 bales of linters. While the complete figures are not available, it seems probable that the production for 1911 exceeded that of 1910 in every State, with the possible exception of Oklahoma and Mississippi, and later ginning reports may show an increase for these States. The cultivation of sea-island cotton does not seem to be extending in the United States, but the West Indies are gradually increasing their production, and it is believed Porto Rico will again become a producing country. At the agricultural experiment station in Hawaii experiments have demonstrated the possibility of the production of an excellent quality of sea-island cotton. Unlike the practice in other countries, sea-island cotton is grown as a perennial and the trees are pruned annually to get the best results. Similar experiments are in progress with Caravonica cotton, of which some excellent strains have been developed. The serious attack of a bollworm on the cotton in Hawaii has served to check what was believed would be a rapid development in cotton growing.

The cotton production of the world for mill consumption in 1910 was almost 3,000,000 bales more than in the previous year. The contribution of the different countries to the supply for the years 1909 and 1910, according to the United States Census, was as follows:

Country	1910 500-lb. bales	1909 500-lb. bales
Total	19,171,000	16,776,000
United States ..	11,483,000	9,863,000
British India ..	3,508,000	3,733,000
Egypt	1,535,000	911,000
Russia	900,000	720,000
China	725,000	600,000
Brazil	360,000	360,000
Peru	128,000	107,000
Mexico	135,000	125,000
Turkey	105,000	32,000
Persia	92,000	90,000
Other countries.	200,000	195,000

From the foregoing figures it will be seen that the United States contributed 59.9 per cent. of the entire world's supply. The exports of cotton from the United States for the year 1910 were 6,484,429 bales, valued at more than \$460,000,000. The exports for 1911 were probably less in number of bales, but the value was in excess of \$585,000,000, or about one-half of the total agricultural exports of the country. At the same time raw cotton to the value of \$24,776,320 was imported, seventy-eight per cent. of the gross weight coming from Egypt.

FOREIGN COUNTRIES. Data regarding the 1911 cotton crop in foreign lands are rather meagre. That of India is estimated at about 2,476,000 bales, or about twenty per cent. less than the crop of 1910. The Egyptian crop of 1910 was 1,535,000 bales, a record production, but that of 1911 was expected to be much smaller, owing to lateness of the crop and severe injury due to the cotton bollworm. The extension of cotton growing in Africa, although receiving the active support of the governments or semi-official associations of Great Britain, Germany, France, and Belgium, is making very slow progress. Reports from a number of the English colonies show some increase in Nyassaland and Uganda, the 1910-11 crops of which are reported at 4343 and 15,000 bales, respectively. In the German colonies a falling off is noted. Togo, one of the most-favored regions, exported only 1880 bales in 1910, a reduction of 200 bales from the previous year. From German East Africa 2500 bales were exported. In general the African cottons are quoted at a cent or more a pound over American middlings. The extension of cotton cultivation in Africa is meeting with many difficulties. Dunstan, in a report on the present status of cotton cultivation to the international conference on tropical agriculture in Brussels in 1910, summarized the situation, stating that a lack of laborers, the natives preferring to grow foodstuffs, and meagre transportation are serious obstacles to the extension of cotton growing in Africa. The cotton situation in Egypt is far from satisfactory. A constant reduction in the acre yield is reported. Since 1896 the acreage devoted to growing cotton has been increased by about sixty-five per cent., while the total yield in 1909 was only twenty-seven per cent. greater than in 1896. During this period the average yield of lint per acre has fallen from 522 pounds to 388 pounds per acre. A commission is studying the situation and it attributes the depreciation in yield to ravages of insects, soil exhaustion, the use of too much water since the completion of the Assuan Dam, resulting in a water-logged condition of the soil, a lack of careful selection of seed, and the wide adoption of a two-year rotation of crops in place of the three-year rotation previously followed. A new variety of cotton, called from its originator Sakellarides, has appeared in Egypt. It is claimed to be early, of good quality, and has shown considerable immunity to attacks of the cotton worm.

Recent reports show a production of about 1,250,000 bales of cotton in China, and Santo Domingo has entered the list of sea-island cotton producers, with about 275 bales, valued at \$15,000, in 1910. According to consular reports, the first cotton crop in Tamaulipas, Mexico, was produced in 1910, the yield being at the rate of a bale per acre. A Japanese association has been formed to grow cotton in Korea, and in 1911 a crop of 2240 bales was expected from about 1700 acres planted.

Of the so-called by-products of cotton-seed—oil, cake, meal, etc.—the production in 1910 was valued at more than \$142,000,000. The oil manufactured was worth \$80,430,000, and the cotton seed cake and meal \$44,660,000, hulls \$11,370, and linters \$6,250,000. The total production of seed was 5,175,000 tons, of which 4,106,000 were manufactured. The mill value of the seed averaged \$27.40 per ton in 1910.

WORK OF THE UNITED STATES DEPARTMENT OF AGRICULTURE. The work on the standardization of cotton has continued and during the year seventy-nine sets of official cotton grades were sold. At the beginning of the year the New Orleans Exchange was the only one which had formally adopted these official grades as a basis for its operations, but during the year similar action has been taken by the exchanges in Memphis, Galveston, Mobile, Natchez, Little Rock, St. Louis, Charleston, and Macon, with other exchanges considering their adoption. For the permanent preserving of these types for future comparison, sets are especially prepared, placed in vacuum tubes, and stored in vaults. Studies are also in progress relating to some of the ginning problems. Particular attention is given to the diseases of cotton and breeding of disease-resistant forms. During the year in coöperation with the department 2000 bushels of wilt-resistant cotton seed were grown for distribution in the infected regions. Co-operative work on some of the Indian reservations has shown the possibility of growing Egyptian cotton of superior grade on the Pima reservation at Sacaton, Ariz., and some of the more progressive Indians are growing cotton. Yields of more than 500 pounds of lint per acre are reported for the crop of 1911. A large number of special investigations with cotton are in progress. These include breeding experiments, acclimatization, boll-weevil resistance, a study of some of the principles underlying the improvement of staple, earliness, habit of plant, character of seedlings, causes of deterioration in Egyptian cotton, etc. Among the latter it was found that the inferior Hindi cotton was represented in Egyptian cotton, and its greater precocity and vigor explain its continuation even when attempts are made to eliminate it by selection. The farmers' co-operative demonstration work with cotton, corn, etc., is continuing, and during 1911 there were made 10,576 cotton demonstrations. Dr. Seaman Knapp, who was in charge of this work from its beginning, died late in 1910. Experiments were carried on in the summer of 1912 in growing cotton on the Pacific coast from Imperial Valley, Cal., to Klamath Falls, Ore.

BOLL WEEVIL. The spread of the boll weevil has continued eastward as reported by the government and experiment station entomologists. It has advanced practically to the northern limit of cotton growing in Arkansas, to within a few miles of Memphis and to Pollard, in Escambia county, Alabama, thence directly to the gulf, some fifteen counties in southwestern Alabama and two in western Florida being infected. On the other hand, considerable areas of previously infested portions of Texas and Oklahoma were reported as free from boll weevil, the dry and hot summers having destroyed it. On December 5, 1911, a meeting was held at Atlanta, Ga., of the cotton States entomologists, and various plans were recommended for adoption to prevent the spread of the boll weevil into new territory. There was considerable injury reported from various localities due to the cotton worm, and unusual records are reported of the appearance of the adult insects.

MISCELLANEOUS. Secretary Knox, of the United States Department of State, has investigated the question of tare in American cotton, and as a result recommends to cotton

growers and others the standardization of the cotton bale so as to prevent so much loss, a great part of which is not justifiable. At the close of the year 1911 one of the greatest labor troubles in the history of cotton manufacture in England began, and as a result more than 160,000 employees were locked out. A serious disturbance in Massachusetts was reported early in January.

The Eighth International Cotton Congress was held at Barcelona, Spain, May, 1911, with delegates present from every cotton-manufacturing country except Russia and Japan. See **TEXTILE MANUFACTURES.**

CRETE. A Mediterranean island south of Greece; an autonomous state under the suzerainty of Turkey. Area (estimate), 3327 sq. miles. Population (1900), 310,185 (Christians, 269,848; Mussulmans, 33,496; Jews, 728). Canea, the capital, had (1900) 24,537 inhabitants; Candia, 22,774. Imports (1909), 17,477,000 drachmas; exports, 13,373,000. Revenue (1908-9), 5,930,332 drachmas; expenditure, 5,905,980. The debt amounts to 5,317,226 drachmas, advanced chiefly by Great Britain, Russia, France, and Italy at an annual interest and sinking fund of 200,000 drachmas; the service was postponed till 1911. A new loan of 9,300,000 drachmas has been authorized. Crete was administered until 1911 by a high commissioner (nominated by the king of the Hellenes) of the four powers above-mentioned; but upon the retirement of M. Zaimis, who held that post from 1906 to 1911, the powers announced their intention to appoint no successor to the office. Crete is subject to the Porte, though paying no tribute. Gendarmerie and militia are under the direction of Greek officers.

HISTORY. It will be remembered that when Austria-Hungary announced the annexation of Bosnia and Herzegovina in October, 1908, Crete on the same day declared herself a dependency of Greece, but was checked in any further action by the declaration of the four protecting powers that no negotiations would be undertaken with Turkey on that subject unless order were maintained in the island. Popular discontent with the present status and the determination to unite with Greece was manifested at intervals from that time on and continued throughout the present year. The withdrawal of the warships by the four protecting powers in 1909 tended to give free rein to the movement for Greek autonomy. In 1910 the Cretan government provoked a naval demonstration on the part of the four protecting powers by its course in excluding from the Cretan assembly Moslem deputies who had refused to take the oath of allegiance to King George. Early in July of that year four cruisers, one from each of the protecting powers, delivered an ultimatum to the Cretan government saying that they would land troops and seize the customs if the

Moslem deputies were deprived of their salaries for refusing to take the oath. On the following day, July 9, the assembly agreed to admit the Moslem deputies and the powers immediately withdrew their warships. In 1911 the unrest of the Cretans continued to be a disturbing factor in the affairs of the near East. To the request of Turkey that the status of Crete be finally settled, the powers replied in September, 1911, that it was not the proper time to take such action, but that they would not prolong the official tenure of M. Zaimis nor provide for his successor. On October 24 the Cretan government resigned. In November it was reported that the country was in a state of virtual anarchy and an armed outbreak was feared. There were demonstrations by armed men in the interior in favor of union with Greece. To the complaints of the Ottoman government on the subject the powers gave it to be understood that they would reoccupy the island if the movement reached a point that menaced the status quo. The Greek premier declared that on no account would his government be allowed to be involved in a war with Turkey over the Cretan issue. Toward the end of the year the governments of Great Britain, France, and Russia informed the Cretan executive committee of their firm determination to prevent any alteration of the present status quo and to oppose any attempt to send Cretan representatives to the Greek chamber. This tended to restore order in the island. See **ARCHÆOLOGY**.

CRICKET. A feature of the 1911 cricket season was the tour through England and Ireland of the Germantown Cricket Club of Philadelphia. The Americans played thirteen matches during the trip, of which they won five, lost five, and drew three. The British teams defeated were the Mote Cricket Club, Royal Engineers, Mitcham Cricket Club, Blackheath, and the gentlemen of Liverpool. The Americans lost to the Royal Artillery, Free Foresters, Marylebone Cricket Club, Woodbrook Cricket Club, and the Phoenix Cricket Club. The draws were with the Band of Brothers, Gentlemen of Surrey, and Cork County Club. The Toronto Cricket Club in a tour of the United States lost two matches and drew four. The forty-first annual match between the United States and Canada resulted in a draw.

The Staten Island Cricket Club retained the championship of the New York and New Jersey Cricket Association and repeated its 1910 performance by not losing a match. The Staten Islanders also defeated Toronto and the Merion Colts of Philadelphia. The Metropolitan District Cricket League series was won by Kings county in Class A and Bensonhurst in Class B. The University of Pennsylvania won the intercollegiate championship. Haverford was second. Abroad Oxford won its annual match with Cambridge and Harrow lost to Eton.

CRIMINAL LAW. See **PENOLOGY**.

CRIMINALS. See **PENOLOGY**.

CRITCHFIELD, GEORGE W. An American promoter and financier, died April 8, 1911, from wounds received from insurgents in Mexico. He was born in Missouri in 1862. For a time he taught school and conducted a weekly newspaper. At the age of 22 he went to Chicago and became a reporter on the *Chicago Inter Ocean* and later held an editorial position on the *Chicago Tribune*. He removed to New York

City in 1894 and shortly afterward became interested in South American enterprises. He exploited asphalt fields in Venezuela and helped to organize an asphalt company which worked under concessions from President Castro. These concessions permitted the company to carry its products from the asphalt lakes to the coast without payment of export duty. Castro failed to live up to his agreement and practically confiscated the company's property. A claim of \$2,000,000 was filed through the United States government against Venezuela, and this was finally settled for \$450,000. In 1898 Critchfield was an unsuccessful Republican candidate for Congress. He purchased a ranch of 27,000 acres in Mexico and gave up much of his time in prospecting for oil and in the cultivation of chicle. He was engaged in prospecting for oil in the interest of a company of capitalists at the time he was shot.

CRITICISM, LITERARY. See **LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; and GERMAN LITERATURE.**

CROFTS, ERNEST. An English artist and art director, died March 19, 1911. He was born in Yorkshire in 1847 and was educated at Rugby and in Berlin. He studied art in London and Düsseldorf. His first picture was exhibited at the Royal Academy in 1874. It was entitled "A Retreat: Episode of the German-French War." His paintings were chiefly historical and ranged over a wide period. They dealt mainly with military subjects. He was made an associate of the Royal Academy in 1878 and a member in 1896. Up to the time of his death he held the office of keeper of the Royal Academy. His duties included those of chief director of the Art Schools and of chief custodian of the Diploma Gallery and other artistic property of the Academy. Among his well-known paintings are: "Napoleon at Ligny," "Oliver Cromwell at Marston Moor," "The Evening of the Battle of Waterloo," "The Execution of Charles I.," and a fresco of "Queen Elizabeth Opening the First Royal Exchange" at the Royal Exchange.

CRONJE, PIET ARNOLD. A Boer soldier, died February 4, 1911. He was born about 1835 of Huguenot descent, and his first appearance as an important personage was during the insurrection in the Transvaal in December, 1880, when as commandant of the burghers of the southwestern Transvaal, he invested Potchefstroom. He distinguished himself also at Doornkop and at Majuba Hill, where he was second in command in 1881. In 1896 he dispersed the raiders led by Dr. Jameson in the Transvaal after having surrounded them at Doornkop January 2, 1896. On this occasion he showed considerable clemency in guaranteeing the lives of the raiders as a condition of their surrender. At the outbreak of the war against Great Britain in 1899 he was made chief in command of the Boer forces. At that time he was 53 years of age. He was popular with the Boers and his magnetism and stubborn energy made him an effective leader. At the outbreak of the war he was stationed with 6000 troops on the western frontier at Modder River. On November 28 he fought an indecisive battle with Lord Methuen, who was marching with his division to the relief of Kimberley. On December 11 he won a brilliant victory over the same English general at Magersfontein. On the beginning of Lord Roberts's invasion of the Orange Free

State in 1900 Cronje sent a portion of his army to the north and with the remainder sought to oppose the English advance on Pretoria. He was at last surrounded at Paardeberg where he intrenched himself and under a scathing artillery fire sustained that position until the failure of food and ammunition compelled him to surrender with some 4000 troops and six guns on February 27th. After the surrender he was sent as a prisoner of war to St. Helena. He was one of the most sagacious of the Boer leaders and was a member of the Executive Council of the Transvaal. In 1905 he visited the United States and for the remainder of the time until his death he lived quietly on his farm at Klerksdorp.

CROPS, WORLD. See AGRICULTURE.

CROSS COUNTRY RUNNING AND MARATHONS. The senior Metropolitan cross country championship run, the principal event of the kind in the United States, was held at Paterson, N. J. William J. Kramer of the Long Island A. C. for the third successive year was the individual winner, his time for the six miles (about) being 36 minutes 45 seconds. H. Hillawell of the New York A. C. finished second and M. D. Heysman of the Irish-American A. C. third. The team scores were: New York A. C., 26; Irish-American A. C., 65; Mohawk A. C., 73; Long Island A. C., 95; Pastime A. C., 98. In the junior championships held at Hastings-on-the-Hudson Harry McGinn of the New York A. C. was the individual winner. F. Barden of the Yonkers Y. M. C. A. finished second. The Irish-American A. C. was the team winner.

Cornell won the intercollegiate cross-country championship held at Brookline, Mass., on November 25 for the fourth year in succession. J. P. Jones and T. S. Berna of that college for the second consecutive year captured the individual honors by finishing first and second respectively. The score and order at the finish of the colleges entered were: Cornell 48; Harvard, 58; Pennsylvania, 125; Dartmouth 127. The English cross-country championships were held at Taplon, in March. F. N. Hibbins of Thrapston was the winner. He ran the ten miles in 59 minutes 22 2-5 seconds.

Fewer Marathons were run in 1911 than in 1910. The most important was the Yonkers Marathon which was won by J. J. Reynolds of the Irish-American A. C., whose time was 2 hours, 38 minutes 36 2-5 seconds. D. Sheridan of Toronto, Canada, finished second. The Missouri A. C. Marathon held at St. Louis was won by Sydney Hatch of Chicago in the slow time of 3 hours 3 minutes 56 seconds. The twelve-mile race from Fordham to the New York City Hall, held on May 6, attracted a large number of entries. The event was won by Louis Tewanima of the Carlisle Government School, whose time was 1 hour 9 minutes 16 seconds. Frank Masterson of the Mohawk A. C. finished second. The English Marathon went to Harry Green of the Surrey A. C., who ran the distance in 2 hours 46 minutes 29 4-5 seconds. M. Ryan of the Irish-American A. C., New York, was second. See ATHLETICS, TRACK AND FIELD.

CROWELL, EDWARD PAYSON. An American clergyman, scholar, and educator, died March 25, 1911. He was born at Essex, Mass., in

1830 and graduated from Amherst College in 1853. He studied at Andover Theological Seminary, graduating in 1858. In the following year he was licensed as Congregational preacher. Prior to this time he had taught Latin and Greek at the Williston Seminary. From 1855 to 1856 he was tutor in language, and from 1858 to 1864 was professor of Latin and instructor in German. In the latter year he was appointed professor of the Latin language and literature in Amherst College. He held this position until 1908 when he was made professor emeritus. From 1880 to 1894 he was dean of the faculty. For several years he was lecturer on Latin literature at Smith College. He was a member of many learned societies. He edited several Latin texts, including selections from Cicero, Pliny, and the Latin poets. He edited also the *History of the Town of Essex* in 1878. He was a contributor on theological, biographical, and historical subjects to various journals. He compiled the obituary record of graduates of Amherst College for many years. He compiled also a record of the services of graduates and non-graduates of Amherst College in the Union army and navy during the Civil War.

CRUSTACEA. See ZOOLOGY.

CUBA. An island republic of the West Indies. The capital is Havana.

AREA, POPULATION, ETC. The area of the six provinces (including the Isle of Pines, etc.) is 44,164 square miles. The census of September 30, 1907, showed a population of 2,048,980; official estimate of June 30, 1911, 2,223,284, of whom 1,961,896 were natives and 261,388 foreigners. The population, by provinces was: Havana, 576,546; Pinar del Rio, 254,620; Matanzas, 259,841; Santa Clara, 514,325; Camagüey, 135,340; Oriente, 482,612. Immigration in 1909, 31,286; 1910, 32,606 (of whom 28,380 Spanish). Principal cities, with population according to 1907 census and 1910 estimates, include: Havana, 297,159 and 302,526; Santiago de Cuba, 45,470 and 53,614; Matanzas, 36,009 and 64,385; Cienfuegos, 30,100 and 70,416; Camagüey, 29,616 and 66,460; Cárdenas, 24,280 and 28,576. Primary instruction is nominally compulsory. Enrollment in the public schools in February, 1911, 152,658 (average attendance, 105,774); in private schools, 24,434. There are various schools for secondary instruction, and higher and professional education is provided by the University of Havana, which in 1911 had 1274 matriculants.

INDUSTRIES. The staple agricultural products are sugar and tobacco. Other crops are cacao, potatoes and other vegetables, cereals, and fruits, especially pineapples. Reported production of raw sugar: 1899-90, 632,268 tons; 1899-1900, 283,051 tons; 1908-9, 1,521,818 tons; 1909-10, about 1,805,000 tons; 1910-11, over 1,460,000 tons. From sugar cane are also produced large quantities of molasses, aguardiente, and alcohol. Reported tobacco yield (in bales of about 120 lbs.): 1908, 563,059; 1909, 494,358; 1910, 639,508. Livestock, June 30, 1910: 3,098,179 cattle, 572,901 horses, 59,994 mules, 2414 asses. Cuba's mineral wealth is considerable, especially in Oriente, including iron, copper, manganese, lead, zinc, gold, asphalt, and salt. Value of mineral output in 1910, \$4,374,719 (\$3,508,366 in 1909 and \$2,314,900 in 1905). The manufacture of cigars is a very important industry.

COMMERCE. For the calendar year 1909 and

1910, imports of merchandise, \$91,447,581 and \$103,675,581 respectively; exports of merchandise, \$124,711,069 and \$150,909,020. Imports and exports of specie in 1910, \$4,283,617 and \$361,538. Leading imports in 1910: Breadstuffs, \$13,358,362; meats, \$11,476,815; cotton and manufactures, \$8,527,821; machinery, \$8,381,763; iron and steel, \$6,163,754; vegetables, \$4,453,299. Principal exports in 1909 and 1910 respectively: Sugar, \$79,130,181 and \$108,762,632 (\$52,166,812 in 1908); unmanufactured tobacco, \$19,084,704 and \$15,450,943; tobacco manufactures, \$12,900,490 and \$12,423,007; iron and copper ores, \$3,362,289 and \$4,330,476; fruits, \$2,359,397 and \$2,098,089; hides and skins, \$1,482,108 and \$1,894,738; wood, \$1,516,356 and \$1,663,398; molasses, \$1,556,695 and \$1,477,756. Trade by countries for calendar years, in thousands of dollars:

Countries	Imports		Exports	
	1909	1910	1909	1910
United States	46,339	54,569	109,408	129,329
Great Britain	12,260	12,292	5,014	10,696
Spain	8,020	8,680	866	727
Germany	6,588	6,543	4,054	3,646
France	5,308	5,514	1,216	1,549
Other American ..	7,127	8,320	2,661	3,391
Other European ..	3,893	5,532	1,081	915
All other	1,917	2,224	412	655
	91,448	103,676	124,745	150,909

The sugar export to the United States in 1910 amounted to \$102,445,805. Included in the above totals are reexports valued at \$271,471 in 1909 and \$436,651 in 1910.

COMMUNICATIONS. The length of railway in operation at the beginning of 1911 was 3433 kilometers (2133 miles); telegraph lines, 8151 kilometers (5848 miles), with 9952 kilometers (6184 miles) of wire and 171 offices; post offices, 487. When the republic was established in 1902, there were 1792 kilometers of railway in operation; during the administration of Estrada Palma (1902-6), 937 kilometers were opened to traffic; under the American provisional government (1906-9), 396 kilometers; during the administration of General Gómez, to the beginning of 1911, 308 kilometers.

FINANCE. When the American provisional government was superseded on January 28, 1909, by the present Cuban government, there were outstanding obligations of \$11,920,825 and, as relating to the month of January, \$2,023,775; there was in the treasury, \$2,685,229. Receipts to December 31, 1909, \$34,759,204; expenditure, \$36,535,404; balance in treasury, \$939,029. Receipts in 1910, \$41,614,694; expenditure, \$40,593,392; balance, December 31, 1910, \$1,960,331. In 1910, customs yielded \$24,838,030; national lottery, \$3,652,401; loan taxes, \$3,570,177. Total public debt at end of 1910, \$62,083,100 (charges, \$2,464,585).

ARMY. A permanent army, aggregating about 5000, is maintained, which has been organized by officers detailed from the United States army. It is under the direction of a general staff, and includes two regiments of infantry, organized as a brigade, and an artillery division, including two field batteries, four mountain batteries, a machine gun corps of four companies, and a corps of coast artillery. In addition, a rural guard of about 5000 officers and men used for police duty is maintained.

GOVERNMENT. The executive authority is vested in a president, who is elected by indirect vote for four years and is assisted by a cabinet of eight members. The legislative power devolves upon a congress of two houses, the Senate (twenty-four members) and House of Representatives (eighty-three). The president in 1911 was Gen. José Miguel Gómez, who was inaugurated January 28, 1909; vice-president, Alfredo Zayas. Each of the six provinces is administered by a governor who is elected by the people.

HISTORY. The year 1911 was the third year of Cuban independence, the American intervention having come to an end on January 28, 1909, when the American Provisional Governor Magoon, who had held that office since October 13, 1906, turned the administration over to the new executive, President Gómez. The latter had been chosen president in the elections of 1908. Comments on his administration were favorable at first, but during 1910 and 1911 there was an increasing body of criticism. In 1911 as in 1910 there were charges of widespread corruption against the government. These were repeatedly denied. It was said that the reason why they were not generally better known was the fear of United States intervention, which led the government to subsidize the press. It was openly declared that the government bought the silence of the newspapers and even their approval. A prominent English journal in Havana, which was quoted as an authority in the United States, was said to be in receipt of a large monthly sum from the government. The charges against the government may be briefly summarized as follows: That the taxes amounted to as much as thirty per cent.; that the people were ground down under these heavy burdens; that the executive, judicial, and legislative offices were practically sold to the highest bidders; that the public service rights were sold to concessionaries, who asked exorbitant prices; that the natural riches of Cuba were sold in perpetuity by the office-holders. It was said that Gómez, before he became president, had protested against giving the legislature the right of bestowing franchises, and that after Governor Magoon left he had sold to a group of financiers of bad repute all telephone rights for a very low price. Specifically, there were the arsenal and port improvement scandals. As to the arsenal, it was said the government had traded the last piece of land on the water front in Havana for much less valuable land in the interior of the city, resulting in a gain of \$4,000,000 to the concessionaries. The Port Improvement bill increased four-fold the dues in all the ports and provided for a contract with a new company, which gave them all port dues for thirty days in return for certain harbor improvements, as for example dredging, the making of breakwaters, etc., of which the cost was estimated at \$9,000,000. The company also received valuable water fronts in several ports. It was estimated that the company's profits in thirty years would amount to \$50,000,000. Riots occurred in August, owing to the activities of the followers of Acevedo, who had attempted to stir up a revolt in 1910. He accused the present government of corruption and demanded the resignation of the president. The riots, however, were soon suppressed. For an account of the raising of the *Maine*, see the article MAINE.

CULEBRA CUT. See PANAMA CANAL.

CUMBERLAND PRESBYTERIAN CHURCH.

A religious denomination, which was organized in 1810 from a revival in the "Cumberland country" in Kentucky and Tennessee, conducted by Rev. James McCready. The denomination became in the following years of considerable strength in the South. As the result of attempts made at various times for union with the Presbyterian Church of the United States of America, the general assemblies of both churches appointed in 1903 committees on fraternity and union. These held a joint meeting and formulated a basis of union, which was approved by the general assemblies in 1904 and was ratified by the presbyteries of each body in the following year. Considerable opposition arose in the Cumberland Church and a protest was filed against the constitutionality of the assembly's action. Legal measures taken by the members of the Cumberland Church to prevent the union failed, and after the consummation of the union by the general assemblies, the opposition filed a protest and determined to "continue and perpetuate the general assembly of the Cumberland Presbyterian Church as same was constituted and organized on May 7, 1906." This action resulted in prolonged litigation for the possession of the church property. The Supreme courts of Georgia, Kentucky, Texas, Arkansas, Illinois, Indiana, and California favored the union in their decisions, while the Appellate courts of Texas and Indiana and the Supreme courts of Tennessee and Missouri were unfavorable to the union. Most of the courts upholding the union have done so on the ground that a civil court cannot review the decisions of an evangelical court. In February, 1910, the Cumberland Presbyterian Church was given possession of the Cumberland Presbyterian publishing house at Nashville, Tenn., by a decision of the court. During 1911 the Cumberland Church lost in the Supreme Court of Alabama and in the Supreme Court of Mississippi. The most important decisions pending during the year were in the Supreme Court of Oklahoma and in the United States Supreme Court. No satisfactory statistics have been gathered in recent years as to the numerical strength of the church, though it is believed that the communicants number about 100,000 with 721 ordained ministers. In 1906, according to the United States census of religious bodies, the total number of communicants was 195,770 with 2474 churches and 1514 ministers. The next general assembly will convene at Warrensburg, Mo., in May, 1912.

CUNNINGHAM CLAIMS. See ALASKA.

CURAÇAO. A Dutch West Indian colony, composed of the islands of Curaçao (210 sq. miles; 31,406 inhabitants), Bonaire or Buen Ayre (95; 6273), Aruba (69; 8815), St. Martin (17; 3072), St. Eustache (7; 1312), and Saba (5; 1996). The population is that given December 31, 1908; estimate in 1909, for entire colony, 54,580. Imports and exports (1908), 2,811,538 and 874,854 guilders (1 guilder=40.2 cents); 1909, 3,217,000 and 356,000. Vessels entered (1909), 1619, of 2,177,000 cubic meters capacity. Revenue and expenditure (estimate 1911), 677,034 and 1,005,997 guilders respectively, the difference being made up by the home government. Governor, 1911, Dr. Th. I. A. Nuyens.

CURRENCY. See MONEY; paragraph *Bank-nig Reform* under BANKS and BANKING.

CURRENCY ASSOCIATION. See NATIONAL BANKS.

CURTIS, WILLIAM ELLEROY. An American journalist and writer, died October 6, 1911. He was born at Akron, Ohio, in 1850 and graduated from Western Reserve College in 1871. From 1873 to 1887 he was on the staff of the *Chicago Inter Ocean*, and from 1887 to 1901 he was Washington correspondent for the *Chicago Record*, and from 1901 until the time of his death he held the same position on the *Chicago Record-Herald*. In addition to his newspaper work he occupied several public positions. He was at one time special commissioner from the United States to Central and South American republics, and in 1889-90 was executive officer of the International American Conference. He was the first treasurer of the Bureau of American Republics, 1890-1893. In 1892 he acted as commissioner of the Chicago Exposition to Madrid and special envoy to the queen regent of Spain and Pope Leo XIII. For many years previous to his death he traveled extensively and visited nearly every country in the world and contributed letters descriptive of his travels to the *Chicago Record-Herald* and other papers. He was probably the best known American newspaper correspondent. He was a prolific writer and among his published works are *The Life of Zachariah Chandler* (1879); *Children of the Sun* (1882); *Capitals of Spanish America* (1886); *To-day in France and Germany* (1897); *Between the Andes and the Ocean* (1901); *The True Thomas Jefferson* (1901); *The Turk and his Lost Province* (1902); *The True Abraham Lincoln* (1903); *To-day in Syria and Palestine* (1904); *Modern India* (1905); *Egypt, Burma and the British East Indies* (1905), and *One Irish Summer* (1909). He was a member of nearly all the learned societies in the United States and of several in Europe.

CURTISS, GLENN H. See AERONAUTICS.

CURZON-HOWE, Sir ASSHETON GORE. A British admiral, died March 1, 1911. He was born in 1850 the younger son of the first earl of Howe. He entered the navy as a cadet at the age of 13, receiving two and a half years later his commission as lieutenant. In 1879 he was appointed first lieutenant on the *Bacchante* and in this position was responsible for the seamanship instruction of the princes. At the conclusion of his service he was made commander and in 1888 was promoted to captain. He served in the naval brigade, landed under the command of Admiral Fremantle for the punitive expedition against the sultan of Vitu in 1890. Following this service he was appointed Assistant Director of Naval Intelligence and he held his position until 1892, when he was sent to the North American station as captain of the *Oleopatra*. He saw service in Nicaragua and received the thanks of the inhabitants of Bluefields for his action in landing a party of seamen and marines for their protection. It was generally recognized that his prompt action prevented the outbreak of civil war in Nicaragua. Soon after he was appointed flag captain in the *Revenge*. After several other appointments he was, in 1901, promoted to the rank of admiral and saw service in China and in 1906 was promoted to the rank of vice-admiral. He was selected for the post of second in command of the Channel Fleet until February, 1907, when he became commander-in-chief of the Atlantic

Fleet in succession to Sir William May. He held this appointment until 1908 when he succeeded Admiral Sir Charles Drury as commander-in-chief. He was promoted to the rank of admiral in 1909. During his service in command of the Mediterranean Fleet a series of crises occurred, including the revolution in Turkey and the earthquake in Messina in December, 1908. In April, 1910, he was appointed commander-in-chief at Portsmouth.

CUSTOMS FRAUDS. See UNITED STATES, *Customs*.

CYCLING. Frank J. Kramer, of East Orange, N. J., retained his title as professional sprint champion in 1911, although A. J. Clarke made a strong bid for the highest honors. Kramer scored 10 firsts, 3 seconds, and 5 thirds during the season for a total of 67 points. Clarke had to his credit 6 firsts 4 seconds, and 5 thirds for a total of 52. Alfred Gouillet ranked third with a total of 29 points and Joseph A. Fogler fourth with 24 points. E. L. Collins for the second successive year defeated George Wiley for the professional paced title. Collins' score was 147 and Wiley's 97. The amateur championship was again won by Frank Blatz, who made a total of 16 points. Alvin Loftus ranked second with 13 points.

Georges Parent of France for the third year in succession won the world's championship in the professional paced 100 kilometers event, the meeting being held at Rome, Italy. Thorwald Ellegaard of Denmark was the victor in the 1000 meters race. In the amateur contests Leon Meredith of England won the 100 meters event and W. J. Bailey of the same country captured the 1000 meters contest.

The annual six-day race was held in Madison Square Garden, New York City, in December. The winning team was A. J. Clarke and Joseph A. Fogler. Few new important records were established in cycling in 1911.

CYPRUS. A Levantine island, nominally a part of the Ottoman Empire, but occupied by Great Britain. Area, 3584 sq. miles; population (1910), 261,587, exclusive of the military (Mohammedans, 56,586; Christians, 201,682; others, 3319). The census of April 2, 1911, showed a total population of 274,108. Capital, Nicosia, with (1911), 16,052 inhabitants; Larnaca has 9262; Limasol, 10,302. Elementary schools (1909-10), 580, with 29,576 pupils; government aid, £7084. Agricultural production (1909): 1,889,775 bushels wheat, 2,424,550 barley, 382,963 oats, 120,000 vetches. Other cultivated crops are olives, cotton, grapes, carob-beans, linseed, and fruits. Silk, cheese, wool, and hides are also produced for export. Livestock (1909): 67,709 horses, etc.; 62,694 cattle; 315,756 sheep; 31,690 swine; 277,357 goats. Mineral products: Asbestos, copper, gypsum, terra umbra, and marble. Imports (1909), £580,593; exports, £449,950. Tonnage entered and cleared, 785,034. Railways, 61 miles; telegraph lines, 240. Revenue (1909-10), £309,774; expenditure, £251,264; government grant, £50,000; debt, £286,742; annual tribute to the Port, £92,800. British high-commissioner (1911), Major Sir Hamilton John Gould-Adams.

CYRENAICA. See TURCO-ITALIAN WAR.

CYRENE. See ARCHAEOLOGY.

DAHLAK ARCHIPELAGO. See ERITREA.

DAHOMY. A French colony in French West Africa (q. v.). Area, 106,880 sq. kilo-

meters (41,266 sq. miles). Recently estimated population, 851,418 (375 French). Capital, Porto-Novo, with (1909), 25,363 inhabitants. There were (1909) 9 official schools, with 1323 pupils; 21 private, with 2129; 155 Mussulman, with 1558. The principal products are as follows (the values given are for 1909 exports): Palm kernels, 8,123,378 francs; palm oil, 6,448,083; corn, 700,016; live animals, 151,378; copra, 99,420; cotton, 130,078. Total imports and exports (1909), 14,215,996 and 16,350,614 francs respectively. Total railways, 268 kilometers; telegraph lines, 2113 kilometers; telephone lines, 98; number of post and telegraph offices, 25. Revenue in 1909, 3,469,679 francs; expenditure, 3,467,717. Lieutenant-governor (1911), H. Malan.

DAIREN (DALNY). See KWANTUNG.

DAIRY CONGRESS, INTERNATIONAL. See DAIRYING.

DAIRYING. In 1900 dairy cows constituted about one-fourth of the total number of cattle in the United States, but according to the preliminary statement of the Thirteenth Census there has been a constant increase since that time, so that cows now constitute about one-third of the total number. The increase during that period was over twenty per cent., whereas there was a slight decrease in cattle other than dairy cows. The causes of this change were the increase in consumption of milk, the cutting up of large ranges, the increased cost of feeds, which added materially to the cost of raising beef, so that the balance of profit was swung in favor of the milch cow instead of the steer. The State of New York leads in the number of cows, having a total of 1,508,672. Wisconsin is a close second, and Iowa third.

For further statistics on cattle, see AGRICULTURE.

The retail price of milk and its products has continued to advance for several years, but not in proportion to the constantly increasing cost of production. The labor problem, the feed bill, the more stringent regulations governing the production and sale of milk and its products, together with a drought for several successive years in the dairy districts, have contributed to decrease the normal profits of the dairyman. The demand for certified milk is a growing one in all our centres of population, and in spite of its high price it still remains an economical food when compared with the price of meat and many other common articles of diet.

The output of butter in 1911 has enlarged and higher prices have been obtained in the Elgin district than have been recorded for twenty years. As a result of State legislation and official inspection there has been an improvement in the quality of milk each year.

DAIRY SHOWS. Public interest has been aroused by many organizations, such as the National Dairy Show, which held its sixth annual exhibition in Chicago in October, and set a milestone in the progress of the industry. Over 1000 specimens of the leading dairy breeds were shown, and the exhibits of dairy machinery and appliances excelled those of previous years. National, State, and city governments furnished many excellent exhibits in connection with the inspection of milk and milk products. A feature of the show was the attendance of the President of the United States, who gave a brief address, in which he commended the scope of the enterprise and emphasized the importance of the dairy industry.

The students' judging contest attracted much attention, and teams from ten institutions competed. For the first time an International Dairy Show was held at Milwaukee. Among the features were 500 entries of dairy stock, extensive machinery exhibits, a model creamery operated by the dairy division of the Department of Agriculture, a cheese factory fitted up with modern machinery, an interstate butter contest, a demonstration herd showing groups of cattle fed in different ways, a child-welfare exhibit, and many other features of interest to the dairy industry.

The Philadelphia Milk Show, under the lead of the medical men of that city, was perhaps from an educational standpoint the most important exhibition of the kind ever held. Special days were set aside for school children, who visited the show in thousands to witness the picture shows, which illustrated the importance to the welfare of the community of a pure milk supply. The educational exhibits served to portray the conditions relative to the care of cows, the process of milking and the handling of milk on the farm, transportation, distribution of milk, and its uses as a food. The commercial exhibits included those submitted by any individual or company dealing in milk or milk utensils for commercial profit. There were also many meetings of dairymen, scientists, and officials, where problems connected with the industry were discussed.

BREEDING. The circuit breeding with milking Shorthorns at the Minnesota experiment station, conducted in cooperation with the Department of Agriculture, has given such good results in raising the standard of milk and milk fat that similar work has been conducted with Holstein cattle in North Dakota. The general plan of operation is to enlist all cows of desirable conformation and breed, using the yearly records of production as the basis of selection. All cows which do not furnish a profit are discarded, and those finally selected are bred to sires owned by the experiment station. The sires were collected from herds that had been systematically bred and selected for a combination of profitable dairy production and desirable conformation from the beef standpoint. They are the product of dams with yearly records of from 10,000 to 18,000 pounds of milk and combined with this have the ability to lay on flesh when dry and to obtain weights from 1400 to 1600 pounds. All heifer calves from approved dams have been raised and will be tried out in the first lactation period. The bull calves are raised to eight or ten months of age, and divided into three classes, reserved, approved, and rejected. The sires reserved for the circuit are offered for sale to other members of the association for use in supplying new herds taken into the circuit, and those that are approved are sold to the breeders in the usual way.

The dairy industry has been growing rapidly in the Pacific Coast States, where in California alone the output of butter has increased threefold the last ten years. Throughout all the southern United States increased attention is being given to dairying, owing in large part to the efforts of the State and federal departments of agriculture.

SANITARY MILK. Experiments in the production of sanitary milk have been carried on at many of the State experiment stations. The results have thrown a great light on the sources

of the contamination of milk and methods of preventing. A recent report from the West Virginia station shows that the germ content of milk was increased by passing over the milk cooler. A steam-tight compartment to enclose the cooler and bottling machinery was then constructed in the form of a box, with doors convenient to operate. It was found that after turning live steam into the enclosure for fifteen minutes the cooler ceased to become a source of contamination. Sterile water allowed to flow over the cooler contained on an average two bacteria per cubic centimeter, but when the cooler was left open and merely washed and scalded the average number was 11,400 per cubic centimeter. In a number of cases it has been found that the sanitary condition of milk has been improved by offering the dairyman an extra price for his milk, provided it came up to certain requirements. See **SANITATION**.

BUTTER AND CHEESE. An investigation of butter by the Department of Agriculture has shown that twenty parts of metal salt to 1,000,000 of butter distinctly influenced the flavor of butter, copper being more active than iron, and that when oxygen is run through a flask of milk containing metal salts, a strong odor is produced in a short time. These facts lead to the conclusion that the principal changes in storage butter are due to the catalytic action of metallic salts, produced by the acid content of cans, vats, and other containers and inducing an oxidation of some constituent of butter.

In the work with cheese it has been found that cheese without gas holes other than the usual eyes can be made from very gassy milk by inoculating with *Bacillus bulgaricus*. A study of the bacterial flora of imported and domestic Swiss cheese showed that the cheese contained two varieties of the *Bacillus bulgaricus* type. Chemical work in connection with Swiss cheese has established the fact that the first proteolytic change in the ripening of Swiss cheese is the formation of a substance soluble in salt solution.

HOMOGENIZED MILK. Homogenizing milk by treatment which breaks up the fat globules is a new method of treating milk, which seems to be of increasing importance. This subdivision is accomplished in various ways. One method is by forcing the milk by the aid of pumps through a metallic filter and then through capillary tubes. Homogenizing prevents the milk from creaming and it will keep in this condition for a long time. It is used for feeding children, for export, and for making ice-cream. The principal disadvantage perhaps is that it may tempt some unscrupulous dealers to incorporate foreign fats.

VARIOUS EXPERIMENTS. The Wisconsin experiment station has discovered a method by which a palatable cheese can be made from buttermilk, which has about the same food value as lean beef steak and can be produced for half the price. This cheese can be retailed in small packages or shipped in ordinary butter tubs. It can be kept for ten days at a temperature of about 55° F., or for longer periods if stored below the freezing point.

The Commissioner of Internal Revenue has ruled that the incorporation of more than sixteen per cent. of water in butter is not an accident, and such butter is considered adulterated by the federal authorities.

RECORDS. Among the important dairy records made during the year was that of Missouri Chief

Josephine, a cow calved and raised on the farm at the Missouri Agricultural College. She has produced 110.2 pounds of milk in one day, 17,008 pounds in six months, and 28,861 pounds in a year. The amount of solids in one year was equal to six carcasses of a 1250-pound steer. Dolly Dimple, a Guernsey cow, completed a third phenomenal milk record and holds the world's championship for three successive lactation periods. The Holstein cow, Pontiac Pet, made 37.67 pounds of butter in seven days.

FOREIGN COUNTRIES. The dairy industry in Canada has shown a remarkable development in the past few years. In the province of Saskatchewan alone there has been an increase of over 300 per cent. in the output of butter, due to the policy of the government in centralizing the creameries at the most promising point. This has been a difficult year for the dairymen in England, owing to burned up pastures, the small yield of hay, the advanced rates on concentrated feeding stuffs, and more stringent dairy laws. A very thorough clean milk crusade was carried on at Liverpool by means of distributing leaflets on the care of milk to farmers, milk dealers, and consumers, and it is proposed to teach the subject of pure milk in the elementary schools. Owing to the railroad strike the milk trade in England suffered somewhat, but much less than other commodities. Many tons of cheese were lost owing to the delayed market, and in some cases a supply of fresh milk for infants could not be secured.

The French government is encouraging co-operative creameries and cheese factories by granting loans free of interest, the amount to be limited to about twice the paid-up capital and the time limit twenty-five years. Under this system 119 co-operative enterprises have borrowed \$1,000,000 since 1906. The import of French cheese into the United States has increased tenfold since 1900; the principal types imported are Camembert and Roquefort, although Brie and other types are imported to some extent. Investigations of the Department of Agriculture show that probably all these kinds of cheese can be produced in the United States.

A new commercial treaty between Sweden and Germany provides that pasteurized milk and cream may be sent to Germany duty free, while a duty of two cents per pound is applied to butter. Under these conditions the cream export from Denmark and Sweden to Germany is growing rapidly. The new Swedish law provides that all butter exported must be packed in receptacles provided on the outside with a permanent brand or label stating whether or not the butter contains more than sixteen per cent. of water.

In South Africa there has been a great expansion in the dairy industry in several years, and many dairy factories have been established, but the supply of butter has not been sufficient to meet the demand and considerable quantities are still being imported. Dairy interests have been active in New Zealand and the government has been increasing its force for inspecting dairies and herd testing, but its most important work is the grading and classification of butter and cheese for export. The production of condensed and powdered milk is also assuming great importance in New Zealand, both for home consumption and for export. The trade in condensed milk with China has continued to increase. Buyers have found that the condensed

skim milk is much cheaper, so a big trade has started up, but when the consumer realizes the difference between the condensed skim milk and the whole milk it may tend to react on the entire business.

The Fifth International Dairy congress was held in Stockholm in June. Papers on various topics were read by delegates from many countries. Among other things the congress passed a resolution to the effect that one of the best methods for improving milk supplies at practically no cost was the milk record and control associations, which reach their best development in Denmark, but are increasing rapidly in the United States.

The following books on dairying were published during the year: C. H. Eckles, *Dairy Cattle and Milk Production* (New York); Laura Rose, *Farm Dairying* (Chicago); B. Marquart, *Lehrbuch des Milchvieh Kontrollwesens* (Berlin); G. A. Witt, *Die heiztechnischen Winrichtungen der Käseri* (Berlin); H. Weigmann, *Mykologie der Milch* (Leipzig); A. Monvoisin, *Le Lait, son Analyse, et son Utilisation* (Paris).

DAIRY SHOW, NATIONAL.

DALLAS, SEE TEXAS.

DAMON, WILLIAM EMERSON. An American naturalist and author, died December 1, 1911. He was born at Windsor, Vt., in 1838, and was educated at the Kimball Union Academy, Meriden, N. H. He came to New York City and entered the employ of P. T. Barnum as director of the aquarium at Ann Street and Broadway. He had taken a great interest in marine life and botany, and he persuaded Barnum to fit out expeditions to bring fish from Honduras and Bermuda. When this museum was burned in 1866, another aquarium was started at 35th Street and Broadway. Mr. Damon had much to do with the opening of the great public aquarium now in New York City. He was also a collector of shells. He wrote a work entitled *Ocean Shells*. For many years he was connected with the firm of Tiffany and Co. He was a member of several learned and scientific societies.

DAMBOSCH, WALTER. See MUSIC.

DAMS. During 1911 the failure of several large dams, attended in one case by great loss of life and property, aroused general attention to the condition of such works in the United States and the need of proper State supervision of their design, construction, and maintenance.

AUSTIN DAM FAILURE. The most serious of these disasters, involving as it did a loss of life of eighty-five persons, was the collapse of the concrete dam of the Bayless Pulp and Paper Co. on Freeman's Run just above the village of Austin, Pa. The water thus released swept down the narrow valley in which the villages of Austin and Costello, one and one-half and three miles respectively below the dam, were located, carrying death and destruction in its course. Previously, on January 23, 1910, this dam had failed to withstand a flood that while doing serious damage to the structure and leaving it seriously impaired, nevertheless had not been attended by disastrous results. It was a reinforced concrete structure crossing the valley where it was about 350 feet in width, and was designed to impound 200,000,000 gallons of water, having a depth of forty-two feet to the level of the spillway, with two and one-half feet free board. The concrete structure, which was thirty feet in

width at the bottom, and two feet five inches at the top, was founded on a solid stratum. The dam which was 554 feet in length on top was built of cyclopean concrete in which large quarry stones were embedded. It was built below an older dam so as to increase the volume of water impounded, and was begun in May and finished about December 1, 1909. On January 22, 1910, part of the earthwork below the dam was carried away and water was found coming from behind and under the dam. On the following day the middle section slid out at the bottom eighteen inches, and at the top about thirty-one inches, while cracks developed on the down-stream face. The dam continued to overflow, but the movement ceased and the pressure was relieved by blasting out a section of the dam on the west side and finally emptying the dam.

While some radical recommendations for strengthening the structure and cutting off percolation were made, nothing but temporary repairs were made, and in this condition the dam remained until September 30, when full to overflowing from the heavy rains the entire structure collapsed, four-fifths of the entire length being broken into seven large fragments, most of which remained vertical.

The breaking of the concrete structure was complete. The two largest fragments near the middle of the dam were shifted fifteen to twenty-five feet down stream. It was but the continuation of the slipping of January, 1911. In fact, this was the conclusion reached at the coroner's inquest, when with the assistance of expert engineering witnesses the design, construction, and failure of the dam were investigated with great care. It was found "that the failure of this dam was due to sliding of the concrete structure on its foundation, as a result of faulty foundation, faulty design, faulty construction, and faulty operation." The indictment of the officers of the paper company followed.

FAILURE OF BLACK RIVER DAMS. A failure occurred in October on the Black River in Wisconsin, involving the carrying away of embankments which formed in part the Hatfield and the Dells reservoirs. This failure involved in either case the earthen embankments, or side walls, which formed the boundary of the reservoirs, and the flow of the river was carried around instead of over the spillway as designed. The failure of the upper dam was responsible for the breaking of the lower dam embankment and was due to abnormal rains by which the river and reservoirs were swollen; the waters level in the lower lakes raising above the dikes on either side. The Hatfield dam, which formed a reservoir with an area of 9000, acre feet consisted of a central or concrete spillway section 490 feet long, with a maximum height of forty feet, at each end of which were heavy abutments and earthen dikes. It was built in 1907-8. The embankment on the west side was about 4000 feet long, but very low for most of its length. Only about 150 feet of this dike were washed away. The east dike had a top width of sixteen feet and was 1150 feet long, with a maximum height of twenty-six feet, its crest being twelve feet above the crest of the dam. Extending down-stream from the dam about 500 feet of the portion adjacent to the track was washed away and a crevasse formed. Some four miles above

the Hatfield dam was a larger reservoir known as the Dells and built in 1910. It was formed by a masonry dam 260 feet long of the same type of cross section and provided with a dike at the west end. The maximum height was thirty feet, and it impounded 11,000 acre feet of water. The dike of this reservoir was six feet higher than the crest of the dam. The most serious result of the failure of these Black River reservoirs occurred at Black River Falls, where the business portion of the town was almost completely destroyed by the flood stream which was backed up by a massive concrete dam that remained intact.

MOVABLE WICKET DAM. On July 25, 1911, was opened for service the largest movable wicket dam in the world, on the Ohio River near Cincinnati, after having been under construction some six years at a cost of \$1,500,000. It is built entirely of concrete and steel, 60,000 cubic feet of the former material being used in the construction. It is known as Dam No. 37, or the Fernbank dam, and was to be used as a type of construction in the Ohio River in making that stream navigable the entire year from Pittsburgh to Cairo. The dam consists of a series of movable hinged wickets mounted in a long line on the river bed. When the river is high and there is no need of maintaining an artificial stage of water, the wickets are moved back flat on the bed of the river and boats pass freely over them. When, however, the river is low, these wickets are raised so as to impound the water above the dam, and boats must pass through the locks.

KEOKUK DAM. During the year an important dam across the Mississippi River between Keokuk, Iowa, and Hamilton, Ill., was in course of construction at the Des Moines rapids. This dam was built to raise the water level thirty-five feet, and supply power for a hydro-electric plant with a capacity of 300,000 horsepower. The main dam is 4570 feet in length from one shore to the power house, on the Keokuk side, which is parallel with that shore, and extends for 1700 feet in length. There is a lock for the river steamers between this power house and the shore and also the forebay. The dam is of the bridge type, thirty-five feet in height, with arches of thirty feet span between piers six feet wide. The arches are filled with concrete to twenty feet below the crown, and steel gates sliding vertically on the face of the bridge close the upper space of each arch. In the power house will be located fifteen turbines each direct-connected to a 7500 kilowatt generator. These generating units are ranged in line in the power house and space was left for thirty eventually.

HAUSER LAKE DAM. A notable concrete dam was built eighteen miles below Helena, Mont., across the upper Missouri River, taking the place of a steel frame structure on a concrete base which failed April 14, 1908. This new dam provided power for a large hydro-electric station. It was completed on May 21, 1911, and its construction was attended by many extraordinary difficulties, as new problems were continuously presented to the engineers. The dam itself is of the gravity type, and contains 85,000 cubic yards of concrete. It is 490 feet long, 132 feet high at the deepest part, and eighty-five feet thick at the base. The early construction was made unusually difficult owing to the wreckage of the former steel struc-

ture, which was entangled in the boulders at the dam site. See also **AQUEDUCTS, PANAMA CANAL, and WATER SUPPLY**; and, for Roosevelt Dam, **ARIZONA**.

DANA'S OPERATION. See **RHIZOTOMY**.

DANBURY HATTERS' CASE. See **BOYCOTT**.

DANDY, GEORGE BROWN. An American soldier, died January 14, 1911. He was born at Macon, Ga. in 1830, and was educated in private schools in New Jersey, to which State his family had removed when he was still young. In 1847 he enlisted for the Mexican War and served until its close. He began the study of medicine, but left it to enter the United States Military Academy, from which he graduated in 1852. At the beginning of the Civil War he was first lieutenant in the Third Artillery. He was made colonel of the 100th New York Infantry in 1862, and in 1865 was brevetted brigadier-general for services in the field. He was honorably mustered out of volunteer service in 1865. In 1875 he was appointed major and quartermaster-general in the regular service, lieutenant-governor in 1887, and was retired in 1894. He was advanced to the rank of colonel, retired, by the act of April 23, 1904. He served in several expeditions against the Indians in the west. He built Ft. Phil Kearney at the base of the Big Horn Mountains in 1866, and Ft. Abraham Lincoln, North Dakota, in 1873-75.

DANGEROUS TRADES. See **CHILD LABOR**.

DANISH WEST INDIES. A Danish colony composed of three West Indian islands: St. Croix (84 sq. miles; population in 1911, 15,467); St. Thomas (33; 10,678); St. John (21; 941). Sugar cane, cultivated by the free negroes who form the majority of the population, is the principal product. Trade with Great Britain in 1908: imports £202,673, exports £212,147; with Denmark, £55 and £1800. Governor (1911), P. C. Limpricht.

DARTMOUTH COLLEGE. An institution of higher learning at Hanover, N. H., founded in 1769. The students enrolled in the various departments in 1910-11 were 1306. The faculty numbered 112. During the year the faculty lost by death one member, and by resignation eleven. There were appointed twenty-eight new members in the faculty. The most notable benefaction received during the year was the Edward Tuck gift of \$400,000 to apply to the improvement of the existing scale of salaries of the faculty of the college. A new building, known as the Parkhurst administration building, was erected during the year. The productive funds of the college amount to \$3,500,000 and the income to about \$380,000. The library contains about 100,000 volumes. The president is Ernest Fox Nichols, LL. D.

DATE INDUSTRY. See **HORTICULTURE**.

DAVIDSON, GEORGE. An American geodist, astronomer, and educator, died December 1, 1911. He was born in Nottingham, England, in 1825. In 1832 his parents removed to the United States and he was educated in the public and high schools of Philadelphia, studying afterwards at Santa Clara College and the University of Pennsylvania. From 1845 to 1895 he was a member of the United States Coast and Geodetic Survey. He was engaged in geodetic field and astronomical work in the Eastern States from 1845 to 1850 and from 1850 to 1895 in the coast survey work of California,

Oregon, Washington, and Alaska. After serving as honorary professor of geodesy and astronomy at the University of California he was, in 1898, made professor of geography in that institution. He served as expert at the United States Mint at Philadelphia and San Francisco in 1872, 1885 and 1886. In 1873-4 he was a member of the United States Irrigation Commission which made investigations in India, Egypt, and other countries. He was a member of the United States Advisory Board of Harbor Improvement at San Francisco from 1873 to 1876. In 1874 he was in charge of the Transit of Venus Expedition to Japan and in 1882 headed an astronomical expedition to New Mexico. From 1888 to 1890 he was a member of the Mississippi River Commission. He served as special agent of the United States at the Ninth International Geodetic Congress at Paris in 1889. He was a member of many learned and scientific societies, both American and foreign. He published over 260 papers and volumes on astronomy, engineering, navigation, and geography.

DAVIDSON, RANDALL THOMAS. See **LITERATURE, ENGLISH and AMERICAN, Religion**.

DAVIES DIRECT PRIMARY LAW. See **MAINE**.

DAVIS, R. H. See **LITERATURE, ENGLISH and AMERICAN, Fiction**.

DAVIS, ROBERT. An American political leader, died January 9, 1911. He was born in County Carlow, Ireland, in 1848, one of eleven children. In the same year he was brought to the United States by his mother. He attended the common schools, but upon the death of his father in 1858 was obliged to leave school to assist his mother. As soon as he had become of age, he entered politics. He served in several minor offices and in 1886 was elected sheriff of Hudson county, N. J. This office carried with it great powers and during his term Davis established the foundation of his future leadership. He increased his popularity by the methods common to political leaders of his type and in 1892 became the undisputed leader of the Democratic party in Jersey City and one of the powers in Democratic politics in the State. His candidates were defeated in 1901, but he returned to power in 1907 with the election of his candidate for mayor. Through his connection with politics he amassed a large fortune. He supported Woodrow Wilson for governor of the State in 1910 and to him was largely given the credit for Dr. Wilson's election.

DELAWARE, POPULATION. The Thirteenth Census, taken in 1910, showed a population in the State of 202,322 as compared with 184,735 in 1900, a gain in the decade of 9.5 per cent. The only large city in the State is Wilmington, with a population in 1910 of 87,411 as compared with 76,508 in 1900. The capital is Dover which had in 1910 a population of 3720, as compared with 3229 in 1900.

AGRICULTURE. The Thirteenth Census, taken in 1910, includes the statistics of agriculture in the various States. The information gathered is of date April 15, 1910. At that time there were in the State 10,836 farms,

as compared with 9687 in 1900. The land area in farms was 1,038,806 acres, with improved land amounting to 713,538 acres. The average acreage of farms was 95.9. The total value of farm property in the State was \$63,179,201 as compared with a value of \$40,697,654 in 1900. Of the total number of farms 6301 were operated by owners and managers and 4535 by tenants. The farms free of mortgage numbered 3817 and those mortgaged numbered 2264. Interesting statistics were gathered in regard to the nativity of farmers. It was shown that the native white farmers of the State numbered 9504, the foreign-born white farmers, 410, and the negro and other non-white, 922. The total value of domestic animals and poultry on the farms of the State in 1910 was \$6,817,123 as compared with a value of \$4,111,054 in 1900, an increase of 65.8 per cent. The cattle numbered 3,451,791; mules, 764,133; swine, 337,910; sheep and lambs, 36,898. The total number of fowls of all varieties was 876,081, valued at \$560,146.

The following table gives the acreage, production, and value of the various crops in 1910 and 1911.

	Acreage	Prod., bu.	Value
Corn1911	195,000	6,830,000	\$4,044,000
.....1910	193,000	6,137,000	3,191,000
Wheat1911	113,000	1,887,000	1,698,000
.....1910	116,000	1,972,000	1,775,000
Oats1911	4,000	120,000	56,000
.....1910	4,000	135,000	58,000
Rye1911	1,000	15,000	14,000
.....1910	1,000	16,000	11,000
Potatoes...1911	11,000	660,000	634,000
.....1910	11,000	1,133,000	680,000
Hay1911	72,000	a 63,000	1,418,000
.....1910	77,000	110,000	1,628,000

a Tons.

MINERAL PRODUCTION. The State does not produce a large amount of minerals. The total value of the mineral products in 1910 was \$664,073 as compared with \$876,501 in 1909. The most valuable product was stone, \$357,708. The clay products were valued at \$216,555. Other minerals produced were sand, lime, brick, and mineral waters.

MANUFACTURES. The Thirteenth Census included statistics for the manufacturing industries of the State. These are for the calendar year 1909 and the general results will be found in the table below. The largest number of men employed in any single industry are those engaged in the tanning of leather. These numbered 3045. The manufacture of foundry and machine shop products gave employment to 2210 wage earners; the paper and wood pulp industry to 1525; canning and preserving to 1369; shipbuilding to 1239, and lumber and timber production to 1174. These are the only industries giving employment to more than 1000 men, with the exception of those employed by the railroads in the car shops and elsewhere, who numbered 2210. Of all the persons engaged in the manufacturing industries of the State, 5.8 per cent. were officials, 5.7 per cent. clerks and 88.6 per cent. wage earners. Of the clerks employed, 81.8 per cent. were male and 18.2 were female, and of the wage earners, 82.4 per cent. were male and 17.6 per cent. were female. Of the total number employed 97.5 per cent. were

sixteen years old and over, and 2.5 per cent. were under sixteen. The largest number of women and children are employed in the canning and preserving industry. For the great majority of the wage earners employed in the manufacturing industries of the State the prevailing hours of labor range from fifty-four to sixty hours per week, or from nine to ten hours a day, only eight per cent. of the total being employed in establishments working less than nine hours a day, and only 4.5 per cent being employed in establishments working more than ten hours a day.

The following table gives a summary of the results of the census for the calendar years 1909 and 1904.

	Number or amount 1909	1904
Number of establishments.	726	631
Persons engaged in manufactures	23,984	20,567
Proprietors and firm members	722	641
Salaried employees	2,024	1,451
Wage earners (average number)	21,238	18,475
Primary horsepower	52,779	49,490
Capital	\$60,906,000	\$50,926,000
Expenses	46,958,000	37,362,000
Services	12,618,000	9,787,000
Salaries	2,322,000	1,629,000
Wages	10,296,000	8,158,000
Materials	30,938,000	24,884,000
Miscellaneous	3,402,000	2,691,000
Value of products	52,840,000	41,160,000
Value added by manufacture (value of products less cost of materials)...	21,902,000	16,276,000

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the Delaware Hospital in Wilmington, the Delaware State Hospital at Farnhurst, the Home for Aged Women of the County of New Castle at Wilmington. Important work is also carried on by the People's Settlement Association, which during the year was engaged in an effort to raise funds for a building to cost \$50,000. An effort is on foot to establish a State board of charities or some official supervision of charitable and correctional institutions. Such institutions are at the present time carried on through private auspices. On December 6 and 7 a State conference of charities was held to consider this and other questions. Through the associated charities of Wilmington a loan association was organized during the year, with a capital of \$10,000. Loans of five or ten dollars will be made for small business enterprises to encourage thrift, industry, and self-dependence. The city of Wilmington appropriated \$250,000 for park extension, including five playgrounds under municipal control and three under private management.

FINANCES. The report of the State treasurer shows receipts for the fiscal year 1911 from the general fund of \$629,312, from the school fund, \$174,115, and from the sinking fund \$12,805. The expenditures from the general fund were \$659,691, from the school fund \$174,490, and from the sinking fund \$12,989. The assets in excess of all liabilities at the close of the fiscal year were \$1,041,638. The principal sources of revenue for the general fund were from railroads, licenses, insurance companies, and banks.

The principal expenditures were for State departments, education, charities and corrections, public health, and highways. The school fund is divided among the public schools of the State. The sinking fund is made up by the receipts from the rental of oyster grounds and the licenses of the oyster beds, and the income from investments held by this fund. The bonded indebtedness of the State at the close of the fiscal year was \$826,785.

POLITICS AND GOVERNMENT

The legislature met in 1911 and passed several important measures. These are noted in the paragraph *Legislation*, below. As the term of Senator Henry A. Du Pont expired in 1911, it was necessary to choose his successor. A deadlock in the Senate, brought about largely through the efforts of State Senator Louis A. Drexler, prevented a choice of senator until several weeks had elapsed. Senator Drexler, on January 3, prevented the Senate from reorganizing by the employment of dilatory tactics. He gave as a reason for this that the Republican leaders had failed to elect him president *pro tempore* although they had promised to do so. After considerable delay the House and Senate were organized, and after many ballots Senator Du Pont was reelected after having been made the nominee of the Republican caucus on June 16.

The first factory inspection bill proposed in the State was introduced into the legislature. This provided not for general inspection, but for proper sanitary conditions, safe fire exits, and limited working hours for women employees. It provided also for a woman factory inspector and two unpaid assistants, all of whom were to be appointed by the Superior Court. In its passage through the legislature the bill was amended to apply to the telephone, restaurant, laundry, and candy business and also to the retail merchants and canneries. The bill passed both houses by unanimous vote, but in spite of protest of organizations formed to support it, Governor Pennewill allowed the thirty days after the adjournment to pass without his signature, thus bringing about the defeat of the measure.

On June 21, Judge Lanning of the United States Circuit Court ordered the dissolution of the so-called powder trust. There were no State elections held during the year.

LEGISLATION. The only important measures passed at the legislative session of 1911 include the following: Provision for the preparation and adoption of a new legal code; a uniform negotiable securities act; the establishment of a commission to form a child labor law and an employers' liability law.

STATE OFFICERS: Governor, Simeon S. Pennewill; Lieutenant-Governor, John M. Mendinghall; Secretary of State, Charles S. Richards; Treasurer, David O. Moore; Auditor, Theodore Townsend; Attorney-General, Andrew C. Gray; Commissioner of Insurance, Charles H. Maull; Commissioner of Agriculture, Oliver A. Newton—all Republicans, except Gray, Democrat.

JUDICIARY. Supreme Court: Chancellor, Charles M. Curtis, Republican; Chief Justice, James Pennewill, Republican; Associate Justices, Henry C. Conrad, Republican; Victor B. Woolley, Democrat; Herbert L. Rice, Republi-

can; William H. Boyce, Democrat; Clerk, Charles H. Le Fevre, Democrat.

STATE LEGISLATURE, 1911. Republicans, Senate, 9; House, 22; joint ballot, 31; Democrats, Senate 8; House, 13; joint ballot, 21. Majority, Senate, Republicans, 1; House, Republicans, 9; joint ballot, Republicans, 10. The representatives in Congress will be found in the article UNITED STATES, section *Congress*.

DENMARK. A constitutional monarchy of northern Europe. Capital, Copenhagen.

AREA, POPULATION, ETC. Area, 38,985 sq. kilometers (15,052 sq. miles). Population with the Faeroes (1908), 2,605,268 (977,808 engaged in agriculture and forestry, 801,916 in business and industry, 247,130 in commerce, etc.). Census of February 1, 1911, returns a total population of 2,775,076 (1,346,869 males and 1,428,207 females). Copenhagen had (1911), 462,161 inhabitants (suburbs inclusive, 559,398); Aarhus, 61,755; Odense, 42,137; Aalborg, 33,449; Horsens, 23,843; Randers, 22,970; Reykjavik (Iceland), 11,593. Marriages (1910), 19,986; births, 77,080; deaths, 36,970; emigrants, 8890.

Elementary schools (1909), 3413, with 363,661 pupils. The secondary schools have an average annual attendance of 55,000. The University of Copenhagen has 95 instructors and about 2000 students. Primary education is free and compulsory. The Lutheran is the state religion; complete religious liberty prevails.

INDUSTRIES AND COMMERCE. The area (in hectares) sown to principal crops and the yield (in quintals) in 1910 and 1911 (preliminary), with yield per hectare in 1910, are shown below:

	Hectares		Quintals	
	1910	1911	1910	1911 per ha.
Wheat ..	42,000	42,000	1,238,187	1,287,683 29.4
Rye	275,000	275,000	5,079,627	5,011,427 18.5
Barley ..	233,000	233,000	5,198,669	5,367,988 23.3
Oats	403,000	403,000	7,197,998	7,889,786 17.9
Beets	23,000	24,900	7,384,795	6,941,707 321.1

Livestock (1909): 534,680 horses, 2,243,889 cattle, 726,027 sheep, 1,466,932 swine, and (1903) 38,984 goats. Sugar mills (1909), 7; production, 62,760 tons of beet sugar. Margarine and oleomargarine factories, 19; production, 30,310 tons. Distilleries, 29; brandy output (100°), 14,762,927 liters. Excisable beer produced, 22,447,859 gallons. Fisheries products, £674,698.

The general and special trade for three years is given in kroner as follows:

	1908	1909	1910
Imports, gen....	711,608,000	725,037,000
" spec....	550,739,000	566,782,000	570,000,000
Exports, gen....	616,943,000	608,081,000
" spec....	439,518,000	443,822,000	480,000,000

Details of the special trade for 1909 are as follows:

Imports	1000 kr.	Exports	1000 kr.
Cereals	94,854	Butter	180,301
Oilcake	57,227	Meats	119,134
Coal	44,337	Animals	42,051
Ironwares	27,337	Eggs	26,121
Timber	19,581	Hides	14,559
Woolens	17,195	Fish	6,953
Other textiles ..	17,117	Ironwares	5,942
Hides	10,094	Barley	3,978
Coffee	10,020	Ships	3,900

Principal countries of origin and destination (1909), general trade; Germany, imports 253,039,000 kroner and exports 133,051,000; Great Britain, 113,502,000 and 329,567,000; United States, 86,196,000 and 31,126,000; Russia, 82,248,000 and 29,838,000; Sweden, 58,274,000 and 39,542,000; Netherlands, 23,094,000 and 2,099,000; France, 16,264,000 and 1,026,000; Norway, 10,674,000 and 18,600,000; Belgium, 10,417,000 and 1,981,000.

Shipping (1910): 34,588 vessels, of 3,782,165 tons, entered; 34,447, of 1,357,785, cleared; 95,470 coasting vessels, of 1,745,533 tons, entered and 95,052, of 1,734,879, cleared. Merchant marine (December 31, 1910): 3648 vessels of 521,451 registered tons (1397, of 420,829 tons, steamers).

COMMUNICATIONS. Length of railways in operation (end of 1909), 3403 kilometers. Cost of construction to March 31, 1910, 250,318,835 kroner. State telegraph wires (March 31, 1911), 12,842 kilometers; offices, 172. Telephone wires, 25,368 kilometers. Post offices, 1086.

ARMY. Military service in Denmark is obligatory on all able-bodied men who have attained the age of twenty-two, liability for service being eight years in the first line of the army and eight years in the second. In 1911 the contingent of recruits was 8000 for the infantry, 600 for the cavalry, 1600 for the artillery, and 300 for the engineers. These recruits serve 165 days in the infantry, one year in the artillery, thirteen months with the technical troops, so that a force of 11,000 men with the colors is maintained. The organization in 1911, in accordance with the plans of reorganization adopted in 1909, consisted of 52 battalions of infantry, 31 in the line and 21 in reserve, instead of 44 as in the old organization; 12 squadrons of cavalry, instead of 15, 24 field batteries instead of 16, 18 coast batteries, 12 in the line and 6 in reserve, and 12 companies of engineers in place of 9. The military defense scheme provided for the strengthening of the sea and coast defenses at Copenhagen, and the erection of new forts, the land defenses remaining in their present condition awaiting later developments. The military strength in 1911 was estimated at 830 officers and 13,000 men on a peace footing, and 1250 officers and 50,000 men on a war basis. With the complete execution of the military scheme the force available on mobilization should amount to 83,000 men, of which 58,500 would be infantry, 5000 cavalry, 6800 field artillery, and 8600 fortress artillery, or a total effective of about 70,000. A decree of August 17, 1911, provided for the command of the army in time of war or mobilization in accordance with the reorganization law of September 30, 1909. By this decree the general commanding the section to the east of the Grand Belt receives the title of general-in-chief in time of war, and has charge of the defense of the main-

land, and especially of the defense of Copenhagen. The general commanding the second division directs operations to the west of the Grand Belt in accordance with the general plan of the commander-in-chief. Detailed provision was made for the organization of the staff, and for the responsibility of the various officers of the army and navy, the sea defenses in Denmark being centralized under the minister of defense, together with the army.

FINANCE. The unit of value is the krone, worth 26.8 cents. Revenue and expenditure for three years are given in kroner:

	1908-9	1909-10	1910-11
Revenue	93,359,181	135,248,843	142,102,605
Expenditure	107,996,089	133,179,461	139,161,744

The budget for 1911-12 is estimated as follows: Revenue, 95,491,250 kroner (indirect taxes, 58,552,600; direct taxes, 18,879,100; receipts from capital, 6,468,989; interest, etc., 4,917,144; lottery, 1,540,000; posts and telegraphs, 1,260,160; domains, 1,037,589). Expenditure, 116,894,771 kroner (war, 22,420,295; railways, etc., 13,375,554; interior, 13,263,482; navy, 11,273,096; debt, 9,427,270; justice, 8,904,360; finance, 7,427,204; agriculture, 5,228,224; pensions, 4,996,100; public works, 3,161,907; civil list, etc., 1,155,200; foreign affairs, 973,925; Rigsdag and Council of State, 936,918; commerce and navigation, 574,131. The public debt stood, March 31, 1911, at 335,860,002 kroner.

GOVERNMENT. The executive authority is vested in a king, aided by responsible ministers; the legislative, in the Rigsdag (composed of the Landsting and the Folkething). Frederick VIII., born June 3, 1843, married (1869) to Princess Louisa of Sweden and Norway, succeeded to the throne January 29, 1906. Heir-apparent, Prince Christian, born September 26, 1870. The ministry, constituted July 5, 1910, was in 1911 as follows: President of the Council and Minister of War and Marine, K. Berntsen; Foreign Affairs, C. W. Count of Ahlefeldt-Laurvig; Agriculture, A. Nielsen; Worship and Instruction, J. Appel; Public Works, T. Larsen; Interior, J. Jensen-Sønderup; Finance, N. T. Neergaard; Commerce and Navigation, O. H. V. B. Muus; Justice, F. T. von Bülow; Minister for Iceland, Bjorn Jonsson.

DENSMORE, EMMET. An American physician and inventor, died in February, 1911. He was born in Blooming Valley, Pa., in 1857, and was educated at the Allegheny College and in medicine at the University Medical College of New York University, from which institution he graduated in 1885. He was associated with his brothers in the development and production of petroleum at Oil Creek, Pa., from 1861 to 1864. He was the inventor of the first tank cars by which oil was shipped to seaboard. He was associated with his brother James in developing the first successful typewriter invented by C. Latham Sholes and afterwards known as the Remington. He afterwards cooperated with his brother, Amos, in the development of the Densmore typewriter. He was the author of *How Nature Cures*; *Sex Equality*; and *Introduction to the Arcana of Nature*.

DENVER. See COLORADO, and MUNICIPAL REFORM.

DE PAUW UNIVERSITY. An institution of higher learning, founded in 1837 at Greencastle, Indiana. The number of students enrolled in the various departments of the university in 1910-11 was as follows: Asbury College of Liberal Arts, 655; Music and Art Academy, 85. The faculty numbered 40 in the College of Liberal Arts, 12 in the College of Music, 3 in the department of art, and 16 in the academy. During the year Professor Henry Boyer Longden was given a year's absence for study in Germany. Several additions were made to the faculty. An effort is being made to increase the endowment of the university, and it is meeting with great success. The general education board has offered to give \$100,000 on condition of an additional \$400,000 being raised. It was expected that this addition would be completed by December 31, 1911. The productive funds of the university amount to \$576,694 and the income to \$78,881. The library contains about 35,000 volumes. The president is F. J. McConnell, LL. D.

DEVINS, JOHN BANCROFT. An American clergyman and editor, died August 26, 1911. He was born in Brooklyn in 1856 and graduated from New York University in 1882. In 1888 he was ordained to the Presbyterian ministry and was pastor of churches in New York City from that year until 1905. Previous to his ordination he had done journalistic work and was a member of the staff of the New York *Tribune* from 1880 to 1888. From 1890 to the time of his death he was managing editor of the New York *Observer*. He organized many social and philanthropic societies, among them the Federation of East Side Workers and the New York Employment Society. He was a member of many commissions for religious and social work. He was the author of *The Church and the City Problem* (1895) and *An Observer in the Philippines* (1905). He also wrote several well-known hymns and assisted in the preparation of the *Life of Dwight L. Moody*. In 1903-4 he made a tour of the world.

DE VYVER, AUGUSTINE. An American bishop of the Roman Catholic Church, died October 16, 1911. He was born in 1844 at Heisdonck, Belgium. His early studies were made in the city of Saint-Nicolas. He was raised to the priesthood at Brussels in 1870. He removed to the United States, and in 1899 was bishop of the Catholic diocese of Richmond, Va.

DIAMONDS. See **MINERALOGY.**

DIAZ, PORFIRIO. President of the Republic of Mexico until May 25, 1911. He was born in Oaxaca in 1830, the son of a father of pure Spanish blood and of a mother who was the daughter of a Spaniard and an Indian woman. When the boy was three years of age the father died, leaving the family in want. From his early youth he studied for the priesthood, but gave up the idea of that career and engaged in the study of law. This action was taken largely as a result of his acquaintance with

Juarez, the Indian, who later became president of Mexico. On the outbreak of the war with the United States Diaz declared himself against the continuance of Santa Ana in power and he was ordered arrested. He fled to the mountains and joined a band of Indian revolutionists. He became commander of the band and won a battle, but his forces were dispersed and Diaz remained in hiding until Santa Ana was superseded by General Alvarez, leader of the Liberals, in 1855. In the year previous he had commanded a battalion under Alvarez in a contest against Santa Ana. He was made sub-prefect of Ixtlan by President Alvarez, and he at once began organizing the Indians in his district into an army. In November of 1855 a revolution was started and Alvarez resigned the presidency. General Jose Maria Garcia became an opponent of the Liberals, with whom Diaz was identified, and the latter with his Indians attacked him while Garcia was on his way to attack Oaxaca. Garcia was induced to reëmbbrace the Liberal cause. Diaz's next military enterprise was an attempt to put down the uprising in Tehuantepec. He was here shot through the body, but recovered. At the age of 28 he was made lieutenant-colonel and when the revolution was put down and Juarez became president he was elected a deputy to the national Congress. He soon resigned from this body, however, and returned to the army. At the time of the attempt of Napoleon III. to establish an empire in Mexico, Diaz was engaged in fighting the rebel Marquez. He won a victory over this leader at Jalatlaco. After taking part in the battle of May 5, which was disastrous to the French, he was sent to Jalapa to take charge of the government and to be military commander of the state of Vera Cruz, which at that time was occupied by the French army. At this time he had not yet reached his 32nd year. During the French intervention he won a high reputation as one of the most skillful and courageous of the patriot leaders. After the battle of Santa Ines, he was made brigadier-general. Shortly after this engagement he was captured by the French, but escaped and joined President Juarez in the north, taking command of a native body of troops and reorganizing them. In 1863 he was made a general of division, the highest rank in the Mexican army. In the following year, however, he was obliged to surrender to the French General Bazaine and was imprisoned. He once more escaped and began a third campaign against the French invaders, but by this time the interference of the United States had compelled the withdrawal of the French troops. Diaz captured the Emperor Maximilian and marched into the capital in 1867. He was an unsuccessful candidate for the presidency against Juarez, and upon his defeat retired to his farm. In 1871 he organized a rebellion and took the field against the government. His brother Felix was killed and Diaz fled to the mountains. He had resumed the fight when Juarez died and Diaz recognized his successor, Lerdo de Tejada. In 1874 he formed a party in Congress and attempted to start a revolution against Lerdo. He was defeated and escaped to the United States. He returned to Mexico in 1876 and forming an army defeated Lerdo at Tocoac on November 16. In May, 1877, he became president.

Diaz's abilities as a ruler at once became evident. Order was restored in a remarkably short

time. He began the restoration of the country's credit and the wiping out of the bandits who infested the rural regions. In order to meet the payment of \$300,000 due to the United States he obliged the office-holders to do without their salaries and began an endeavor to interest United States financiers in the development of the country, particularly in the matter of railway building. As the constitution of Mexico provided that no man should hold the office of president for two consecutive terms, he was succeeded in 1880 by his close personal friend, General Gonzalez. Diaz himself became governor of Oaxaca. The credit of the country suffered under Gonzalez and Diaz was almost unanimously elected (1884) for a second term. The constitutional provision forbidding a second term, which he himself had caused to be passed, he now succeeded in changing and he continued in office term after term until his resignation in May, 1911. Diaz ruled Mexico with a firm hand and many charges were made against him of arbitrary conduct. He was in all essentials an absolute dictator, though under his administration Mexico became industrially prosperous. The abuses of his power became so onerous to the people that in 1910 a rebellion was started by Francisco I. Madero, one of the wealthiest capitalists of the country. This rebellion soon spread until it included nearly all the provinces of the republic. For the events which led up to the resignation of Diaz and brought about that event, see the political section of the article MEXICO.

DICEY, EDWARD. An English author and journalist, died July 7, 1911. He was born in 1832 in Leicestershire, England. He was educated at Trinity College, Cambridge, and in 1875 was called to the bar. He engaged in newspaper work and was connected for a time with the *Daily Telegraph*. From 1870 to 1899 he was editor of the *Observer*. Among his published works are: *Rome in 1860* (1861); *Cavour, a Memoir* (1861); *The Morning Land* (1870); *England and Egypt* (1884); *The Peasant State* (1895); and *The Story of the Khedivate* (1902).

DOCKS AND HARBORS. UNITED STATES NAVAL DOCKS. During the year Dry Dock No. 2 at the Boston Navy Yard was enlarged, as was Dry Dock No. 3 at Norfolk. At the latter, the largest battleships in the United States, in existence, or contemplated, could be satisfactorily docked. During the year progress was also made on three large docks under construction at

New York, Puget Sound, and Pearl Harbor, all of which were expected to be completed in 1912, or soon thereafter. It was recommended by the Secretary of the Navy that the Dry Dock No. 1 at Pearl Harbor, 800 feet in length, should be increased to a length of 1000 feet, so as to accommodate the largest ships that could pass through the locks of the Panama Canal.

NEW YORK PORT FACILITIES. During the year the United States War Department gave permission for the temporary extension of the piers of the city of New York 100 feet beyond the line previously fixed by its engineers. This permission, which was revocable at the will of the War Department, made it possible to accommodate the White Star S. S. *Olympic*, and doubtless would be extended to other vessels as the occasion develops. During the year an extensive study of the dock accommodations of the city of New York was undertaken, and a project advanced by Dock Commissioner Calvin Tompkins for the construction of new docks and the general handling of the commerce of the port was under discussion. The facilities of New York harbor were far from ample, and it was proposed to construct marginal railways and freight yards to facilitate the transshipment of freight between railways and steamships. No definite decision was reached on this plan, which was under consideration by the Chamber of Commerce and the maritime interests, as well as by the city authorities at the close of the year.

ORE PIERS ON THE GREAT LAKES. Important piers were constructed on the Great Lakes for use in connection with the loading and unloading of iron ore. These docks were notable for their mechanical facilities for handling the ore. One of two large piers built during the year for shipping ore was built of steel, while the other was of reinforced concrete, in which the steel reinforcement formed a complete and self-supporting structure before the concrete was placed. This pier is 1200 feet in length, 60 feet wide, and has its rail level, from which the freight cars bringing the ore from the mines empty their contents into pockets, 75 feet above the water. The two rows of pockets number 200 in all, and there are two lines of track over each row. From the pockets, whose ore capacity aggregates some 60,000 tons, the ore is discharged direct into the hatches of steamers and barges. A new pier at Cleveland where the large ore barges and steamers are discharged was also built of concrete, 1000 feet in length, and carrying on its deck electric unloaders of the walking beam type which transferred the ore from the hold of the ship to a concrete trough extending the length of the pier. From this trough, by means of a traveling conveyor, the ore can be transferred from the ore trough to two stock piles 800 feet in length.

PORT OF MONTREAL. At Montreal, Canada, important harbor works were in course of construction, and many improvements were planned for the development of shipping facilities. There was under construction a new basin 1000 feet in length, 500 feet in width, and 30 feet in depth, which was to contain a floating dock able to accommodate vessels of 25,000 tons. A shipyard 35 acres in extent for the use of deep-water vessels was laid out by the Harbor Commissioners.

ROSYTH NAVAL DOCK YARD. The construction of the new British Naval Dock Yard at Rosyth on the north shore of the Firth of Forth was

put under way in 1909, and the work authorized by Parliament up to the end of 1911 involved an expenditure of between three million and four million pounds sterling. The main contract included the construction of basins, docks, and the reclamation of land available for future warehouses, repair shops, and other works and buildings required for the accommodation of a naval fleet. The Rosyth site includes an area of 1200 acres, with 200 acres of fore-shore. At the end of 1911 almost one-quarter of the original foundation of the big work had been completed so that the super-structural work could be prosecuted with rapidity.

PORT OF LONDON. At the beginning of 1911 the new port authorities of London submitted their first report in which a scheme for the improvement of the London docks and of the navigation of the Thames was outlined at an estimated cost of 14½ million pounds sterling. A period of twenty years will be required for the improvements, and the first work will be the erection of a new deep-water dock of 65 acres in connection with the existing Albert Dock. The estimated cost of the new dock was 2¼ million pounds sterling, and it was to be completed in five years. It was to have a depth of water 38 feet, and be 800 feet in length, 100 feet in width, and 45 feet deep on the sill. Further improvements were projected at other docks on the Thames, necessitated by the increased size of the vessels using them. Within twenty years there had been an increase in vessels over 500 feet in length from 11 to 234, and the average length of the 20 largest vessels was 700 feet. In order to maintain the position of London as a port, it was deemed necessary to increase the channel to a width of 1000 feet and 30 feet depth at low water on that portion used by the larger vessels, and on the part above as far as London Bridge narrowing to 450 feet in width and 14 feet in depth.

LIVERPOOL. Dredging continued during the years 1910 and 1911 in the Mersey so that the mean depth at low water through the bar channel was maintained at from 29 to 31 feet. The stone revetment on Taylor's bank, opposite Askew Spit, was finished at the end of the year 1911, and the dredging of the shoal for sea-going boats in this channel was begun again.

SOUTHAMPTON. The development of the port of Southampton continued during 1911, and in June a new dock 16 acres in extent was opened. This dock has a depth of 40 feet at low water and is able to accommodate such vessels as the *Olympic* and *Titanic*; in fact, being used by the former during the year. The dry dock at this port which was opened in 1907 was being enlarged to a length of 897 feet. Considerable shore property had been acquired for further dock developments.

BELFAST DOCK. In March, 1911, a new dry dock, which had been under construction for seven years, was completed, and the liner *Olympic* was docked in it. It was one of the largest dry docks in existence, being 850 feet in length by 100 feet in width, and capable of taking vessels of 45,000 tons and 34 feet draught. It was constructed on land reclaimed from the sea at a cost of over three-quarters of a million pounds sterling. Its concrete floor is 17½ feet thick, and the pumping machinery driven by engines of 3000 horsepower is capable

of pumping 23,000,000 gallons of water in 1½ hours.

BELGIUM. Considerable harbor improvement was undertaken on the Belgian coast during the year, with the aim of improving the approaches to the various ports. The two channels leading to Ostend were dredged, and a proposition to improve the approach to Antwerp by making a cut come across a bend in the river Scheldt below the city was approved by a special commission. Harbor improvements, including the construction of a dry dock for fishing vessels and the dredging of the channel, were also under consideration at Nieuport, and much work was done for deepening the waterway of the new channel up the Maas to Rotterdam. The reach between Poorthaven and the Hook of Holland was deepened, and an embankment on the left bank of the river opposite Maastricht was under construction.

RUSSIA. A new dry dock at Kronstadt which had been under construction by the Russian government for 3½ years was opened September 12. Its principal dimensions were, maximum length, 856 feet; serviceable length, 750 feet; width, 120 feet; depth of sill, 35 feet.

RIO DE JANEIRO. Substantial improvements at the harbor of Rio de Janeiro, Brazil, were reaching completion in 1911 in accordance with the plans proposed by the government commission appointed in 1903 to consider the improvement of the port. While Brazil has naturally a fine harbor, yet for many years large vessels had to employ lighters for discharging and loading cargo, and, consequently, it was decided to build quay walls 1100 feet in length, with a depth of water from 28 to 33 feet in front. These were constructed of concrete by the use of cofferdams and caissons. The port improvement included also the reclamation of a large area of low land and dredging.

ARGENTINA. At Buenos Ayres contracts were awarded for the construction of four new docks with quays of over three miles in extent. On these were to be erected warehouses containing 100 acres of floor space and 300 acres of land were to be reclaimed. Another important Argentine project was the construction of a new port in the Bay of Samborombam on the coast 150 miles south of Buenos Ayres. This involved the dredging of an approach 9½ miles in length, and increased depth of water. The work was being done for the Grand Central Railway Company of Argentina.

URUGUAY. At Montevideo, Uruguay, it was proposed to enclose the shore to the south of the city by an embankment 2½ miles in length, and thus reclaim 358 acres of land. The embankment is to afford an esplanade and the land thus formed is to be valuable for building.

DOLOMITE. See GEOLOGY.

DOMINICA. An island of the British West Indies; one of the presidencies of the Leeward Islands (q. v.). Area, 304½ sq. miles. Population, census of 1911, 33,863. Chief town, Roseau (about 6500). Imports, 1909, £128,779; 1910, £147,322. Exports, £102,339 and £112,111. Revenue, 1909-10, £39,521; 1910-11, £41,472. Expenditure, £41,860 and £39,050. Debt, 1911, £47,295. Administrator, 1911, W. Douglas Young.

DOMINICAN REPUBLIC. See SANTO DOMINGO.

DOMINGUEZ, JOSÉ LOPEZ. A Spanish statesman, former prime minister, died October

18, 1911. He was born in Marbella, Spain, in 1829 and received his education at the Artillery School at Segovia. At the age of 21 he received a commission in the Third Regiment of Artillery at Seville. In 1854 he joined O'Donnell in the revolution against Queen Isabel, and on its success received advancement largely through his connection with his kinsman, Serrano y Dominguez. On the outbreak of the Crimean War he was attached to the Spanish mission with the headquarters of the French army. In 1858 when O'Donnell became premier, Dominguez entered the Cortes. On the outbreak of the Italian War he was attached to the headquarters of Napoleon III. When this campaign was over he served as commander of a battery. In the Moroccan War he distinguished himself in several engagements. On his return he was reelected to the Cortes. In 1866 he signed the protest to the queen against the indefinite adjournment of the Cortes, and as a result suffered imprisonment. He was shortly afterwards implicated in a conspiracy against the government of Gonzalez Brabo and was sent into exile to the Canaries. He returned in time to take part as colonel of cavalry in the battle of Alcolea, where he was promoted to be brigadier-general. This victory and the flight of Queen Isabel left Serrano y Dominguez, now Duke de la Torre, master of the situation, and Dominguez remained with the latter as secretary during his regency. Upon the foundation of the republic he was made captain-general of Burgos and was later sent by Castelar against Cartagena, which was in the hands of the Federals. He took the town by assault and was promoted to be lieutenant-general. On the outbreak of the Carlist War he acted as chief of staff to the Duke de la Torre, and then went to Caledonia as captain-general and commander-in-chief. There, by defeating the Carlists, he saved that province for the government. Upon the restoration of the monarchy he returned to Madrid and accepted a seat in the Superior Council of War, retiring shortly afterwards on a pension. For thirty years following he devoted himself to active politics. In 1883 he was one of the creators of the Dynastic Left, whose programme was based on the guarantees of the constitution of 1869. He became minister of war in Herrera's government, and in Sagasta's government in 1893. In this office he carried out many reforms. In 1895 he was promoted to be captain-general. He became president of the Senate in 1905 and in the following year premier and minister of war. His ministry was short-lived, as the violence of his anti-church policy split the Liberal party. He resigned in November, 1906. He never again held office, though he continued to be the titular leader of the democratic party, of which Señor Canalejas was the guiding influence. He lived under four sovereigns, three regencies and a republic.

DOYLE, Sir ARTHUR CONAN. See LITERATURE, ENGLISH AND AMERICAN, Fiction.

DOURINE. See VETERINARY SCIENCE.

DRAINAGE. The practical exhaustion of free land in the western part of the United States has turned attention to the unproductive land in other sections of the country, bringing about, in the last few years, great activity in the drainage of swamp lands and the protection of overflowed lands. It is estimated that there are in the United States about 70,000,000 acres of such land which can be reclaimed for agri-

culture. While the United States is experiencing greater activity in drainage work than any other country in the world, much work is being done in other countries. In Italy, in the eastern part of the valley of the Po, large areas are being drained by local districts with the aid of the Italian government. This land requires both protection and drainage. In Egypt the increased water supply made available by the Assuan dam has led to serious injury of large areas in the Nile delta by the rise of the ground water, greatly reducing the area on which cotton can be grown. For the relief of these conditions drainage is necessary and is being undertaken. Russia is taking an active interest in draining its wet lands, of which there are several million acres, chiefly in the northern part of European Russia. While almost every State in the United States has some swamp lands which can be drained, the larger part of these lands lies in two districts—the Mississippi valley, from Minnesota to Louisiana, and the coastal plain along the Atlantic Ocean, from the mouth of Chesapeake Bay to the lower end of the peninsula of Florida.

Much of the land of the upper Mississippi valley has been protected from overflow and drained for many years, and the greatest activity in the past few years in this valley has been along the lower river, although much work is still being done along the upper river. The largest projects now under way lie along Little River in southeastern Missouri, the St. Francis River in northeastern Arkansas, the Yazoo River in Mississippi, and on the so-called "floating prairies" in Louisiana near the mouth of the Mississippi, but extending up as far as New Orleans.

In Missouri and Arkansas this work is being done under general drainage district laws, which provide for raising funds for construction by the sale of bonds which are a lien on the land benefited. In Mississippi the work has been done by districts created by special acts, but this practice has been declared unconstitutional by the courts, and it is expected that a general law providing for the action and operation of such districts will be enacted. In Louisiana the work is being done by development companies, which are draining the land and usually selling it in small tracts. The work in Louisiana is different from that in the other States named, in that there is no gravity outlet for the surplus water, and consequently it must be pumped. The system used is to inclose the land to be reclaimed in dykes and run canals through this land to carry the water to the pumps, by which it is lifted over the dykes and discharged into the adjacent swamp, rather than into a stream or canal.

Drainage work on a large scale along the south Atlantic coast is of recent date. Within the last three years drainage district laws have been enacted in North Carolina, South Carolina, Georgia, and Virginia, and in all these States large areas are being reclaimed under these laws. These district laws, like others, provide for the sale of bonds, which are a lien on the land benefited, and for the collection of principal and interest as well as the cost of operation and maintenance by taxation.

A part of the famous Dismal Swamp in Virginia has been formed into a district, and plans are being made to reclaim another section of this swamp in North Carolina. Another large

project in North Carolina provides for the drainage of Lake Mattameskeet. In South Carolina large areas of swamp land in the vicinity of Charleston have been drained, greatly improving sanitary conditions as well as agricultural conditions.

The Everglades of Florida form the largest single swamp area in the United States. The land within the Everglades belonged to the State, under the swamp land grants, and the State has undertaken its partial reclamation by providing main canals to carry off the surplus water and lower the level of Lake Okechobee during dry seasons, making it available for storage during wet seasons. The State is excavating these canals and has sold much of the land to development companies which are selling it in small tracts to non-residents on partial payments.

So much interest in drainage has been aroused that there was formed at Chicago, December 8, 1911, the National Drainage Association for the purpose of obtaining federal aid for drainage. It is contended that since many of the streams along which lie the lands to be reclaimed are interstate streams, and since these streams must be treated as units to be controlled to the best advantage, it is necessary for the federal government to take control of this work, instead of leaving it to local districts created under the laws of the several States. It is urged also that the federal government should advance funds for the work of drainage, the whole work of the federal government being based on its power to control navigation.

Along with this activity in public drainage there has been a rapid extension of farm drainage, principally by the use of tiles. The most rapid extension of tile drainage has been in the upper Mississippi valley and Indiana and Ohio, several million acres having been provided with tile drains in this section within the last few years.

The swamp lands of the United States, generally, are near to markets, and are of great natural fertility, and they can be reclaimed well within the cost of improved lands in the same general localities. It may be expected, therefore, that the reclamation of swamp lands will make rapid progress so long as the present high prices of farming lands prevail.

DRAINAGE ASSOCIATION, NATIONAL.
See DRAINAGE.

DRAMA. After two seasons, during which the fate of New York's New Theatre hung in the balance, the establishment was closed in the spring of 1911, and before the end of the year finally abandoned. Thus ended the most ambitious and costly attempt yet made in this country to found a theatre which should set the standard for dramatic art in the United States, as the Comédie Française of Paris does for France and the Burg Theater of Vienna does for Austria. A fairly full account of the inception of this enterprise, and its too brief history, may be found in the YEAR BOOKS for 1909 and 1910.

Many reasons have been given for the failure of the New Theatre. The score of rich men who founded it were prepared to lose some money and to carry the establishment along for a term of years at a loss. It is well known that the best theatres of Europe have to be helped with a subsidy from the state. It was expected that the house might need help for several years, and when it opened in 1909 it was said by some of

the founders that a deficit of \$100,000 a season would not cause dismay. But the loss proved to be more than double that sum. Half a million dollars is said to have been spent in the experiment. Probably the chief blame for the failure should be placed upon the building itself, which, while beautiful and luxurious, proved unsuitable to its purposes. It was too large for all but spectacular productions. Dramas and comedies failed of their intended effect because actors could not be properly heard or seen. Naturally, there has been much criticism as to the artistic conduct of the enterprise. Not all the new plays produced were worthy of the honor, and not all the old ones revived were well given. It was realized too late that with a smaller and less pretentious house the experiment would almost certainly have proved a success. Audiences large enough to fill a smaller house were lost in the New Theatre, to the discouragement of the players and consequent injury to the performance. This was felt so strongly that when the New Theatre building was finally abandoned the founders voted to build another house half the size and continue the enterprise. Ground was bought for the purpose and the project may some day be carried out, although for the present it is in abeyance.

The artistic results achieved by the New Theatre during its two years' existence cannot be ignored. The enterprise failed, but the company, which comprised such excellent people as Edith Wynne Matthison, Rose Coghlan, Jessie Busby, Mrs. Sol Smith, Mrs. Harriet Otis Dellenbaugh, Messrs. A. E. Anson, Louis Calvert, Robert Bruning, Ferdinand Gottschalk, E. M. Holland, and Frank Gillmore, was concerned in a number of productions that will be remembered with pleasure. Such spectacular pieces as Maeterlinck's *Blue Bird*, the sumptuous revival of *The Winter's Tale*, comedies such as *Don*, by Besier, and Pinero's *Thunderbolt* may be cited. While the productions at the New Theatre often lacked brilliancy, there was a dignity and an artistic conscience evident that had its effect. Enough was accomplished to make it reasonably certain that another attempt will be made in the near future to establish a representative American theatre.

Looking over the record of new plays produced in the United States in 1911, it may be said that the year will be remembered for many productions of a serious or semi-serious type. There were no dramas of such popular appeal as *Alias Jimmy Valentine* and no comedies superior to *The Concert*, both of which plays were fixtures in New York during 1910. On the other hand, there were several plays that showed more plainly than ever the independence of the American stage. A generation ago this stage was almost wholly occupied with the work of Englishmen or with adaptations from the French or German. Since then the tide has turned. The most successful serious play of the year was probably Augustus Thomas' *As a Man Thinks*, which placed the author at the head of American playwrights. *The Witching Hour* of Mr. Thomas was one of the strong plays of the last few years, but *As a Man Thinks* has a literary quality as well as a dramatic force far beyond that fantastic achievement. It sketches admirably the manner in which a man of power and heart may help his fellow men. Mr. Thomas makes his protagonist a Jew, but he might just as well have taken a Gentile. Vedah, the daughter of a Jewish doc-

FOUR LEADING DRAMATISTS OF 1911

tor, is engaged to marry a certain Benjamin De Lota, whose life has not been clean. She does not love him, but has given her heart to a young sculptor. De Lota's misdeeds involve the wife of a Gentle, whose husband, upon discovering his wrongs, vows to bring two homes to dishonor. The situation is saved by the wisdom of Dr. Seelig, who argues for sanity and moral cleanliness in a way that carries conviction. In his long career Mr. John Mason has done nothing better than in his portrayal of Seelig. The poison of race hatred, the saving grace of kindness, are brought into contrast with exquisite effect by an actor whose rôle of mentor might easily tend to preaching of the tedious character if less skillfully handled. Mason had splendid assistance from Miss Chrystal Herne, as the erring wife, and from Miss Charlotte Ives as the young Jewish girl. Messrs. John Flood, Walter Hale, and Vincent Serrano were also conspicuous in this strong play.

Another American playwright, William C. De Mille, deserves credit for one of the noted plays of the year, *The Woman*, in which he had the valuable assistance of David Belasco, a past-master in stagecraft who can make vivid and interesting incidents that, less skillfully treated, might dwindle to theatrical clap-trap. In order to smirch the reputation of a political leader a certain woman's name is needed. The pulse of the drama is felt when a telephone girl's blunder may lead to the vital discovery. Mr. John Cope, who in 1910 played a minor part in *The Concert* with notable skill, was the endangered politician, acting with admirable force; while Miss Mary Nash, who will be remembered by playgoers as one of the best figures in the late Clyde Fitch's *The City*, did exceptionally good work as the telephone girl. Mr. Belasco's stage management was equally conspicuous in a play of his own, *The Return of Peter Grimm*, with David Warfield as the chief figure. Here again was a play which might easily have degenerated to melodrama but for exquisite handling upon the part of the star and his stage manager. Peter Grimm is a worthy old fellow who, dying, leaves his beloved ones exposed to rascality of which he did not dream. He returns to put matters right, standing behind the actors in the little drama and suggesting to them his wishes. Mr. Belasco takes the stand that a man's active power for good does not cease when death comes and that his spirit is still to be reckoned with. People who reject the supernatural altogether may find *The Return of Peter Grimm* a preposterous affair, but no one will deny its ingenuity, nor the rare art which Mr. Warfield brings to it. He has contributed to the stage nothing more exquisite than his first-act picture, in which the old gardener, Peter, in his quaint home tries to make sure that after he goes those dependent upon him will be happy. Every part in the drama is well done. Next to Mr. Warfield himself, the chief honors fell to a remarkable boy, Percy Helton, who, as the sensitive medium through whom Peter Grimm's wishes are transmitted to the living characters, proves that all children are not nuisances upon the stage. Both these plays held the New York stage for many months.

The Havoc, by E. S. Sheldon, had but a short life in New York, but was remarkable for some fine acting by Henry Miller. Only four persons are involved. Henry Craig, finding that his wife

and a certain Paul Hessert have fallen in love, offers to give way to the latter or shoot him. Hessert takes the husband's place and Craig boards with the couple. It is the old story of *Divorçons* seriously treated. The lover becomes jealous of the husband, who remedies the havoc made by two frivolous persons. Of more popular appeal was George Broadhurst's *The Price*, in which Miss Helen Ware proved her right to a conspicuous place upon the local stage. It was a good example of the emotional drama. A young girl becomes the secretary and finally, under temptation of loneliness and poverty, the mistress of an artist whose wife is the typical household drudge, faithful but uninteresting. The girl falls in love with a certain doctor and after the artist's death is married to him. The doctor needs a housekeeper and, of course, it is no other than the widow of the artist who obtains the place, and proceeds to wreck the household. The husband learns of his wife's misstep, and the price she pays is his lurking suspicion that having gone wrong once she may do so again. The solution is left to time. The chief figures are capably drawn, while the main theme, which suggests Emerson's theory of compensation, the ultimate reward or punishment in ratio to the initial good or evil, is adequately handled. The two women concerned did excellent work. Miss Ware sounded the emotional note with a sure touch and made the woman appealingly human, with just enough of the alloy of weakness necessary for the conditions essential to the tragedy involved. Harrison Hunter gave a good portrayal of the doctor.

The Piper, a play in verse by Josephine Preston Peabody (Mrs. Lionel S. Marks), to which was awarded the Stratford (England) prize of \$1500, in 1910, was produced in the New Theatre and greatly praised as a piece of literature. Its dramatic value was less evident. Mrs. Marks takes Browning's "Pied Piper" as a foundation, adding to it a love story and making the Piper the mouthpiece for much philosophy concerning the wrongs of blighted childhood, the formalism of churches, and man's inhumanity to man. The title rôle fell to Miss Matthison, who did all that a woman could with a part essentially masculine. Her embodiment of the Piper was rich in intellectual and artistic suggestion, alert, buoyant, by turns pathetic and humorous. But its limitations were sharply marked. The New Theatre production was in good taste and gave a fitting setting to Mrs. Marks' poetic variant of a mediæval legend. Mrs. Marks' *Piper* was not the only ambitious play by an American woman produced in this country during the year, for Miss Margaret Anglin brought out in Boston a three-act tragedy by the late Julia Ward Howe, entitled *Hippolytus*. Miss Anglin acted Phædra with fine zeal. While Mrs. Howe's drama, which was given but once and more as a curiosity than anything else, makes no appeal to the playgoers of to-day, its production is worthy of record.

Here may also be mentioned the American production of Rostand's *Chanticleer*, which comedy was the European sensation of the previous season. As in the case of *The Piper*, *Chanticleer* suffered by the miscasting of the chief part, which, even more than in the case of Mrs. Marks' play, required a man. Miss Maude Adams, excellent actress though she is, attempted the impossible when she appeared as Chanticleer, a part played to perfection in the Paris

production by Guitry, one of the most virile of actors. Everyone knows that Rostand intended it for Coquelin, an actor gifted with a wonderful voice and rare elocutionary powers. To intrust such a part to a player whose acting powers lie within a narrow gauge and whose physical resources are hopelessly inadequate to the demands made upon them, was to invite disaster, notwithstanding which the public flocked to the performance, thanks partly to Miss Adams' personal popularity and the beauty and novelty of the stage trappings. Mr. Louis N. Parker furnished a satisfactory English version. *The Garden of Allah*, a dramatization of Robert Hichens's romance of the same name prepared by the author assisted by Mrs. de Navarro (Mary Anderson), proved to be a gorgeous spectacle if not much else. Much was made out of the scenes in the desert, dressed out with a wealth of Oriental detail in the way of real Arabs, camels, etc. Mr. Lewis Waller, an English actor of note, made much of the part of Boris. Also Oriental in its appeal was *Kismet*, a romance of the Arabian Nights by Edward Knoblauch, in which Mr. Otis Skinner, an actor of much resource, appeared to advantage. To the same playwright is to be credited *The Faun*, in which William Faversham showed the sort of havoc that a truth-telling person may create in polite society, an old theme treated with no little skill and from new points of observation. Mr. Faversham again showed intelligence and artistic conscience. Another play involving an Oriental setting was Edgar Selwyn's *The Arab*, which had a brief career.

In the way of serious comedy, one of the notable plays of the year, an English importation, was A. E. W. Mason's *Witness for the Defense*. As the young woman charged with murder, Miss Ethel Barrymore did the best work of her career, playing with unexpected subtlety and strength. She had admirable support from A. E. Anson, whose poise and virile power helped to make the performance one of the most successful of the season. A more serious comedy, in fact rather depressing, was Ibsen's *Lady from the Sea*, first given in Chicago by the Drama Players, a local organization, and later repeated in New York. Although familiar to the German stage, it has been seen in this country but a few times and can hardly be said to have made a deep impression. The part of the lady whose life is haunted by dread of a terrible person who threatens to drag her back to the sea, was played with skill and sympathy by Miss Hedwig Reicher, a recruit from the German stage. The same company gave a pleasant performance of Prof. Curtis Hidden Page's translation of Molière's *Femmes Savantes* under the title of *The Learned Ladies*.

Of small artistic value, calling for nothing beyond record, were C. M. S. McLellan's *Judith Zaraine*, in which Miss Lena Ashwell appeared; *Thais*, a drama founded upon Anatole France's novel, in which Miss Constance Collier disported herself; *The Confession*, by James Reid, a play dealing with the inviolability of confessions made to a priest; *Everywoman*, a fantastic allegory in the style of *Everyman*, by Walter Browne; and Louis N. Parker's *Lady Godiva*, a version of the Coventry legend, with Miss Viola Allen as the Lady. Of slight interest was J. M. Patterson's *The Rebellion*, a divorce study illustrated by Miss Gertrude Elliott. Holbrook Blinn, an actor of some power, made a

popular success with *The Boss*, a drama of politics and business by Edward S. Sheldon; and Miss Margaret Illington harrowed up the feelings of her audience with a realistic sketch of a weak, miserable, poverty-stricken woman in *Kindling*, by Charles Kenyon. Among foreign adaptations of serious plays may be noted a version of Pierre Wolff's *Marionettes* with Madame Nazimova in the chief part, and *The Great Name*, from the German of Victor Leon and Leo Feld, in which Henry Koelker was a musical genius. *The Deep Purple*, a melodramatic picture of criminal life, by Messrs. Armstrong and Mizner, thrilled the public which likes to be thrilled by such plays. *Bought and Paid For*, by George Broadhurst, will be remembered for the good comedy work of Frank Craven and an unpleasant drunken scene which went far to neutralize this good work.

In the field of light comedy, one of the final productions at the New Theatre, Miss Symond's *Nobody's Daughter*, an English importation, was interesting and beautifully played by Miss Pamela Gaythorne, A. E. Anson, E. M. Holland, Frank Gillmore, and others. The story of a delightful waif, who, after sundry tribulations, attains happiness, was pleasantly told. *Passers-By*, a success of the season of 1910-11 in London, showed once more Haddon Chambers' dainty touch and quiet humor. As a story it lacked probability, but in its sketches of various London types it ranked with the best minor plays of the year. Miss Anglin appeared in an amusing comedy by A. E. W. Mason entitled *Green Stockings*, a titled derived from the old Irish custom which prescribes green stockings for the unmarried elder sister at the younger sister's wedding. The efforts of a young woman to get rid of the green stockings make up a clever little play. Of more importance was Mr. Parker's *Disraeli*, which afforded George Arliss opportunity for a remarkable sketch of the English statesman. There is not much of a play, but Mr. Arliss, in a wonderful counterfeit of "Dizzy" as known by countless pictures and caricatures, was an effective figure in the various incidents strung together by the author. John Drew's annual contribution to the gaiety of the stage was made with Hubert Henry Davies' *A Single Man*, not so clever a play as the author's *Molluso*, but offering the sort of part that suits Mr. Drew, who plays the amiable middle-aged bachelor who ought to be married and is married before the curtain falls. *The Runaway* provided Miss Billie Burke with a chance to exert her coquetry and also show a touch of pathos. It was adapted from the French. Mrs. Minnie Maddern Fiske found in a farce comedy, Mrs. Bumpstead-Leigh, by Harry James Smith, material that served her well. Mrs. Fiske reveled in the part of a woman with a past that must be hidden at all costs, but constantly threatens to ruin her social ambitions. An adaptation of Henri Lavedan's *Sire*, in which a half-demented lady, a royalist fanatic, is deceived into believing that a masquerading mountebank is the lost Dauphin of France, was seen with Mr. Otis Skinner in the part of the imposter. *The Old New Yorker*, by Harrison Rhodes and Thomas A. Wise, with the latter as star; *The Senator Keeps House*, by Martha Morton, with William H. Crane as the chief figure; and *The Cave Man*, in which Gellert Burgess plays upon the foibles of polite society, with Robert Edeson as the coal heaver,

MAUDE ADAMS

FOUR LEADING PLAYERS IN 1911

who becomes a drawing-room idol, were some of the comedies worthy of note. A one-act sketch by J. M. Barrie, *The Twelve-Pound Look*, a lesson to husbands who forget that wives need more than food, silk, and diamonds, was presented by Miss Barrymore. A version of *Vanity Fair* by Robert Hichens was brought forward by Miss Marie Tempest, who played Becky Sharp. The New Theatre company helped the English star in a creditable performance.

Of the farces of the year perhaps none had more success than *Excuse Me*, by Rupert Hughes, depicting what might happen on sleeping cars on a cross-continent trip. There were also Charles Klein's *Maggie Pepper*, vitalized by Miss Rose Stahl of *Chorus Lady* fame; and *The Never Homes*, in which George W. Monroe acted. The farce crop was large but not notable for quality.

An interesting event of the year was the appearance in America of a company of Irish players who presented in an unpretentious but competent fashion some of the plays of the late J. M. Synge, one of which, *The Playboy of the Western World*, aroused here, as it had previously done in Ireland, much opposition from Irishmen who denounced it as a libel upon the national character. That a man who is supposed to have killed his father could fail to be held in universal execration by the Irish peasantry was held to be a false note that called for rotten eggs by way of criticism. The literary and dramatic value of Synge's work was made known here for the first time, and the company presented several plays of interest by Yeats, Lady Gregory, and Bernard Shaw, whose *Unmasking of Blanco Posnet* was a curious mixture of good and bad. A Scotch company came to this country to give *Bunt Pulls the Strings*, a delightful little comedy of Scotch life, by Graham Moffat, played to perfection. Madame Simone, the French actress of emotional drama, appeared in English in Bernstein's plays, *The Thief* and *The Whirlwind*. Perhaps the handicap of a foreign language caused her to be less successful than her high reputation in Paris warranted her friends in expecting.

ENGLAND. Rudolf Besier's *Lady Patricia* was perhaps the success of the year on the London stage. Local report characterizes it as a caricature upon the mannerisms of Mrs. Patrick Campbell, who acted the part of a middle-aged woman who finds out in time that romantic philandering with younger men is not wise. The London critics exhausted their complimentary adjectives in praise of the humor of the comedy and the capital acting of Mrs. Campbell, who of late years has not been fortunate in her theatrical experiments. The prolific Somerset Maugham brought out *The Loaves and Fishes*, a comedy in the style of Bernard Shaw, with some clever dialogue devoted to satirizing English society. Also well received were Jerome's *The Master of Mrs. Childers*, revolving around an election in which the wife beats the husband, and Pinero's annual contribution, *Preserving Mr. Panmure*, an amusing study of an arch-hypocrite who frowns upon cards, wine, and frivolity, only to be caught playing Romeo under disgraceful conditions. Far less exhilarating was a one-act sketch by Henry James, *The Saloon*, in which he proves once more his literary grace. The critics called it dreary. A rollicking little comedy by Henry Arthur Jones was *The Ogre*, a pater familias who teaches his

frivolous family that life is not all beer and skittles. Mr. Alexander played the title rôle. *One of Dukes*, by George Pleydell, offered Mr. Cyril Mauda opportunity to play the silly ass he does so well. Mr. Bouchier produced a serious drama in blank verse by Israel Zangwill, entitled *The War God*, a species of allegory in which Bismarck, Tolstoi, and other great men figure. There was also in London an elaborate revival of *A Midsummer Night's Dream* by Sir Herbert Tree, and a dramatization of Hichens' *Bella Donna*, in which Mrs. Patrick Campbell appeared.

FRANCE. Bernstein's *Après Moi*, a three-act drama produced at the Théâtre Français, was the cause of a riot in Paris owing to anti-Semitic cabals against the author and had to be withdrawn. Its subject is Bernstein's usual triangle of marital infidelity, blended with agony for all concerned. As drama it was not considered by French critics the equal of the author's best plays. Paul Bourget had a new drama entitled *The Tribune*, which owed most of its success to the acting of Guitry. Neither Porto-Riche's *Le Vieil Homme*, nor Trairieux's *La Brébis Perdue*, a dramatization of Balzac's "Curé de Village," produced at the Français, achieved popularity. Bataille's *L'Enfant d'Amour*, with Madame Réjane in the chief part, proved to be a powerful but depressing drama in which a son sacrifices all for his mother. Other domestic dramas that caused some talk were *La Flambee*, by Henry Kistemaekers, and *L'Inquiété* in which is sketched the disillusionment of a woman who falls in love with a failure. The successful farce of the year in Paris was *La Petit Café*, by Tristan Bernard, whose hero, a waiter with a soul above his position, was wonderfully played by Le Gallo. *Papa*, by MM. De Flers and Caillavet, turns upon the self-effacement of a young man whose sweetheart is appropriated by his father.

Hauptmann's *The Rats*, produced in Berlin, was a harrowing tale of poverty, crime, and suicide. The dramatic sensation of the year in Berlin was Max Reinhardt's revival of the second part of *Faust* upon a colossal scale, requiring six hours for its performance, forty-seven scenes, and between four hundred and five hundred players in the mob scene. In St. Petersburg, Maxime Gorky's new play *Queer People*, based upon the "affinity" problem, failed to interest the public.

The world was made poorer by the death in May of Sir William S. Gilbert (q. v.), whose admirable comedies are now classics. Kyrle Bellew, an English actor well known in the United States, died in November.

DRAWBAUGH, DANIEL D. An American inventor, died November 3, 1911. He was born in 1827 and received his education in the public schools. At sixteen years of age he was obliged to leave school and began the work of repairing clocks, guns, and machinery, in which he displayed remarkable skill. In 1860 he began to experiment with the electrical transmission of speech and in 1869 invented an instrument which suited his ideas. He improved the receiver in 1871. After 1873 he was constantly engaged in inventing and perfecting new machines. He always maintained that he, and not Professor Alexander Graham Bell, should be honored as the inventor of the telephone. In 1881 he laid claim to the invention, merging his interests with the People's Telephone Com-

pany, an independent concern. The suit, however, was decided against him. Among his many inventions may be mentioned the collapsible lunch box, a nail-making machine, electrical grain-weighing devices, an interchangeable telephone and telegraph apparatus, pneumatic tools, telegraph senders, and many other devices.

DREADNOUGHTS. See **BATTLESHIPS**.

DREDGING. A powerful dredger, the *Corozal*, was built in 1911 on the Clyde at Renfrew, Scotland, and was launched in September. This vessel was built for the United States government for use in the construction of the Panama Canal, and the placing of the order with a foreign firm occasioned considerable controversy in the United States. The bid of the Scotch ship builders (\$399,340) was so greatly below the lowest tender of an American yard (\$874,146) that the government decided to award the contract to British builders. This powerful dredger has a capacity of 12,000 tons of material, and the bucket ladder can work to a depth of 50 feet. The vessel is propelled at a speed of ten knots an hour by two systems of tripple-expansion engines. Either of the main controlling engines can drive the dredging gear, and three sets of buckets have been arranged to suit various kinds of material. These buckets are of 54 cubic feet capacity for use in dredging soft material, and of 35 cubic feet for dredging stiff clay.

During the year there was under construction at the yards of the Fore River Shipbuilding Company a new suction dredge for the United States government. This new vessel, the *New Orleans*, is for service at the Southwest Pass of the mouth of the Mississippi River, and is 315 feet long, 50 feet beam, and 26 feet depth of hold, with hoppers of a capacity of 3000 cubic yards, and her coal bunkers having a capacity of 300 tons. The suction pipe, which is hinged near the stern of the ship by hollow trunnions, is 20 inches in diameter, and is lowered through a well in the centre of the stern, so that the suction head, resembling a huge rake, with sharp cutting teeth, operates like a scraper bucket as the ship moves forward. See also **DOCKS AND HARBORS**.

DRESSER, SOLOMON ROBERT. An American public official and inventor, died January 20, 1911. He was born in Litchfield, Mich., in 1842, and was educated in the common schools. He engaged in manufacturing, and in 1880 took out his first patent. Among his inventions are a packer for natural gas and oil wells, a rubber coupling to make a tight joint in natural gas pipes, and an insulating coupling to prevent the leakage of electricity from conduits. He was elected to the Fifty-eighth and Fifty-ninth congresses in 1903 and 1907 as a Republican from the twenty-first Pennsylvania district.

DRUGS. See **FOOD AND NUTRITION**.

DRYDEN, JOHN FAIRFIELD. An American insurance official, former United States senator from New Jersey, died November 24, 1911. He was born near Farmington, Me., in 1839. He entered Yale College in 1861, but left before graduation on account of illness. He became a life insurance agent and made a careful study of its underlying principles. He conceived the plan of establishing industrially insurance in the United States as practiced in England. After several years spent in mastering the theory and practice of the subject, he founded in 1873 at Newark, N. J., the Widows'

and Orphans' Friendly Society. In 1875 this became the Prudential Life Insurance Company. The company from the first met with great success and is now one of the leading life insurance companies of the United States. In 1896 and in 1900 Mr. Dryden was a presidential elector from New Jersey. In 1902 he was elected United States senator for five years to fill the unexpired term of William J. Sewell, deceased. In 1907 he was a candidate for reelection, but the opposition was so great that he withdrew his candidacy in favor of John Kean. Mr. Dryden was one of the organizers of the Public Service Corporation of New Jersey and was largely interested in other industrial and financial companies. He was interested in forestry and the conservation of other natural reserves, and shortly before his death had arranged to devote a large section of land owned by him to reforestation processes. He was one of the wealthiest financiers of New Jersey.

DUDLEY, EDGAR SWARTWOUT. An American army officer and educator, died January 9, 1911. He was born at Oppenheim, N. Y., in 1845, and graduated from the United States Military Academy in 1870. He was made first-lieutenant in 1875, captain and assistant quartermaster in 1892, major and judge advocate in 1901, and colonel and judge advocate in 1903. He was promoted to be brigadier-general, and retired at the age limit in 1909. From 1876 to 1879 he was professor of military science and tactics at the University of Nebraska and also from 1884 to 1888. He was lieutenant-colonel of United States volunteers and judge advocate for the Division of Cuba from December, 1898, to May, 1901. At the same time he acted as legal adviser in the civil and military affairs to the military governors of Cuba. From 1901 to the time of his retirement he was professor of law in the United States Military Academy. He was the author of *Military Law* and *The Procedure of Courts-Martial* (1907).

DUDLEY, IRVING BEDELL. An American diplomat, ambassador to Brazil, died November 27, 1911. He was born at Jefferson, Ohio, in 1861, and graduated from Kenyon College in 1882. After studying law at Columbian (now George Washington) University, he was admitted to the bar in 1885. He practiced in San Diego, Cal., and from 1891 to 1895 was judge of the city court of that city. In 1896 he was a member of the Republican State executive committee of California. He was appointed minister to Peru in 1897, serving until 1906. In that year he was transferred to Brazil with the rank of ambassador.

DUDLEY, WILLIAM RUSSELL. An American botanist, died June, 1911. He was born in Guilford, Conn., in 1849, and graduated at Cornell University in 1874, and from the Medical School in 1876. He studied natural history in the Agassiz School, Penikese Island, Mass., in 1874. He was instructor in botany at Cornell University from 1873 to 1876 and assistant professor from 1876 to 1883. In 1887-8 he studied at the universities of Strassburg and Berlin. In 1883 he was appointed assistant professor in charge of cryptogamic botany at Cornell University, holding this position until 1892. In the latter year he became professor

of botany at Leland Stanford Junior University. He was the author of *The Cayuga Flora* (1886), *Lackawanna and Wyoming Flora* (1887) and *Manual of Histology* (with Professor M. B. Thomas, 1894).

DURHAM, MILTON JAMISON. An American lawyer and public official, died February 12, 1911. He was born in Mercer, Ky., in 1824, and graduated from Asbury (now De Pauw) University in 1844. He studied law at the Louisville Law School and was admitted to the bar in 1850. In 1861-2 he was judge of the circuit court. He was elected to Congress in 1873 and served in the Forty-third, Forty-fourth and Forty-fifth congresses. In 1885 he was appointed Comptroller of the Treasury by President Cleveland.

Ball and Lombok.....	10,522	523,535
New Guinea to 141° E. long	394,789	240,000
Total 1905	1,915,417*	37,957,400

* 759,543 sq. miles.

Principal towns of Java: Batavia (the capital), with 138,551 inhabitants; Surabaya, 150,198; Samarang, 96,600. Of Sumatra, Palembang, 60,985; of Borneo, Banjarmasin, 16,708; of Celebes, Macassar, 26,145. Primary schools (1908) for Europeans, 230, with 26,790 pupils; for natives, 981 in Java and Madura, with 145,844 (1908 figures for other possessions not available; in 1907, 1530 schools with 132,385 pupils). Secondary European schools (1908), 9, with 2160 students; normal, 2, with 65. Normal native, 5, with 454 students. Schools for sons of native chiefs, 4, with 434 pupils.

PRODUCTION. Total area under cultivation by natives in Java and Madura in 1908, 4,449,694 backus (1 backu=1½ acres); 1907, 4,288,031; 1906, 4,213,460. Cattle in Java and Madura in 1900, 5,509,240; in all the possessions (1905), 6,219,881. Agricultural and mineral productions for three successive years are given as follows:

Products	1906	1907	1908
Sugar (Java)*	16,041,197	17,854,957	18,718,325
Coffee*	523,000	271,000	327,170
Cinchona†	5,972,550	9,008,730	8,030,171
Tobacco†	52,180,933	60,183,212	53,856,320
Tea (Java)†	11,961,710	11,494,665	15,196,894

(Borneo)§	3,800	4,100	3,200
Copper, etc†	3,600	28,700	45,892
Manganese†	1,500	4,500	1,200

* In piculs. † Kilograms. ‡ Tons. †† Thousands of liters. § Carats.

The government tin mines (at Banca) employed, in 1909, 19,134 operatives and produced 204,191 piculs; private tin mines, 12,777 operatives, 73,557 piculs.

COMMERCE AND COMMUNICATIONS. Imports and exports were valued in 1909 at 281,637,000 and 455,094,000 guilders respectively (1 guilder = 40.2 cents), against 280,562,000 and 470,714,000 in 1908. Vessels entered (1909) 7898, of 10,696,000 cubic meters capacity. Railways in operation (1908), 3198 miles (2623 in Java, 575 in Sumatra); of telegraph, 8800. Telegraph offices, 569; post offices, 1882.

FINANCE AND GOVERNMENT. Revenue and expenditure for two years and the budget for 1911 are given as follows in thousands of guilders:

	1908	1909	1911
Revenue	189,511	181,540	214,610
Expenditure	191,083	193,939	239,017

Colonial army (January 1, 1909), 35,208 officers and men; effective navy, 17 vessels, aggregating 23,159 tons. Governor-general (1911), A. W. F. Idenburg.

DUTCH GUIANA, or SURINAM. A Netherlands colony on the northern coast of South America. Area, between 46,000 and 49,000 sq. miles. Population (exclusive of negroes in the forest tracts) in 1909, 82,739. Capital, Paramaribo, with 34,795 inhabitants. Schools (1908), 63, with 8464 pupils. Production of sugar (1908), 11,999,241 kilograms; cacao, 1,409,761; coffee, 502,900; rice, 1,686,670; corn, 812,059; bananas, 447,585 bunches; rum, 936,769 liters; molasses, 145,954 liters. Imports (1908), 7,036,847 guilders (1 guilder=40.2 cents); exports, 6,033,369; (gold, 1,674,021). Vessels entered, 234, of 202,214 tons; cleared, 235, of 201,757. Local revenue (1910), 5,815,588 guilders; expenditure, 6,738,174; subvention, 922,586. Governor (1911), R. D. Fock.

DWIGHT, THOMAS. An American anatomist and educator, died September 8, 1911. He was born in Boston in 1843, and graduated from Harvard College in 1866. He studied medicine at the Harvard Medical School, graduating in 1867. After studying for two years abroad he became instructor in comparative anatomy at Harvard, remaining there for one year, when he became lecturer and professor of anatomy at Bowdoin College. He was later in succession

instructor in histology, topographical anatomy, and Parkman professor of anatomy at Harvard. In the latter position he succeeded Dr. Oliver Wendell Holmes in 1883. From 1873 to 1878 he was editor of the *Boston Medical Journal*. In 1884 he delivered a course of lectures in the Lowell Institute of Boston on *Mechanism of the Bone and Muscle*. He was a prolific writer, especially for the medical press. His principal works are *Anatomy of the Head* (1876), *Frozen Sections of a Child* (1881), and *Variations of the Bones of the Hand and Foot* (1907). He contributed to Piersol's *Human Anatomy* (1907), and wrote various papers on human and vertebrate anatomy. Dr. Dwight was one of the leading Catholic laymen of Boston and he was chosen president of the Association of Catholic Physicians and Surgeons, formed in 1910 under the title "The Guild of St. Luke."

DYNAMICAL GEOLOGY. See GEOLOGY.

DYNAMO-ELECTRIC MACHINERY. The developments in electrical machinery during 1911 followed closely the precedents set during 1909 and 1910. The development of the turbo-generator has continued to be the most notable feature. It is estimated that the units of this type now in service exceed an aggregate capacity of 15,000,000 horsepower. The recent types have been designed for very much higher speeds than were previously employed with distinct gains in efficiency and reductions in first cost. Units up to 4000 kw. are now built to run at 3600 revolutions per minute, and larger sizes up to 10,000 kw. at 1500 and 1800 revolutions per minute. The 20,000 kw. machines installed during the year have shown an excellent performance. Earlier units were wound for direct connection to the bus-bars at voltages from 6600 to 13,200, but the present practice is to wind the machines for half the bus-bar potential and make the connection through a step-up compensator of special design. This arrangement gives the new units a greatly increased choking effect on the enormous currents which tend to develop at a short circuit and makes the control of the unit by an oil circuit breaker entirely reliable, as was demonstrated by an exceptionally severe series of tests conducted on a 12,000 kw. machine. These tests also pointed the way to improvements in the internal arrangement of oil circuit breakers which added much to their effectiveness.

Advances of note have been made in the construction of rotary converters. The use of commutating poles raised the safe limit of voltage per commutator segment and led to the development of successful machines for 1500 volts on the direct current side. A new record of capacity was reached in a 6-phase, 600-volt unit of 300 kilowatts. The development of a satisfactory type of single phase converter met a long-felt want. A new type of direct current generator has been designed on the split-pole principle, an auxiliary brush being used to fix the neutral point for three-wire service. This type of machine also serves effectively as a voltage balancer or as a voltage converter.

Several types of small single-phase motors for constant and adjustable speed service were placed on the market and were well received. In general these have a rotor of double winding, the greater portion of the power being developed in a squirrel-cage winding acting as an induction motor. With this is associated a commutator winding with auxiliary brushes and

connections to control the speed and correct the power factor to a leading value. Commercial forms of variable speed 3-phase induction motor were developed. These are generally provided with distributed stator windings whose connections can be altered to give different numbers of poles.

Transformers designed for 750,000 volts were built for experimental and testing purposes and safely developed 900,000 volts in service. The production of small motors for industrial, vehicle, and domestic service was unprecedented.

EARLE, ALICE (MORSE). An American author, died February 16, 1911. She was born at Worcester, Mass., in 1853, and was educated at the Worcester High School. In 1874 she married Henry Earle of Brooklyn, N. Y. She was the author of many volumes, among them the following: *Sabbath in Puritan New England* (1891); *China Collecting in America* (1892); *Customs and Fashions in Old New England* (1893); *Life of Margaret Winthrop* (1894); *Colonial Days in Old New York* (1897); *Curious Punishments of Bygone Days* (1897); *Home Life in Colonial Days* (1898); *Child Life in Colonial Days* (1899), and *Stage Coach and Tavern Days* (1900). She was also joint author of *Early Prose and Verse* (1893); *Historic New York* (1897); *Old Time Gardens* (1901); *Sundials and Roses of Yesterday* (1902), and *Two Centuries of Custom in America* (1903). She also contributed to various magazines and journals.

EARTH, HISTORY OF. See GEOLOGY.

EARTHQUAKES. There were few destructive earthquakes during 1911, although minor shocks were registered frequently by seismographic stations in the United States and elsewhere. For the last three years most countries have enjoyed respite from disasters of the kind that befell San Francisco, Kingston, and Messina in the period from 1906 to 1908. An exception to this general statement should be noted in respect to the cordilleran region of Mexico and Central America, where violent disturbances have lately taken place, the most notable of which have been the Costa Rican earthquake that destroyed Cartago and the one in southern Mexico on June 7, 1910.

The recent Mexican disturbance devastated a large area in the states of Jalisco, Colima, and Michoacán, and was sharply felt in the city of Mexico where it involved a property loss of \$500,000 and sixty-three fatalities. The collapse of the artillery barracks was responsible for most of the deaths in that city. Altogether 1300 people were reported to have perished, most of them were in the towns of Zapotán, Tuxpan, Colima, and Guzmán on the Pacific slope. The centre of the disturbance apparently was around the volcano Colima which coincidentally broke into eruption. The cordilleran section of Alaska was shaken on September 21 by an earthquake that displayed its greatest energy in the vicinity of Prince William Sound and caused extensive landslides and avalanches. Repeated shocks were felt in Ecuador on and about October 3. In the eastern hemisphere the most formidable disturbance of the year was reported on January 4 from the territory of Sennryetchensk, Russian Turkestan. It partly destroyed the capital city Vyerny, but the losses were not definitely stated. A fairly heavy shock on February 20 damaged Monastir, Macedonia.

Switzerland and southern Germany were visited by the severest earthquake in many years on November 16; the zone of maximum intensity was in the Central Alps, but the tremors were quite noticeable as far north as Stuttgart and Frankfurt.

SEISMOLOGY. The scientific study of earthquake phenomena has been pursued with vigor in the last few years. An indication of the wide interest it has awakened may be found in the establishment of observation stations in all parts of the world, which are now conducting an active campaign of investigation, and in the organization of societies devoted to its encouragement. An American seismological society which issues a periodical publication has recently been formed. One of the important developments that has resulted has been the perfecting of the seismograph on which our knowledge of wave motions set up by earthquakes and of their propagation is principally based. The general principles of this instrument are, of course, not new. Some form of the pendulum, either horizontal or inverted, is still generally employed to secure the necessary steady point, to which the apparatus for mechanical registration of the motion is attached. Without entering upon details it may be said that the recent improvements have been in the direction of increasing the inertia of the pendulum and further eliminating the element of responsive movement by the application of a damping device that automatically brings the pendulum to a state of rest. In this way a more faithful representation of the actual earth waves is secured. The recent types of instrument also show increased sensitiveness, a very desirable feature in the registration of distant or slight shocks. As an illustration of their delicacy Dr. Hecker of the Strassburg station has reported that he has been able to detect the existence of diurnal movements in the earth's crust that apparently correspond with the luna tides at sea.

Observations of the Messina earthquake of December 28, 1908, have been compiled by G. B. Rizzo, who obtained records from a total of 110 stations distributed over the earth as far distant as 18,000 kilometers from the source. In comparing the rate of travel of the different parts or phases of wave motion he found that up to a distance of 1500 kilometers all phases have a constant velocity. From that point the early or preliminary waves show a marked increase in velocity, which is not shared by the other phases. It would appear from this that the waves in the first part of their travels pass through the crust. The thickness of the crust is estimated from the data at forty-four kilometers.

ECCLESTON, JAMES HUSTON. An American Protestant Episcopal clergyman, died April 1, 1911. He was born in Chestertown, Md., in 1837, and graduated from Princeton College in 1856. He studied theology at the Protestant Episcopal Divinity School in West Philadelphia. He was ordained a priest in 1866, and became rector of St. Matthew's and later of the Church of the Saviour, Philadelphia. In 1875 he was elected bishop of Iowa, but the election was disputed and he declined the office. In 1877 he was elected bishop of West Virginia, but he also declined to serve in this position. He was defeated as candidate for bishop of Maryland by a small majority. Bishop Paret (q. v.)

was his successful competitor. In 1898 he was elected dean of the Theological Seminary of Virginia, but declined to accept this office. He was many times chosen as a delegate to the general convention of the church. In that body he was regarded as one of the leading authorities on canon law. His ability at drafting the final decrees of the convention was recognized and for many years he was chairman of the committee on canons of the general convention. From 1884 to the time of his death he was president of the standing committee of the diocese of Maryland and rector of Emmanuel Church, Baltimore.

ECLIPSE. See **ASTRONOMY.**

ECONOMIC ASSOCIATION, AMERICAN. A learned society, founded in 1885, for the purpose of encouraging economic studies and the publication of papers on subjects related thereto. Annual meetings are held in different cities of the United States. The meeting in 1911 was held at Baltimore, December 27-30. In conjunction with the meeting of the Economic Association, were held meetings of the American Statistical Association, the American Sociological Society, and the American Association for Labor Legislation. Joint meetings of these societies have been customary for several years. The programme of the American Economic Association included joint sessions with all of these associations. A feature of the meeting was the participation in its deliberations of a number of economists in the service of the government. Among these were E. Dana Durand, director of the census, Commissioner Neill of the bureau of labor, Chairman Emery of the tariff board, and Mr. Andrew, assistant secretary of the treasury. President Taft was the guest of honor of the association. Secretary MacVeagh presided at one of the sessions, and Secretary Fisher at another. The sessions were devoted almost entirely to economic questions of current political importance. The presidential address, delivered by Prof. Henry W. Farnam, was entitled *The Economic Utilization of History*. In this he maintained the value of experiment as a means of extending economic knowledge. The session devoted to the tariff was especially noteworthy. A paper was read by Chairman Emery of the tariff board in which he gave it as his opinion that the cost of production at home and abroad of protected commodities might be ascertained with sufficient exactness to serve as a guide to tariff-makers. Prof. H. Parker Willis of George Washington University combated this assertion. Several papers bearing on rural conditions were read. Among these was one discussing problems of Southern agriculture by Dr. John L. Coulter, one on the *Decline of the Rural Population of the United States* by Prof. B. H. Hibbard, of the Iowa State Agricultural College, and several others. In the session devoted to immigration an important paper was ready by Prof. H. P. Fairchild of Yale University. This dealt chiefly with the question of restriction. W. W. Husband, secretary of the immigration commission, gave a careful study of the extent and character of the emigration from the United States to Canada. The final session of the meeting was devoted to *Safety and Health in the Mining Industry*. The principal papers were read by John Mitchell, S. C. Hotchkiss, of the United States public health and marine hospital service, J.

A. Holmes, director of the United States bureau of mines, and J. R. Haynes. A large increase in membership was reported. It now amounts to about 2300. Prof. Frank A. Fetter of Princeton University was elected president for 1912, and Prof. T. N. Carver was reelected secretary-treasurer.

ECUADOR. A South American republic between Colombia and Peru. Capital, Quito.

AREA AND POPULATION. Estimated area of the 16 provinces, 116,000 sq. miles; estimated population (1910), 1,500,000. Galapagos islands; Area, 2400 sq. miles; population, about 500. Larger towns, with estimated population: Quito, 80,000; Guayaquil, 75,000; Cuenca, 40,000; Riobamba, 18,000.

In 1911 the number of public primary schools, instruction in which is free, was reported at 1197, with 92,947 pupils enrolled; in addition 152 municipal and 302 private primary schools. There are several institutions for secondary, higher, and professional education. The established religion is Roman Catholicism.

INDUSTRIES. The people are occupied chiefly in agriculture. The staple product is cacao, Ecuador being one of the principal sources of this article. Coffee, rice, and sugar-cane are cultivated. Valuable minerals exist, but have been little exploited. A few manufactories are established in Quito and Guayaquil. The most important manufacturing industry is the plaiting of Panama hats.

COMMERCE. Imports and exports, in thousands of sucres, have been valued as follows:

	1906	1907	1908	1909	1910
Imports	17,012	19,670	20,555	18,704	16,048
Exports	21,965	22,907	26,559	24,879	27,333

Leading imports in 1909 and 1910: Textiles (except silk), 5,522,578 and 3,440,992 sucres respectively; foodstuffs, 2,264,400 and 2,573,106; hardware, 1,138,788 and 1,096,620; machinery, 919,454 and 701,206; clothing, 640,738 and 495,758; liquors, 640,548 and 701,004; specie, 1,745,656 and 2,009,938. Principal exports in 1909 and 1910: Cacao, 14,522,418 and 15,792,114 sucres; vegetable ivory, 3,061,992 and 3,338,758; Panama hats, 2,317,146 and 2,517,150; rubber, 1,540,668 and 2,012,190; coffee, 1,056,948 and 1,471,384; gold (metal and ore), 548,736 and 498,358; hides, 452,778 and 514,506; specie, 851,270 and 720,000.

*Trade by countries, in thousands of sucres:

	Imports		Exports	
	1909	1910	1909	1910
Great Britain	6,300	4,968	2,501	2,282
United States	4,796	4,509	6,832	8,181
Germany	3,347	3,148	3,156	4,496
France	1,221	1,053	8,922	9,588
Italy	922	674	458	301
Belgium	875	652
Spain	663	544	585	801
Peru	226	120	321	144
Chile	203	108	806	768
Austria-Hungary	271	219
Other	151	272	1,027	573
Total	18,704	16,048	24,879	27,333

During 1910 foreign vessels entered at Guayaquil numbered 213 steam and 5 sail, with registered tonnage 402,582, nearly half British.

COMMUNICATIONS. Early in 1911 about 350

miles of railway were in operation, of which the Guayaquil-Quito line comprised 297 miles. The line from the port of Bahia de Caraquez to Quito, the capital, which was begun in July, 1909, was under construction in 1911, and was completed as far as Calceta, a distance of 34 miles. On June 30 of that year the line from Manta to Santa Ana was begun. The telegraph system is reported at 2608 miles, with over 60 offices.

FINANCE. The monetary unit is the sucre, worth one-tenth of a sovereign, 48,665 cents. Revenue and expenditure, in thousands of sucres:

	1906	1907	1908	1909	1910
Revenue	12,188	12,725	13,362	15,878	15,117
Expenditure	13,237	15,402	12,765	15,565	15,479

Customs receipts in 1910, 10,799,198 sucres. Total net debt, June 30, 1910, 43,511,024 sucres. A loan of 3,000,000 sucres was negotiated in January, 1911.

ARMY. A small standing army is maintained under the law of 1902, which requires obligatory military service from all citizens between the ages of 20 and 45, namely, 1 year in the permanent army, 10 years in the first reserve, and 15 years in the second reserve. This law has not been executed, but, beginning with 1910, there was being formed a first reserve. According to the most recent returns for 1910 the permanent army consisted of 13 battalions of infantry, 7 squadrons of cavalry, 2 squadrons of mounted batteries, 3 regiments of artillery, 1 battalion of engineers, 1 mine and troop section, and 1 regiment of coast artillery. The total number of officers was given at 3546, and the non-commissioned officers and men at less than 10,000. At the beginning of the year 1910 there was in course of formation a reserve of men between the ages of 18 and 30 to comprise 135 battalions of infantry, 7 regiments of artillery, 44 squadrons of cavalry, 1 corps of engineers, 1 battalion of marines, or a total of about 26,000 men. At the same time, a second reserve was contemplated to take men between the ages of 31 and 50, to include 81 battalions of infantry, 4 regiments of artillery, 26 squadrons of cavalry, 2 battalions of engineers, and 12 companies of marines and soldiers, or a total of about 18,000 men.

NAVY. There are reported one destroyer, one torpedo boat, three launches, one transport, and an auxiliary vessel.

GOVERNMENT. Under the constitution of December 23, 1906, the executive authority is vested in a president, elected by direct vote for four years and assisted by a cabinet of five members. The Congress consists of the Senate (32 members) and the House of Representatives (48). Gen. Eloy Alfaro was succeeded as president by Emilio Estrada for the term beginning August 31, 1911. Estrada died December 21, 1911, and Carlos Freile, president of the Senate, became acting president. Political unrest was immediately manifest, and at the end of the year an insurrection, headed apparently by friends of General Alfaro, was in progress, and General Montero was proclaimed president by the army.

On the report that the United States was to lease the Galapagos islands for a term of ninety-nine years, mobs gathered at Guayaquil

on January 27, hooted the president and stoned his house. The lease was not granted.

EDISON NICKEL IRON BATTERY. See **ELECTRIC BATTERIES.**

EDSON, JARVIS BONESTEEL. An American engineer and inventor, died January 26, 1911. He was born at Janesville, Wis., in 1845, and graduated from New York University. He enlisted in the Twenty-third New York Infantry in June, 1863, and served for the remainder of the war. After its close he saw service for three years in the navy. Returning to civil life he invented and patented a steam gauge, a method for drying gun cotton by compressed air at normal temperature, a method of sinking deep wells in clay, quicksand, etc., and many other engineering devices.

EDUCATION IN THE UNITED STATES.

STATISTICS. Preliminary statistics from the commissioner's report for 1911 show that during 1910 there were enrolled in the public schools 17,813,852 pupils, and in private schools 1,634,066. About 95 per cent. of the pupils were in the elementary schools; 340,628 are receiving higher instruction (of whom 88,561 are in normal schools). The average length of term was 157.5 days, an increase of two for the year. There were 523,210 public school teachers, of whom 26.8 per cent. were men. The value of school property was \$1,091,007,512. The public schools spent \$426,250,434, of which 1.6 per cent. was for general professional and business control, 59.4 per cent. for salaries of teachers, 1.5 per cent. for text-books and other instruction expenditures, 16.6 per cent. for buildings, sites, equipment, etc., and 21.9 per cent. for miscellaneous purposes. It cost about \$33 per pupil based on an average attendance or \$4.63 per capita of total population.

ADMINISTRATION AND PUBLIC EDUCATION. In July Dr. Elmer E. Brown resigned the office of United States Commissioner of Education and Dr. P. P. Claxton was appointed to the position. Plans which have for their purpose a large extension of the duties of the bureau are before the appropriation committees of Congress.

The number of pupils who are unable to keep up with their grades and who leave school at the earliest opportunity has continued to arouse lively discussions. In October, the United States Bureau of Education published a bulletin entitled, "An Age-Grade Census of Schools and Colleges," by George D. Strayer. This work presents the situation as found in 218 cities. It shows that only 36 or 40 per cent. of the boys and 46 or 50 per cent. of the girls who enter the public schools reach the first year of the high school, while only 10 to 12 per cent. of the boys and 18 to 20 per cent. of the girls complete the high school course.

The agitation over retardation and elimination has led school officials to consider the situation in their schools and to seek a remedy. The importance of some efficient system of keeping school records has been emphasized. Until 1907 not more than twenty-five cities published any data bearing on the ages and grades of pupils. Now a complete age and grade census may be found in the reports of more than one-half of the cities, and a committee of the Department of Superintendence is working on a system of record cards which will make it possible readily to trace the progress of pupils.

In January, the board of commissioners in

the city of Baltimore adopted a resolution directing a committee to employ a commission of three disinterested and competent persons to investigate and report on the system of instruction in the public schools of the city. The committee employed Elmer Ellsworth Brown, at that time United States Commissioner of Education, as chairman; E. P. Cubberly professor of theory and history of education in the Leland Stanford Junior University; and Calvin N. Kendall, then superintendent of schools at Indianapolis. The members of this commission and their assistants spent several weeks in studying the conditions existing in the schools, and submitted a report in the form of a bulletin published by the United States Bureau of Education. This report has been helpful not alone to Baltimore, but to cities in general in that it makes an attempt to indicate the lines along which such investigations may be conducted.

The Board of Estimate of the City of New York which controls the expenditures of the various departments of the city decided to determine if possible what relation exists between expenditures and efficiency in the city schools. For this purpose the sum of \$50,000 was appropriated. In June, Dr. Paul H. Hanus, professor of the history and art of teaching in Harvard University, was secured as chairman of a committee of inquiry. He associated with himself a number of experts in the different fields of education. The investigation was begun with the expectation of completing it by January 1, but the magnitude of the undertaking led the Board of Estimate to make a second appropriation in order that the work might be continued until July 1, 1912.

Much discussion was occasioned by the sections of the proposed charter for New York City which called for a paid board of education consisting of seven members who were to devote all their time to the duties of this office. In general this plan was opposed by all educational authorities on the ground that "it is not the business of a board of education to manage the schools in detail, but simply to supervise and control the administration of the schools by the expert officials in charge, to select these experts, and to represent public opinion in matters relating to tax-supported education." It was claimed that in cities where this plan is in operation, men of inferior professional ability are placed over the real professional heads of the school system.

In the administration of State school systems the most noteworthy event of the year was Governor Wilson's appointment of Calvin N. Kendall, formerly superintendent of the Indianapolis schools, as Commissioner of Education of New Jersey. The office was created by the last legislature, and carries with it the largest salary paid to any American State school officer.

EDUCATIONAL LEGISLATION. The legislatures of 43 States met in 1911. A large number of educational measures were considered and some important laws passed. Pennsylvania replaced two hundred general laws and about two thousand special acts by a new school code which provides, among other things, a State board of education, a new arrangement of districts according to population, and the gradual acquisition by the State of the thirteen normal schools.

Idaho, Nevada, and North Dakota also passed new codes, and South Dakota and Tennessee considered new school laws, but failed to pass

them. The legislature of New Jersey enacted a law which provides for a non-partisan board of education consisting of eight members, and elected for eight years, and for a commissioner of education to be appointed by the governor.

The legislation of 1911 showed a marked tendency to increase the powers of the State boards of education and to provide for more adequate State supervision.

HEALTH PROVISIONS FOR PUBLIC SCHOOL CHILDREN. Since 1890 there has been a noteworthy increase in provisions for conserving the health of school children. The most progressive States in this particular are those of the western and north Atlantic sections. So long as activity was confined to the detection of contagious diseases, it was largely a function of the board of health, but now that the aim includes the general physical improvement of pupils the work is often administered by the board of education.

Teachers often conduct the tests for hearing and seeing, but doctors and nurses conduct the other physical examinations. The school dentist has lately been employed in some places. The usual procedure is to examine the child and in case defects are found, parents are notified and urged to consult their family physician. If the school employs nurses, they follow up the case and aim to see that the child receives the proper treatment.

Dr. Leonard P. Ayres, associate director of the Department of Child Hygiene, Russell Sage Foundation, gives the following summary of the status of medical inspection: "At the present time (May, 1911), seven States have mandatory laws, ten have permissive ones, and in two States and the District of Columbia medical inspection is carried on under the regulations promulgated by the boards of health and having the force of laws."

Medical inspection is but one of several agencies employed in improving and protecting the health of pupils. Public sentiment has become thoroughly aroused over the dangers connected with the common drinking cup, and it is now prohibited by law in the schools of many States. Recesses in the open air are provided in most schools. The feather duster and dry dust cloth are giving way to more hygienic methods. States are insisting on suitable ventilating systems in properly arranged buildings which must be erected in healthful places. A recent development is the open air class. Such classes are often located on the roofs of city schools. A tentlike arrangement of canvas protects from rain, and in case of a disagreeable wind a side may be lowered. The desks are set on individual platforms which are movable. The children are protected from the cold by warm coats, toboggan caps, gloves, and some form of sitting-out bag; warm lunches are usually provided. Although such classes were designed for tubercular children, and even now are largely confined to those who are not healthy, the physical and mental vigor of the pupils attending such classes is leading many officials to consider the advisability of opening them to normal children.

INDUSTRIAL EDUCATION. Training for the vocations continues to be a topic of absorbing interest. The Chicago Chamber of Commerce sent Edwin G. Cooley, ex-superintendent of the Chicago schools, to study and report upon the various phases of vocational training in Germany. The New York Chamber of Commerce

appointed a committee to investigate the possibilities of commercial education in the public schools of the city. These actions are indicative of the earnest attention this matter is receiving from the public. The results of the experiments which have extended over the last six years have been studied and there is coming to be a better understanding of the difficulties involved in vocational training. The twenty-fifth annual report of the Commission of Labor which appeared in November is devoted to a comprehensive review of the industrial educational situation. In thirty States laws have been enacted which encourage and in most cases assist communities in maintaining vocational instruction.

There continues to be much diversity and confusion in the use of terms. The executive committee of the National Society for the Promotion of Industrial Education decided upon the following definitions:

Vocational Education includes all forms of specialized education, the controlling purposes of which are to fit for useful occupations.

Industrial Education denotes the field of vocational education designed to meet the needs of the manual worker in the trades and industries, including the occupation of girls and women carried on in workshops.

Agricultural Education is that form of vocational education which fits for the occupations connected with the tillage of the soil, the care of domestic animals, forestry, and other useful works on the farm.

Household Arts Education is that form of vocational education which fits for occupations connected with the household.

The report of the United States Commissioner of Education for the year 1908-09 shows that one hundred forty-two schools were giving complete trade training, preapprentice instruction, or supplementary instruction to those engaged in industrial pursuits. This number does not include fifty-three similar institutions for the colored race and fourteen for the Indians. The report further shows that in the two hundred sixty-five cities from which reports were received, 110,653 pupils were receiving some form of manual or vocational instruction. More than one-half of the cities having populations of four thousand or more provide manual training in some grades and often throughout the elementary and high-school courses. More than seventy different types of industrial activities are conducted in the schools. Joinery, pattern making, and machine shop practice are the most common subjects for boys, and sewing, cooking, and millinery for girls.

The training of teachers for the industrial subjects, and the methods of conducting the work have each received increased attention during 1911. New York began the training of teachers for vocational subjects in three normal schools. In one of these schools an evening course is maintained for mechanics who desire to fit themselves for teaching. The legislature of Massachusetts provided for an investigation of the possibilities of part-time instruction in the vocational subjects. Wisconsin started a vocational normal school, and acts passed by the last legislature make it possible for the public schools to provide certain vocational subjects and to compel apprentices to attend part-time.

MONTESORI SYSTEM. Reports of results ob-

tained by Mme. Maria Montessori in the case *dei bambini* (houses of childhood) in Rome have created great interest in her system for training young children. Few people have approached the problem of education with as complete a preparation as has Madame Montessori. After earning the degree of doctor of medicine at the University of Rome she became assistant doctor of the clinic of psychiatry. Her clear conception of the needs of the mentally deficient attracted the attention of prominent people and in 1908 the *Scuola Ortofrenica* or "mind-straightening school" was established with Madame Montessori as its director. In this institution were gathered all the feeble-minded children from the city asylums. So successful was the instruction that these children became mentally as efficient in many respects as normal children. These results were secured by aiding the child in his psychic development. In 1900 Madame Montessori left this school and began the study of experimental psychology in the University of Rome. This work put her in direct touch with educational practice. In 1906 she was made director of a series of infant schools located in certain blocks inhabited by poor penants. These *case dei bambini* are part of an organized system for social improvement. Teachers live in the school buildings, and a close relationship exists between the schools and the homes surrounding them. The methods employed in these schools are the direct outcome of the experience gained with the feeble-minded.

The essentials of the system may be grouped about several points which are suggested by their similarity or dissimilarity to common practice. Madame Montessori goes further even than Froebel in urging freedom for the child. There is an entire absence of all the furniture and formal arrangements that usually characterize a schoolroom. Children move about with entire freedom. As a result a real social attitude exists. Teachers are admonished to follow the manifestations of the child. This admonition has a twofold purpose. It emphasizes the principle of self-activity on the part of the child, and at the same time it puts the teacher in the proper attitude to understand the normal course of development. In practice, the system does prescribe, though not to the same extent as ordinary primary methods.

In no other system has there been such direct, systematic, even formal training of the senses. The character and extent of this training can best be understood by considering a few type exercises. Two pieces of cardboard, one of which is smooth, the other covered with sandpaper, are placed before the child. The child's fingers are passed over these surfaces and the associations "rough" and "smooth" are thus established. Different shaped insets are given to blind-folded children and they distinguish their forms and place them properly by passing the finger around the margins and thus gaining a sense impression. Bobbins are wound with silk of different colors and shades, and the children arrange the colors in order and also the shades under each color. Two pieces of cloth are fastened to opposite sides of a frame. One piece has buttons, the other button-holes, and the child learns with this to button and unbutton. The letters are taught by means of pasteboard cards on which are pasted the letters cut from fine sandpaper. Exercises such as these are numerous. A complete set of appa-

tus for a class of twenty or twenty-five pupils consists of about eleven hundred pieces.

Madame Montessori believes that the child's imagination needs little or no stimulation. She employs no stories such as are used in kindergartens and primary grades and there is no symbolism.

Several schools employing this system have been started in and around New York. The experiment has not progressed far enough to determine whether the methods will prove as effective under our social conditions as they have proved in Rome.

An English translation of Madame Montessori's book, *Metodo della Pedagogia Scientifica*, is being edited by Prof. Henry W. Holmes of Harvard University.

PROVISIONS FOR EXCEPTIONAL CHILDREN IN SCHOOLS. Recently increased attention has been given to the care of exceptional children. As now used, the term exceptional children refers to such as cannot work most satisfactorily with the great majority of children. It includes those who are feeble-minded, morally defective, slow, or backward, as well as those who are especially talented. It does not include the small number of children who are so mentally deficient as to be proper institution cases. Provisions for these children take the form of special classes or of such an arrangement of the course of study in the regular public school that pupils are able to make as rapid progress as their ability permits. Typical classes of this sort are those for epileptics and the subnormal, disciplinary classes, ungraded classes in which only a few pupils are taught by one teacher, parental schools, etc. A newer development is classes for the exceptionally bright. In such classes the work of the seventh and eighth grades and the four high-school grades is done in five years.

Bulletin 1911, No. 14, by the United States Bureau of Education shows that of the 898 cities from which data were secured 17 per cent. made provision for morally exceptional children, 11 per cent. had classes for the mentally defective, 25 per cent. for backward children, while only 6 per cent. provided for the exceptionally gifted. Ten per cent. made provision for the physically exceptional children, including those that were blind, deaf, crippled, stammerers, etc. Thirty-nine per cent. provided for non-English-speaking children and those entering school late. In New Jersey all children three or more years behind their grade must be placed in special classes.

Among the plans designed to break the "lock-step" of common promotional systems, the ones most favored by educators are the "North Denver plan," which provides a minimum amount of work to be accomplished by all the pupils and supplementary work which may be done by the brighter ones; the "Cambridge plan," which so arranges the course of study that it may be completed in eight, nine, or ten years; and the "Pueblo plan," which is largely an individualistic plan of grading and promoting.

TEACHERS' PENSIONS. The pensioning of teachers in the common schools has been a development of the past eleven years. At first, attempts were made to provide retirement funds without resorting to salary deductions. Little was known concerning the longevity of teachers as a class, and as a result the early measures were more or less defective in that insufficient

revenues were derived. Rhode Island, Maryland, and New Jersey provide pensions from public funds. During 1911, eleven States took important steps to pension teachers in city public schools. There is some variation in the plans, but in general the retirement fund is largely derived from salary deductions or assessments of from 1 to 2 per cent., and teachers become eligible to pensions after thirty to thirty-five years of service.

TEACHERS' SALARIES. The average monthly salary of women teachers in 1908-9 was \$50.08 and of men \$63.39. Several States have raised the minimum pay of their teachers. Pennsylvania increased the minimum salary from \$40 to \$45. In Wisconsin no State aid can be given to any vocational school that does not pay every teacher at least \$60 per month. In Indiana, the minimum salary of teachers who are exempt from examination was increased one-sixth. The elementary school teachers of Boston conducted a campaign which will result in increases in their salaries. The most prominent legislation affecting teachers' salaries was the so-called "Equal Pay for Equal Work" act passed by the New York State legislature to apply to the teachers of New York City. Measures similar to this had failed in five successive legislatures. By the terms of this act the board of education has the right to fix the salaries of teachers, but there must be no discrimination on account of sex.

VOCATIONAL GUIDANCE. Until recently, pupils who left school at the age of fourteen or sixteen to become wage-earners did so with little or no knowledge of how to apply their energies to the best advantage. As a result, it was often several years before they found profitable positions. To avoid this period of waste, the demand has arisen for some means of acquainting both parents and pupils with the opportunities, risks, and advantages of the various occupations. This activity, under whatever form it is conducted, is called "vocational guidance." The attempt is made to reach the pupil during the later years of his school life and have him consider seriously the problem of a vocation.

Although the work is done in close connection with the school, vocational guidance is at present conducted almost entirely by voluntary organizations, of which the best known are the students' aid committee of the New York High School Teachers' Association and the Vocational Bureau of Boston. A conception of the character of this movement may be gained from an enumeration of some of the more important activities which are conducted in various cities. Vocational pamphlets have been prepared on such topics as, "Choosing a Career," "Opening for Boys in Machine Shops," "The Baker," "The Dressmaker," "The Architect," etc. Conferences are held with parents and pupils, and advice is given regarding the best preparation for any desired occupation. Employers are investigated and the results made available to those who desire such knowledge. Pupils are placed in situations and their proper training directed.

BIBLIOGRAPHY. Among the helpful educational books of the past year were, *A Brief Course in the Teaching Process*, by George D. Strayer; *Educational Values*, by William C. Bagley; *The Vocational Guidance of Youth*, by Meyer Bloomfield; *Educational Problems*, by G. Stanley Hall; *A Cyclopædia of Education*, edited by Paul Mon-

roe; *Industrial Education*, the twenty-fifth annual report of the United States Commissioner of Labor; *American Report of the International Commission on the Teaching of Mathematics*, published by the United States Bureau of Education in Bulletin 1911, Nos. 6, 7, 8, 9, 12, 13, and 16; *The Individual in the Making: A Subjective View of the Child, with Suggestions for Parents and Teachers*, by Edwin A. Kirkpatrick; *Agricultural Instruction in the Public High Schools of the United States*, by Clarence H. Robison; *History of Public Permanent Common School Funds in the United States, 1795-1905*, by Fletcher H. Swift; *Individuality*, by Edward L. Thorndike. See AGRICULTURAL EDUCATION.

EDUCATION, VOCATIONAL. See EDUCATION.

EDWARDS, JOHN PASSMORE. An English editor and philanthropist, died April 22, 1911. He was born in Cornwall in 1824. At the age of eighteen he went up to London and obtained a subordinate position in a publishing house. After ten years of this service, when he had accumulated a small sum of money, he set up business as a publisher on his own account. The business did not succeed and he was obliged to begin anew. After making some profits by conducting a scientific journal he paid his contributors in full. In 1876 he acquired the *Echo*, a half-penny paper. In this he at once began fighting for various reforms, particularly the prevention of gambling and horse-racing among the poorer people. He at the same time took an active interest in politics and from 1880 to 1885 occupied a seat in the House of Commons as a Liberal. He followed Mr. Gladstone until the introduction of the Home Rule bill. This he could not support. Before his retirement from Parliament in 1885 he had become a wealthy man, largely through the successful management of the *Echo*. Having made this large fortune he set himself to work to combat the two great enemies of the working classes, ignorance and disease. He made special efforts to render books and a technical education accessible to the greatest possible number. He also encouraged the extension of hospitals and convalescent homes. He founded a great number of Passmore Edwards Institutions, mostly in London and Cornwall. One of his last great gifts was the presentation of the Passmore Edwards Sailors' palace to the British and Foreign Sailors' Society for its headquarters. This building was opened in 1903. He was twice offered knighthood, but declined both times. A proposal was made that the city of London should make him an honorary freeman, but his attitude in respect to the Boer War made him so unpopular that the vote of the council went against him. His name is chiefly associated with free libraries, of which he founded twenty-five. He presented upwards of 30,000 volumes to public libraries, hospitals, convalescent homes, reading-rooms and other institutions. He was a delegate to many peace conferences, and was perhaps the most widely known English philanthropist at the time of his death.

EGGLESTON, GEORGE CARY. An American journalist and writer, died April, 1911. He was born in Vevay, Ind., in 1839, and was educated at Asbury (now De Pauw) University, and at Richmond College, Va. He practiced

law in Virginia until the outbreak of the Civil War, when he enlisted in the Confederate army and served until 1865. After the war he filled important newspaper positions in New York. He was for six years literary editor of the *Evening Post*, was editor-in-chief of *Hearth and Home*, and from 1884 to 1889 was editor of the *Com-American Advertiser*. From 1889 to 1900 he was an editorial writer for the *New York World*. He wrote many books for boys. Among his writings may be mentioned: *How to Educate Yourself* (1872); *Big Brother* (1875); *Camp Venture* (1901); *The Master of Warlock* (1903); *The First of the Hoosiers* (1903); *The Warrens of Virginia* (1908), and *Irene of the Mountains* (1909). In 1910 he published a volume of reminiscences entitled *Recollections of a Varied Life*. He edited Hayden's *Dictionary of Dates* and compiled *American War Ballads*.

EGYPT. A country of northeastern Africa, in effect a British dependency, though nominally under the suzerainty of Turkey. Capital, Cairo. Area, exclusive of Egyptian Sudan, about 400,000 sq. miles; population (1907), 11,189,978 (exclusive of nomadic Bedouins). Number of government inspected kuttabs (indigenous schools) in 1909, 3582; with 190,875 pupils; grant-in-aid, £E21,479. Estimated expenditure on elementary vernacular education in 1910, £E64,000. Schools other than kuttabs (1907-8), 735, with 113,430. There are secondary, special, and industrial establishments, and eleven professional colleges.

Mohammedans (1907), 10,366,826; Copts, 706,322; Greek Orthodox, 78,953; Roman Catholics, 57,744; Jews, 38,635; Eastern Christians, 27,937. The Mosque and University of El Azhar at Cairo had (1908) 329 professors and 9940 students; the Mosque of El Ahmadi at Tanta, 69 and 3607.

PRODUCTION, COMMERCE, ETC. Area (1909) under wheat, 1,249,264 feddans (1 feddan=1.038 acres); corn, 1,796,745; barley, 423,293; rice, 271,820; beans, 566,688; cotton, 1,597,055; sugar-cane, 43,982. Number of date-palms, 5,966,010. Sugar crop (1909), 4,530,270 kilograms (value, £E80,640); cotton, 6,751,133 cantars (1 cantar=44.9 kilograms).

The commerce for three years is given in pounds Egyptian (£E1=£4.943):

	1908	1909	1910
Imports, mdse.....	25,100,397	22,230,499	23,552,826
" specie....	4,205,083	7,010,196	12,964,245
Exports, mdse.....	21,815,673	26,076,239	28,944,461
" specie....	4,671,206	6,467,588	7,046,161

The principal articles of export were in 1910 cotton (£E24,242,000), cotton-seed (£E2,160,000), cigarettes (£E387,000), rice (£E288,000), oil-cake (£E283,000), onions (£E265,000), and hides (£E237,000). The principal countries of origin and destination follow, value in thousands of pounds Egyptian (1910):

	Imps.	Exps.		Imps.	Exps.
Gr. Brit....	7,309	14,343	Aus.-Hun.	1,647	1,435
Turkey	2,905	666	Ger.	1,262	3,083
Russia	2,773	1,680	Italy	1,169	825
France* ...	2,703	2,480	Belgium	871	79

* And Algeria.

Vessels entered (1910), 6586, of 5,425,314 tons; cleared, 6564, of 5,441,287.

Railway lines in operation (1911): 2904 kilometers state, 1228 kilometers private companies (see RAILWAYS, AFRICAN); telegraph lines 5913 kils., wires 20,503; offices 369; telephone lines 384 kilometers, wires 2088; post offices 1645.

ARMY. The Egyptian army was under command of a British officer with the title Sirdar—in 1911, Lieut.-Gen. Sir Reginald Wingate—who was also governor-general of the Sudan. One hundred and eighty-eight British officers were attached to the Egyptian army, which is formed by conscription, as all male inhabitants are liable for military service. The statutory period is 6 years in the army, 5 years in the police, and 4 years in the reserve, but as 150,000 young men are always available, the burden of military service is light, and recruits are carefully selected. The peace strength is about 9000 officers and men, while the effective war strength is about 18,000, including 800 cavalry, 600 in the camel corps, 200 arab battalions, 1250 in the artillery, and 10,000 infantry. The cavalry is recruited from the fellahen of the Delta, while the Sudanese battalions are recruited by voluntary service. The Egyptian artillery has been carefully trained by British officers, and is armed with Krupp guns, for both the field artillery and the mountain batteries, and the light batteries, some of which have Krupp guns carried by mules with a second line of camels. The British government in 1911 maintained in Egypt 1 cavalry regiment, 1 horse battery, 1 mountain battery, 1 company of royal engineers, 4 battalions of infantry, and 3 battalions of Coldstream Guards, and other details of troops, making a total number of 6063 officers and men under the command of Maj.-Gen. Sir J. G. Maxwell. To the maintenance of this force the Egyptian government contributed £150,000.

FINANCE AND GOVERNMENT. Revenue and expenditure for three years are given in pounds Egyptian (£E=£4.943):

	1908	1909	1910
Revenue	15,521,775	15,887,313	15,965,693
Expenditure	14,408,144	16,226,841	14,414,499

The budget estimate for 1911 is detailed as follows: Revenue, £E15,500,000 (direct taxes, £E5,565,000; other taxes and dues, £E5,246,000; receipts from revenue-earning administrations, £E3,727,000; etc.). Expenditure, £E15,000,000 (cost of administration, £E5,030,231; tribute and debt, £E4,596,154; expenses of revenue-earning administrations, £E2,503,097; defense, £E855,031; pensions £E550,000; Sudan deficit, £E360,000; etc.). Public debt (December, 1910), £89,201,060.

The practical administrative head of the government is the British agent, consul-general, and minister plenipotentiary (1911, Field Marshal Viscount Kitchener of Khartum). British financial adviser in 1911, H. P. Harvey. The khedive is Abbas Hilmi (since January 8, 1892). In him and in his ministers is vested also the final legislative power.

HISTORY. Considerable excitement was caused in January, 1911, by the sentence of the Nationalist leader, Mahomed Farid, to two months' imprisonment, for having written a laudatory preface to a volume of seditious poems. On March 6 the Coptic Congress met at Assiut to consider the grievances of the Copts, especially as to education and government appointments,

and it was decided to refer to the authorities the question of Coptic representation in the Legislative Council and provincial councils. As a counter demonstration against the Coptic congress it was decided to call an Egyptian Mussulman congress which would represent the views of the leading Mohammedans. At this congress, which was held on April 29, the Coptic grievances were dismissed as of no importance. In general, condition were more peaceful than in the preceding year. Sir Eldon Gorst reported in the spring of 1911 that since November, 1910, there was less difficulty with the Legislative Council than there has been, but at the same time he declared his opinion that co-operation with a native ministry was not at present compatible with the policy of "encouraging the development of so-called representative institutions." Sir Eldon Gorst's death on July 17 was a serious loss to the Egyptian administration. Lord Kitchener of Khartum was appointed his successor.

ELECTRICAL INDUSTRIES. Despite the fact that 1911 ranked as a dull year in business generally, the electrical industries maintained their normal rate of increase. The most reliable estimates available for the past two years are as follows:

	1910	1911
Electrical manufactures	\$ 300,000,000	\$ 325,000,000
Electric railway earnings	520,000,000	575,000,000
Central station earnings	300,000,000	375,000,000
Telephone earnings....	275,000,000	310,000,000
Telegraph earnings....	65,000,000	75,000,000
Isolated plant service..	100,000,000	125,000,000
Miscellaneous electric service	75,000,000	100,000,000
Total	\$1,635,000,000	\$1,885,000,000

ELECTRICAL POWER, TRANSMISSION OF. See **ELECTRIC POWER.**

ELECTRIC BATTERIES. The value of the storage batteries sold in America during 1911 exceeded by 50 per cent. the highest previous record, owing largely to the rapid development of the electric vehicle and of electric train lighting. This class of service demands a battery of large capacity per unit weight and capacity which is well sustained over a long period of life and severe service. These requirements have stimulated great activity in the development of new types of grid construction. Pasted plates have come into almost exclusive use. Practice tends to the use of a lattice framework with diamond-shaped apertures into which the active material is pressed. This results in a thin plate of large capacity and excellent retaining power. The envelope form of grid marks a radical departure from earlier standards. A successful representative of this class consists of a vertical row of conducting rods about which cylinders of active material are held in place by perforated containers of hard rubber, the grid being completed by con-

ducting top and bottom cross-bars. Exceptional length of life is claimed for this form of grid as the shedding of active material and consequent loss of capacity is prevented. The container is sufficiently flexible to allow the expansion of the active material without buckling or distortion.

The Edison nickel-iron battery has been an active competitor in the field of propulsive and portable batteries. Its chief advantages have proven to be its long life, ability to withstand severe electrical treatment, and light weight. Experience has brought to light a number of disadvantages of a serious nature. Its efficiency is much lower than that of the lead cell, due to its high internal resistance. Above a temperature of 40° Fahr. it is little affected by temperature changes, but below this point it quickly becomes inoperative. In some cases it has been necessary to instal heating coils in the containing box to maintain the necessary temperature when the battery stands idle.

A new and promising field for the storage battery has been opened in connection with the handling of baggage and package freight in railroad terminals. During 1911 a large number of battery-propelled trucks displaced hand-operated trucks, resulting in a great increase in handling capacity and a great reduction in cost. As compared with the electrical telferage system, the battery trucks are much more flexible and require little or no rearrangement of existing terminals. The use of battery-propelled street cars has increased notably. On one New York line alone sixty-five such cars are now equipped with Edison cells. This type of battery continues to enjoy a distinct pre-eminence in this field, due to its light weight and the rapid charging rate which it permits.

ELECTRIC LAMP TRUST. See **TRUSTS.**

ELECTRIC LIGHTING. The chief event in the field of electric lighting in 1911 was easily the commercial advent of the drawn-wire tungsten lamp, and the practical retirement of the pressed-filament lamp from the market. The advantages of the new lamp are almost entirely in the realm of greater durability in transportation and in service. The continuous filament of the new lamp requires more points of support than the former four and five loop types, and is therefore slightly less efficient. An immediate result of this step was the practical elimination of the tantalum lamp and a very great reduction in the sales of carbon lamps. The metallized carbon-filament lamp, however, made notable gains. Present indications point to the tungsten and metallized carbon lamps as the most fit survivors of recent evolution. Belgian manufacturers of tungsten lamps have developed an inclined and a horizontal mounting of the filament with a view to improving the downward light distribution. In America, however, the large development of efficient and attractive reflectors for the standard form of lamp have left little to be desired in the matter of light distribution.

Among the arc lamps the most important improvements have related to long-burning flaming arcs. For these long and heavily mineralized electrodes of large diameter are employed with a vertical mounting. Both electrodes are fed and the arc is maintained at a fixed level. A positive air circulation is provided which sweeps the fumes from the arc into a condensing chamber with a large cooling surface, thus pre-

venting the settling of dust upon the globe. A life per trim of 100 hours is readily obtained by this process. The light distribution is especially favorable for the illumination of wide spaces. This type of lamp is finding large favor for the lighting of broad streets and public squares.

The range of service afforded by the mercury arc was much extended by the light balancing reflectors of fluorescent material and the development of a combination unit consisting of a curved mercury tube and tungsten lamps in a diffusing bowl. The resulting light is considerably superior in efficiency and whiteness to that of the tungsten lamp. The quartz tube mercury arc, which had been developed in previous years in Germany, made its appearance in America during the year, and bids fair to be an active competitor with earlier types. It is much handicapped, however, by the high cost of the quartz tube.

Two new illuminants of interest were brought out during the year in France. Professor Urbain of the University of Paris has invented a quartz tube arc between a negative terminal of mercury and an anode of tungsten. The latter becomes intensely heated by the bombardment of the arc stream and the two in combination yield a brilliant white light of high efficiency. The production of ultra-violet radiation by this form of arc is said to be exceptionally great, and it is expected to be of great utility for purposes of sterilization. A new form of vacuum tube somewhat resembling the Moore type, is undergoing experimental development. The gas employed is neon, which is enclosed in glass tubes about seven feet long and plied to such a tube produce brilliant luminescence with an efficiency equivalent to 1.25 candles per watt. A difficulty to be overcome is the relatively short life of the tubes, but the prospect for this lamp is considered very promising, as it is distinctly superior to the Moore tube in brilliancy and efficiency.

The year 1911, like 1910, was distinguished by the immense amount of research expended upon scientific problems closely associated with electric lighting. Notable among these were the radiant efficiency of incandescent lamps, high temperature measurements, proposed primary light standards, and the dependency of visual acuity on the color of light.

ELECTRIC PROPULSION OF SHIPS. See NAVAL PROGRESS.

ELECTRIC RAILWAYS. While the developments in electric traction in 1911 were in no sense revolutionary, they were of such a character as greatly to strengthen the confidence of engineers in the ability of electric motive power to meet the severest conditions. The successful operation of the electrified Hoosac Tunnel, and the extraordinary record for reliability attained by the electrical equipment of the Pennsylvania Tunnel at New York, were important contributors to this end. The Hoosac Tunnel is the longest in the United States, and represents a particularly difficult situation for electric power on account of the close clearances and presence of moisture. The 11,000-volt overhead trolley by which single-phase current is supplied to the locomotives operated without a single failure, while the record of the motors is scarcely less gratifying. A second important development in the New Haven system, was the yard construction for the 11,000-volt single-

phase electrification of the Harlem division. The close of the year brought the announcement of the decision to proceed at once to the electrification of the main line from Stamford to New Haven, which will add forty-one miles to the present electrified zone of thirty-four miles. The great success of this venture points to the ultimate extension of single-phase electrification to Boston, and its possible adoption throughout the entire New England system.

During the first year of operation of the Pennsylvania tunnel and terminal, 176,180 electrically operated trains were run with but thirteen delays, totaling ninety-eight minutes attributable to the locomotives or motors. The operating success of the New York Central terminal has been equally conspicuous when the difficulties attendant upon the work of reconstruction are considered. The New York Central extended its electric zone from Hastings to Tarrytown during the year. In addition to the above, the electrification on the 1200-volt direct-current system of the Oakland, Berkeley, and Alameda lines of the Southern Pacific system in California is of significance in the realm of main line traction.

The growth of interurban and suburban systems fell behind the record of preceding years in 1911. It is suggested that the fare reductions enforced on the steam lines by legislative action account for this retardation. In this field the extension of the 1200-volt direct-current system has been most noteworthy, several hundred miles having been equipped during the year. The tendency toward still higher trolley voltages for direct currents is indicated by the installation of a 1500-volt system. These advances are made possible by the constant improvement of the commutating conditions of interpole rotary converters. In all 1191.9 miles were added to the electrically operated trackage of the United States and Canada in 1911.

Subway transit received a great impetus during the year. Important extensions were made in Brooklyn, New York, and Boston, while the situation in New York makes a much greater extension imperative. In Chicago an engineering commission was appointed to consider the situation and submit feasible plans, with excellent prospects for early construction.

In the city surface systems the most important items to be noted are the growth in popularity of prepayment cars, the extensive use of the interpole motor, a great increase in the use of trailers and in the application of multiple-unit control, the increase in the use of heavy steel cars and, on the other hand, of very light cars for storage battery propulsion.

In the advance of heavy traction in Europe the single-phase system continues to predominate. In Sweden an interesting installation is the 80-mile line from Kiruna to Riksgården, entirely within the Arctic circle. The power is brought from a water plant at Porjus, a distance of 120 miles over a single-phase line of 50,000 volts, and is stepped down to 15,000 volts for the trolley wire. Single-phase power is also being installed on the Loetschberg line in Switzerland. A 2000-horsepower locomotive has been developed for this line which is capable of hauling a 310-ton train up a 2.7 per cent. grade at a speed of twenty-seven miles per hour. Experiments of great importance are being carried on in France and Germany with a view to combining the now well recognized merits of single-

phase alternating current for transmission with the superior motive power afforded by direct currents. An experimental French locomotive was given a trial on the Midi system with a mechanical rectifying outfit consisting of a commutator driven by a synchronous motor for supplying direct current to the motors. The control of voltage and speed is obtained by shifting the brushes on the commutator. The power factor obtained was excellent, above .50 when starting, and from .95 to .98 when running. The efficiency from line to rails is reported to be 78 per cent. In Germany Hartmann and Braun have developed a high-power mercury arc rectifier capable of converting currents as great as 300 amperes at voltages well adapted to direct-current motor operation. The departure from ordinary practice consists in forming the mercury arc in a steel tube which is artificially cooled. The tube is made in two parts insulated from each other by a gasket, and is said to have a practically indefinite life under conditions as severe as those of railway service. One of the American manufacturing companies is engaged in the development of a similar device with a view to its use for car and locomotive operation.

ELECTORAL REFORM. Under this head is discussed the progress in 1911 of those movements designed for the purpose of bringing the people into more active participation in elections and legislation, and for improving the conduct of elections. These movements include the initiative and referendum, recall, short ballot, direct primaries, direct election of United States senators, legislation against corrupt practices in elections, and presidential primaries.

INITIATIVE AND REFERENDUM. The initiative gives the people the power to originate laws. If a certain percentage of the voters sign a petition for a law and file it with the proper official, it must come before the legislature. The referendum is the referring of legislation to the people for final rejection or acceptance. The referendum and initiative provide for direct legislation, that is, legislation directly by the people. They are employed in municipalities as well as in States.

At the end of 1911 they were in force in 209 cities in twenty-five States, and were a part of the fundamental law for State purposes in eleven States: Maine, Missouri, South Dakota, Arkansas, Oklahoma, California, Colorado, Arizona, Montana, Nevada, and Oregon. State legislatures in 1911 provided for submission in 1912 of the initiative and referendum to the people in eight other States, Washington, Idaho, Wyoming, North Dakota, Nebraska, Florida, Wisconsin, and Indiana. The legislature in Ohio granted the initiative and referendum to all cities. In Kansas, Massachusetts, and Illinois, the initiative and referendum passed both houses of the legislature, but lacked a constitutional majority in one house. In Minnesota and Michigan it passed one house of the legislature by the required majority, but lacked a few votes in the other house.

RECALL. The recall is a provision for the retirement of an elected officer before the expiration of his term of office, by the signing of a petition of a proportionate number of the electors who voted for him, demanding another election. It is usually found in conjunction with the initiative and referendum, and is most com-

monly employed in municipalities. The recall as applied to the judiciary is a feature of the movement which was brought prominently before the people in 1911 as the result of the incorporation of a provision for the recall of judges contained in the constitution of Arizona. A full discussion of this will be found under **ARIZONA**. The question of the recall of judges was submitted to the voters of California in an election in 1911, and was carried by a substantial majority (see **CALIFORNIA**). During the year the right to recall was granted to citizens in Idaho, Montana, North and South Dakota, Washington, Wisconsin, Wyoming, and California. See also **WASHINGTON**, for use of the recall in Seattle and Tacoma.

DIRECT PRIMARIES. Several important measures were passed in State legislatures in 1911, providing for more direct participation by the people in elections in both State and national elections. In New York, after an effort which began with Governor Hughes in 1909, a direct primary law known as the Levy law was passed. This was a compromise measure and did not meet with general approval by either the advocates or opponents of direct primaries (see **NEW YORK**). In New Jersey the direct primary law was modified by the Geran law. For a discussion of this see **NEW JERSEY**. Important amendments to the direct primary laws were made in Maine, Massachusetts, and Wyoming. In South Dakota the measure will be referred to the people in 1912. For a discussion of the Maine law see **MAINE**. Revisions of more or less importance were made to the direct primary laws of Wisconsin, Missouri, Kansas, Nebraska, Nevada, and California.

DIRECT ELECTION OF SENATORS. A joint resolution providing for the direct election of senators was introduced in the second session of the Sixty-first Congress. This passed the House, but on February 28, 1911, it was defeated in the Senate by a margin of four votes. On the roll call 54 senators voted in favor of the resolution and 33 against it. A joint resolution requires a two-thirds vote. The resolution was defeated by the votes of Southern senators, who, while they favored the proposal for the direct election of senators, declined to vote on the so-called Sutherland amendment, which provided that the control of senatorial elections should remain in the hands of the federal government. The resolution in its original form provided that the control of elections should be taken from the federal government, where it is now secured by Section 4 of Article I. of the Constitution, and placed in the hands of the State legislature. The Southern senators who voted against the resolution with the amendment, expressed the fear of negro domination if there should be federal control of the elections. The joint resolution was reintroduced in the first session of the Sixty-second Congress, and on April 14 it passed the House of Representatives by a majority of 296 to 16. Several amendments, including one similar to the Sutherland amendment in the Senate, were defeated. On June 12 the Senate by a vote of 64 to 24 passed the resolution with an amendment submitted by Senator Bristow, which was practically the same as the Sutherland amendment. This provided that the control of elections shall remain in the hands of the federal government. The resolution passed only after the vote of Vice-President Sherman had broken a tie of 44

to 44. As the House of Representatives had passed the resolution without amendment it was necessary for the bill to go into conference and it did not emerge before Congress had adjourned, so that the resolution did not become a law.

During the year seven States, California, Kansas, Minnesota, Montana, New Jersey, Ohio, and Wisconsin enacted through their legislatures measures providing for the Oregon plan of pledging candidates for the legislature to vote for the people's choice for United States senators, as indicated in the general primary election held previously. In Ohio the Oregon plan was adopted by the legislature, but vetoed by the governor. In South Dakota it was defeated in the legislature, but was submitted to the people by initiative petition, and is to be voted on at the general election in 1912.

CORRUPT PRACTICES. At the extra session of the Sixty-second Congress, an act was passed to provide for the publicity of contributions for the purpose of influencing elections at which representatives in Congress are elected. This act prohibits any candidate for representative from giving, contributing, expending, using, or promising any sums in the aggregate exceeding \$5000, in any campaign for his nomination and election. A Senator is limited to \$10,000. Sworn statements of all expenditures must be filed with the clerk of the House of Representatives at Washington by candidates for Congress, and with the clerk of the Senate by candidates for the Senate, not less than ten nor more than fifteen days before the time for holding any primary election or nominating convention, and not less than ten nor more than fifteen days before the day of the general or special election at which the person is to be elected.

The legislatures of 1910-11 in the various States amended the corrupt practices acts and adopted them to provide for publicity of campaign expenses. This was done in Idaho, Indiana, Maryland, New Hampshire, Ohio, South Dakota, Wisconsin, New Jersey, Wyoming, and California. In November, 1912, an election was held in Colorado upon the corrupt practices law initiated by the people. In New York, North Dakota, and Maine stringent acts or amendments were added to the present law.

SHORT BALLOT. The short ballot is an attempt to simplify elections by placing only a few officers in nomination at one time and providing that only important officers be elective. Two short ballot amendments were submitted at the special election held in California on October 10, 1911; and both were adopted by the people. The movement is in a theoretical rather than a practical stage at the present time.

PRESIDENTIAL PRIMARIES. The presidential primary is a device to enable the voters at large to record their choice for candidate for the presidency. It was little heard of previous to 1911, but in that year it was widely discussed. Provisions for the presidential primary exist as a statute in six States, New Jersey, Wisconsin, Nebraska, North Dakota, Oregon, and California. The general nature of these statutes may be indicated by citing the provisions of the California measure. This provides that the name of any person may be put upon the ballot at the presidential primary election to be held in May, 1912, through the filing of a petition signed by 1 per cent. of the voters of any party in each Congressional district. It is provided that any

such person may, within thirty-five days of the filing of the petition, file a declaration that he is not a candidate and does not wish his name placed on the ballot, in which case his name shall not appear thereon.

In addition to the States which have provided for the presidential primary by formal statutes, South Carolina and Louisiana have it as a party rule. Other States have what amount to its equivalent. In Pennsylvania delegates to the national convention are elected by direct primaries and candidates for delegates are permitted to print on the ballot the name of the candidate for the presidency whom they wish to support.

The presidential primary had its chief support among the members of the progressive wings in both Democratic and Republican parties in 1911. An attempt was made to indorse the device at the meeting of the Republican national committee, held in December in Washington. But this was not successful. See **UNITED STATES, section Election of 1912.** The chief objections urged by the opponents of the presidential primary are that it would intensify factional bitterness, would add to the expense of national elections, and that especially in 1912 it would confine the choice of all Republicans to the candidacy of Mr. Taft and Mr. La Follette, who were the only avowed candidates. This is on the assumption that only the names of avowed candidates could be placed on the ballot.

The chief merit of such a primary in the opinion of those who support it, would be the practical elimination of the national nominating conventions and the opportunity given the people at large of recording their choice for the presidency.

Indications were that in 1912 the movement would extend to a number of other States. The Democratic State platform in Arizona committed that party to the reform, and the Republican State committees of Massachusetts and Ohio openly supported it. There was a strong sentiment in its favor in the Democratic party in Massachusetts, and progressives of both parties in Kansas and Missouri were warm advocates of the measure. Although, as noted above, the Republican national committee by a majority of the votes refused to advise employment of the presidential primary, the call for delegates permitted, at the discretion of State committees, primary elections in those States where there is a primary law, though such action was not mandatory.

ELECTRON THEORY. See **PHYSICS.**

ELEMENTS, NEW. See **CHEMISTRY.**

ELIOT, AUGUSTUS G. An American physician, died in May, 1911. He was born in Woodstock, N. Y., in 1821. He was educated at New York University and at Yale, where he graduated in 1839. Four years after he received his degree as a physician from the College of Physicians and Surgeons, New York. He later became visiting physician to New York Hospital and to Bellevue Hospital. He was one of the oldest graduates of Yale University and was one of the founders of the New York Academy of Music. For many years previous to his death he lived abroad.

ELIOT, CHARLES W. See **LITERATURE, ENGLISH AND AMERICAN, Political and Social Science.**

ELIZABETH (N. J.) PUBLIC LIBRARY. See **LIBRARY PROGRESS.**

ELKINS, STEPHEN BENTON. United States senator from West Virginia, died January 4, 1911. He was born in Perry county, Ohio, in 1841, and received his early education in the public schools of Missouri. He graduated from the University of Missouri in 1860. In 1864 he was admitted to the bar and in the same year went to New Mexico, where he acquired a knowledge of the Spanish language and began the practice of law. In 1864-5 he was a member of the Territorial legislature of New Mexico and was later Territorial district attorney. In 1868-9 he was attorney-general and from 1870 to 1872 was United States district attorney. He served as delegate in the Forty-third and Forty-fourth Congresses in 1873-7. During his first term in Congress he was made a member of the Republican national committee, on which he served for three presidential campaigns. After leaving Congress he removed to West Virginia and devoted himself to business affairs. He became largely interested in coal-mining and railroads and founded the town of Elkins. In 1891 he became one of the most prominent figures in the politics of West Virginia and was also conspicuous in national affairs. In 1891 he was appointed secretary of war by President Harrison and served throughout the latter's administration. In 1894 he was elected to the United States Senate to succeed Johnson M. Camden and was reelected in 1901 by the unanimous vote of the Republican members of the legislature. He was again unanimously reelected in 1907. His term of service would have expired in 1913. Senator Elkins was perhaps the most popular member of the Senate, both with his party associates and with Democratic senators as well. He was of the more conservative type and was identified with the reactionary element in the Senate. He was a member of many important committees and had charge of the amendments to the Interstate Commerce act, which resulted in the railroad bill passed in 1910. He also had charge of the Railway act, which was known as the Elkins act, passed by Congress in 1903.

ELMAN, MISCHA. See **MUSIC.**

ELY, SMITH. An American public official, formerly mayor of New York city, died July 1, 1911. He was born at Hanover, N. J., in 1825, and graduated in law at New York University in 1862. He did not, however, practice law, but entered the leather business, in which he was engaged until 1878, when he retired. He took an active interest in politics and was a member of the New York State Senate in 1857. He was elected to the Forty-second and Forty-fourth Congresses, resigning from the latter in 1876. In the following year he was elected mayor of New York city. This was during the prosecution of the famous "Tweed Ring." Mr. Ely had been a strong opponent of Tweed and his associates. His administration was a vigorous one and did much to better conditions in the city following the Tweed rule. Mr. Ely amassed a large fortune, a considerable portion of which was bequeathed to charitable and educational institutions. See **GIFTS AND BEQUESTS.**

EMBRYOLOGY. See **ZOOLOGY.**

EMMONS, SAMUEL FRANKLIN. An American geologist, died March 28, 1911. He was born in Boston in 1841 and graduated from Harvard in 1861. He studied at Paris and in Berlin.

He was geologist of the United States Geological Survey in the exploration of the fortieth parallel from 1867 to 1877. Two years thereafter he conducted a cattle ranch in Wyoming and then again became connected with the United States Geological Survey, in which position he remained until the time of his death. He was a member of many learned societies both in the United States and in foreign countries. He was for three terms vice-president of the American Institute of Mining Engineers. He was the author of *Descriptive Geology of the Fortieth Parallel* (written with Arnold Hague, 1877); *Geological Guide Book to the Rocky Mountains*; *Geology of Lower California* (1890); *Geological Distribution of the Useful Metals in the United States* (1893); *Progress of the Precious Metal Industry in the United States* (1893); *Geology of Government Exploration* (1896); *Theories of Ore Deposition, Historically Considered*; and *Biography of Clarence King*. He also contributed papers on geology to technical journals and wrote many official reports.

EMPEROR WILLIAM SCIENTIFIC RESEARCH FOUNDATION. See **CHEMISTRY, INDUSTRIAL.**

EMPLOYERS' LIABILITY. PROGRESS IN 1911. This subject, which has received an unusual amount of attention during the past few years, was given even greater attention during 1911. A number of the investigations begun by State commissions in preceding years were either completed or continued and new investigations were begun in Michigan, Maryland, Missouri, Rhode Island, and Texas, and by the United States government. A committee of the National Association of Manufacturers, appointed late in 1910, continued its extensive investigations into European systems of compensation for industrial accidents. The National Civic Federation formulated and submitted for societies and legislatures a model law. Everywhere the old common law doctrines are being undermined and replaced by the more intelligent and humane plan of compensation on a definite basis. The following States enacted legislation embodying the newer ideas: California, Kansas, Massachusetts, Minnesota, New Hampshire, New Jersey, Ohio, and Washington.

NUMBER AND CAUSES OF ACCIDENTS. Considerable attention is given to the number and causes of industrial accidents, as an important phase of the conservation of the human resources of the country. The various estimates of the number of persons killed or injured annually in the United States range from 500,000 to 2,000,000. The number actually killed is placed at 35,000 to 50,000 per year.

The causes are numerous. Among them are the ignorance, carelessness, and unsuitable clothing of the worker; insufficient lighting; dirty and obstructed work places; defects of machinery and structures; absence of safeguards; fires; steam generators; electricity; railways; and elevators. Some hold that more relief will be secured through adequate supervision by mechanical engineers and the education of the workers, than through legislation. Some hold that much blame attaches to supervisors and the guardians of general facilities, who are both culpably and excusably ignorant. Mr. John Calder of the American Society of Mechanical Engineers believes the chief cause to be carelessness combined with ignorance, and some-

times thoughtlessness or horseplay on the part of the workers. He found also that the number of accidents increases as the days grow shorter in the fall and daylight lessens. When insufficiency of artificial light is combined with crowding of machines and accumulation of waste many injuries are inevitable. He advocated not only the general increase of safeguards as an integral part of the machines when constructed, but also great care in the manufacture of the machines to eliminate all projecting screws, hooks, bolts, or nuts, and to reduce the possibility of injury from belts, pulleys, shafts, spindles, and other moving parts. He believed rules far less important than their enforcement by a capable and high-minded foreman.

The statistics of German experience showed that 18.2 per cent. of accidents are attributable to the employer; 28.4 per cent. to the employee; 9.4 per cent. to employer and employee combined; and 44 per cent. to the natural risks of industry. They show that accidents per one thousand employed are 22.9 in teaming; 15.7 in quarrying; 14.6 in mining; 11.4 in building trades; 9.2 in chemical manufacturing; 6.3 in electrical manufacturing; 4.9 in the glass industry; 2.8 in printing; that the average in all industries is 9.5; but in farming 11.1.

Similarly, American statistics show that not more than 20 per cent. of accidents are due solely to the negligence of the employer and not over 35 per cent. to the negligence of the employee; so that about one-half of the cases are due to natural risks, combined with the negligence of both parties. This, of course, does not mean that the introduction of greater safeguards will not reduce the natural risks of industry.

ESTIMATED LOSS. The Employers' Liability Commission of Ohio estimated the fatal and non-fatal industrial accidents in this country at not less than 536,000 per year, and stated that in all probability the number exceeded one million. If the loss due to the non-fatal injuries of 2000 workmen be estimated at \$5,228,000, as was done by Crystal Eastman in her *Work Accidents and the Law* (page 317), then the total loss from all accidents cannot be less than several hundred million dollars, if not a billion dollars as the minimum. Professor Seager estimated the loss due to fatal and non-fatal accidents at not less than \$250,000,000 per year. Of this he considered one-half to be preventable.

COMPENSATION RECEIVED UNDER EMPLOYERS' LIABILITY. The Ohio commission found that no compensation was received in 59 per cent. of the cases of fatal accident in Cuyahoga county, and in the other 41 per cent. of the cases, the net compensation, after payment of lawyers and undertakers, was only \$600 on an average. Taking the State as a whole they found that in 59 per cent. of the cases of fatal accidents to married men no compensation was secured, and that in 73 per cent. of the fatal cases of unmarried men, or 64 per cent. of all fatal cases, no compensation was received; and that the average compensation in the other fatal cases was only \$838.61.

The Employers' Liability Commission of Illinois, after investigating more than five thousand cases, found that fifteen out of every one hundred cases of accidents, fatal and non-fatal, are taken to court; of these eight are won; leaving 92 per cent. of all cases in which no

compensation is received. In fifty-three fatal cases the commission found the average compensation to be \$1877, of which \$791 went for litigation fees.

Mr. John Mitchell, speaking before the American Academy of Political and Social Science, stated that in the eleven years 1894 to 1905 the employers' liability insurance companies of the United States received almost exactly \$100,000,000 in premiums. Of this enormous sum 43 per cent. was paid out in the settlement of claims of injured workmen. Of the amount thus paid out from one-third to two-fifths at the very least went for the payment of attorneys' fees and other court expenses. Therefore, not more than 30 per cent. of the sum paid by employers actually aided injured employees, so that \$55,000,000 were really wasted.

LIABILITY VS. COMPENSATION. The most striking tendency with reference to legal responsibility for industrial accidents in recent years has been the gradual abrogation of the common law doctrines of "assumed risk," "contributory negligence," and the "fellow-servant rule," behind which employers have freed themselves from liability, and the increasing demand for the principle of compensation to the injured workman on the basis of some definite scale.

There are in general two classes of workmen's compensation laws: One imposes the liability upon the individual employer, while the other is based on the principle of mutual insurance. Laws of the first class may be either optional or compulsory. When optional they are applicable to certain dangerous trades and contain a clause allowing the employer or the employee, as the case may be, either to accept the law or to reject it in favor of the old principle of liability. The compulsory laws are usually applicable to all trades and enforce the substitution of workmen's compensation for employers' liability without any optional choice. The laws passed in Kansas, New Hampshire, New Jersey, and California (except where the State or a city is the employer) are optional, and the cost falls on the individual employer. In Ohio and Washington a system of State insurance is provided, this being elective in Ohio, but compulsory in Washington. Massachusetts and Minnesota also adopted the insurance idea. In New Jersey the acceptance of the compensatory schedule by the employer is presumed in the absence of written statement to the contrary; in the other States the employer is required formally to accept the schedule. If the employer accepts the compensatory scheme the worker must accept it in some cases and in others is presumed to do so in the absence of written notice to the contrary. In New Jersey, Kansas, and Ohio the common law defenses of employers' liability are removed, if the employer does not accept the compensation plan; but in Kansas and New Jersey these defenses may be employed if the contributory negligence of the worker is willful. In the other States these defenses are specially restricted. In California, New Jersey, and Ohio the new laws apply to all industries; in the other States only to an enumerated list of dangerous occupations. In some States a dispute as to a claim for compensation under the act must be submitted to an administrative board or public officer with appeal to the courts; in others the dispute is taken to the court directly. The most serious objection to those laws which impose responsibility upon the individual em-

ployer is that in case of serious accident resulting in the death or injury of a number of employees the employer might be forced into bankruptcy, and the injured workmen receive almost no compensation. This objection is only partially met when the employer insures his risk with an insurance company. The great advantage of the mutual insurance plan is that the risk is widely distributed, is borne by the whole community, and there is no possibility that the injured workers will not receive the compensation provided by law.

MASSACHUSETTS PLAN. The industrial legislation of Massachusetts is watched with considerable interest because of its advanced character. In some respects Massachusetts is the oldest industrial community in this country, and its legislation often indicates the line of progress for other States. The law of 1911 providing for workmen's compensation is no exception. This law is divided into four parts. Part I extends employers' liability by removing the common law defenses of those employers who do not accept the compensation plan. If the employer does accept the plan these defenses are completely restored; indeed, the employer is allowed to shift all responsibility to the insurance association or company authorized by the law, unless serious and willful misconduct on the part of himself or one of his authorized agents can be shown. If the employer accepts the compensation scheme his employees are presumed also to accept it unless they give notice at the time of contract. Part II sets forth the scale of compensation. In case of death dependents wholly dependent receive one-half of the average wages for 300 weeks, but not less than four dollars nor more than ten dollars a week. Partial dependents receive only a part of such compensation. If there are no dependents, sickness and funeral expenses up to \$200 are provided. In case of total disability the injured receives one-half his wages, but not less than four dollars nor more than ten dollars a week for not more than 500 weeks, the total amount not to exceed \$3000. In case of partial disability the injured receives one-half the loss of wages, but not more than ten dollars a week, nor for more than 300 weeks. Special compensation is also provided for specified injuries, such as the loss of an arm. No compensation is payable in case of serious and willful misconduct of the employee himself; but in case of such misconduct on the part of employer or superintendent the compensation is doubled. Part III provides an industrial board of three members appointed by the governor, to have charge of the administration of the act. Provision is also made for local boards of arbitration to settle disputes; and also for appeal to the courts. Part IV provides for the formation of the Massachusetts Employees' Insurance Association, a mutual organization subject to the State insurance commissioner and responsible for paying compensations. This association becomes effective January 1, 1912. It will have a board of fifteen directors. As an alternative to becoming a subscriber to this association an employer may become a policyholder in a liability insurance company authorized to do business in the State. The main object of this part of the law is to replace individual responsibility for the payment of compensation by some form of mutual responsibility. The first three sections of the act become effective July 1, 1912. The act

was submitted to the Supreme Court of the State before enactment and declared to be constitutional.

OHIO PLAN. The Ohio commission, whose investigation and report is one of the most extensive and elaborate ever made, presented a plan of workmen's compensation for both fatal and non-fatal accidents in all industries. This plan was the next logical step following the Ohio legislation of 1910, which practically eliminated the common law doctrines from its employers' liability law. This plan provides for medical fees up to \$200 in many cases, and \$150 for funeral expenses in fatal cases. The compensations for death range from \$1500 to \$3400, depending on the wage. In case of total disability the compensation would equal two-thirds of wages for not more than 300 weeks; the aggregate not to exceed \$3400, nor to be less than \$1500. Permanent disablement would be compensated by a life pension equal to 60 per cent. of wages plus not more than \$150 for medical aid. In case of partial disablement the compensation would equal 60 per cent. of the impairment of wages so long as this impairment lasts; but the weekly compensation must be between \$5.00 and \$12.00 and the aggregate between \$1500 and \$3400. If the employer accepts this plan then his workers have no alternative but to accept it also. If the former, however, does not accept it he loses the protection of the common law doctrines. The fund from which compensation is to be paid is formed by contributions of both employer and workers, the former paying 90 per cent. and the latter 10 per cent., on a mutual insurance basis.

NEW YORK LAW. The constitutionality of the compulsory workman's compensation act passed by the New York legislature in 1910 was tested by a case brought by the South Buffalo Railway Company in October of that year. This law applied to about ten dangerous occupations, including railway operations. The company contended that the law denied the employer the equal protection of the laws, violated the right of trial by jury and also limited the amount which the family of a fatally injured workman might receive. The lower court held that the legislature has the power to shift responsibility for injuries arising out of the necessary risks of a business from the employee to the employer. When the case was taken to the Court of Appeals, the highest court of the State, a unanimous decision declared the law unconstitutional. The court called the law "revolutionary." It did not annul the law because it overthrew the common law doctrines, but because "in our view of the constitution of our State, the liability sought to be imposed upon the employers enumerated in the statute is the taking of property without due process of law, and the statute is, therefore, void." By "due process of law" the court meant "regular course of administration through courts of justice, citing in this connection that provision of the State constitution which reads 'trial by jury in all cases in which it has been heretofore used shall remain inviolate forever.'" It, therefore, held that to impose upon employers liability for accidents without court trial was "plainly a deprivation of liberty and property under the federal and State constitutions, unless its imposition can be justified under the police power." It then expressed its opinion that this act did not come within the police power.

This New York decision was very vigorously objected to by a considerable number of legal writers throughout the country. It was cited as another conspicuous failure of the courts to approve the social tendencies of the day. It was pointed out that the legal system should not be rendered inflexible by judicial decisions, but should within reasonable conditions be adapted to social and economic life. Moreover, it was pointed out that the decision was not in harmony with the decision of the Supreme Court of the United States upholding the laws extending the liabilities of property. The law making the shipowner liable for the care, keep, and cure, in case of accident, of a seaman was declared not to take the shipowner's property without due process of law. Similarly the bank deposit guarantee laws of Oklahoma, Kansas, and Nebraska were upheld by that court on the ground that the legislature in order to secure some public advantage may impose added responsibilities upon private property. It also stated that "in a general way the police power extends to all the great public needs. It may be put forth in aid, without sanction by usage, when held by prevailing morality or strong and preponderant opinion to be greatly and immediately necessary to the public welfare." This New York decision was expressly disapproved by the Supreme Court of the State of Washington in its decision maintaining the insurance compensation law of that State, and similarly disapproved by the Supreme Court of Kansas. The National Civic Federation began a movement for the amendment of the State constitution permitting the enactment of a compensation law. This was supported by some union labor leaders, who nevertheless favored the immediate development of the insurance idea.

THE NEW JERSEY PLAN. The New Jersey commission appointed in 1909 reported a bill to the State legislature in January. This was almost unanimously passed in April. It applies to all industries. The first section of this law entirely abrogated the "fellow-servant" and "assumption of risk" rules and provided that the doctrine of "contributory negligence" should apply only when the employer could prove that the negligence of the employee was "willful." The law defined "willful" as "(1) deliberate act or deliberate failure to act; or (2) such conduct as evidences reckless indifference to safety; or (3) intoxication." The second section provided an elective system of workmen's compensation. The law is presumed to apply to all contracts of hiring unless either party notifies the other in writing of his intention to continue under his common and statute law rights as expressed in the first section. The compensation provided for temporary disability is 50 per cent. of wages; for total and permanent disability, 50 per cent. of wages for 400 weeks; for partial and permanent disability a variety of compensations are provided for the most common forms of injury; thus, compensation of half wages for five weeks is provided for the loss of one joint of a toe and half wages for 200 weeks for the loss of an arm. In case of death the compensation is based on the number and relationship of actual dependents, the maximum being \$10 per week for 300 weeks. The law is applied to all employments, including domestic services. It was expected that the optional character of the law would forestall any attempt to find it unconstitutional on

grounds similar to those taken by the Court of Appeals in New York. The law also provided for a permanent commission to which every accident must be reported, giving name and nationality of injured and compensation given.

OTHER PLANS. The plan adopted in Washington is based on the idea of mutual insurance, the State being the custodian of the fund. To this fund the employer pays a certain per cent. of his yearly payroll according to the relative hazard of the industry. The scale of compensation for death or total disablement ranges from \$1500 to \$4000. For non-fatal accidents the compensation is equal to about 60 per cent. of the impairment of wages. The act applies to a large number of dangerous employments enumerated therein. The employee is required to waive his rights to sue for damages. The employer is required to contribute four cents for each day that the injured employee has worked to a first aid fund, which cares for the injured during the first three weeks after the accident. The Minnesota plan is similarly based on the idea of insurance. The scale of compensation ranges from \$1500 to \$3000 in case of death. For non-fatal injuries the compensation is about 50 per cent. of the impairment of wages. The Wisconsin act is similar to that enacted in 1910 in New York State. It is optional with the employee whether he should accept the compensation provided in law or sue his employer in the courts. The scale of compensation follows that of the New York law already mentioned, which provided that in case of death the compensation should be 1200 times the average daily wage, but should not exceed \$3000; and for non-fatal injury the compensation should be one-half the average weekly wages, but should not exceed \$10 per week. The California law allows a maximum for medical services of \$100. In case of fatal accident the dependents receive each week for three years an amount equal to the average weekly earnings of decedent, but not less than \$1000 nor more than \$5000. For total disability the compensation ranges from 65 per cent. to 100 per cent. of the average weekly earnings during disability; and for partial disability, 65 per cent. during such period. The Kansas law provides a compensation equal to three times the yearly earnings in case of death, provided this be between \$1200 and \$3600. For permanent disablement it provides weekly payments of 50 per cent. of wages for ten years and for partial disablement weekly payments of from 25 per cent. to 50 per cent. of wages for not more than ten years. The compensations provided in New Hampshire are 150 times the weekly wages, but not to exceed \$3000, in case of death; 50 per cent. of wages, but not over \$10 per week nor for more than 300 weeks, in case of total disablement; and 50 per cent. of loss of wages, with similar restrictions as to amount and time, in case of partial disablement.

MODEL LAWS. The model law of the National Civic Federation committee provided compensation only for workmen earning less than \$1800 a year. The compensation provided ranged from small amounts for trivial injuries to four years' wages, but not to exceed \$3000 in case of death. Settlements may be by private agreement or by arbitration. The payment may be either in lump sum or in periodical form. The law applies to many industries, giving compensation for practically all accidents. The injured workman is allowed to sue for damages where the

employer is at fault. A similar model law was prepared by a committee of the Conference Commissioners on Uniform State Laws. These two bodies planned to push their measure in numerous legislatures in 1912.

The American Mining Congress accepted the report of a committee which proposed a law imposing upon coal-mining companies the inherent and unavoidable risks of the industry. This model law provided for an annual levy of one per cent. per ton on all coal mined; this was to be paid to the State treasurer and held by him in "The Employers' Accident Indemnity Fund." From this fund the State would make payments for both fatal and non-fatal accidents in coal mines, the amount to be paid being specified in the law.

FEDERAL COMMISSION. The Federal Commission on Employers' Liability and Workmen's Compensation made public a tentative plan for legislation on October 25. This provided for compensation to be paid by interstate carriers to their employees injured during employment, except in cases of willful misconduct. The plan provided for these payments to be made by the employer through government agency rather than on a mutual insurance basis. The law was to be compulsory; and to apply to all accidents occurring during employment. The payments provided were to be periodical during a limited term of years and within minimum and maximum limits. In other respects the plan embodied the usual features of the compensation laws. Hearings on this plan were held November 6 to 10, the plan proving generally acceptable to both labor and capital. Some manufacturers, however, expressed a desire that the plan be broadened so as to include them.

A tentative bill was drafted late in December by the commission. It provided for a pension in fatal cases to be paid monthly for eight years, and to vary from 15 per cent. to 50 per cent. of wages, according to the number of dependents; for permanent total disability, a pension equal to one-half wages payable monthly during life. For permanent partial disability one-half the monthly wages were to be paid during periods set forth in the following schedule: For loss of arm, 72 months; for loss of hand, 57 months; for loss of leg, 66 months; for loss of foot, 48 months; for complete loss of hearing, 72 months; for loss of hearing in one ear, 36 months; for loss of sight of one eye, 30 months; and in other cases in similar proportion. The estimated cost to the government was \$400,000, and to railways \$15,000,000. The most frequent criticism of this bill was that the list of definite compensations was so small that the adjusters would be forced to fix compensation for a wide range of injuries, thus introducing discriminations.

PRIVATE COMPANY PLANS. Workmen's compensation schemes have voluntarily been introduced by the United States Steel Corporation and the International Harvester Company. The latter's plan is non-contributory, except that the men are required to provide a fund to pay compensation for injuries lasting less than thirty days. This is designed to increase their interest in avoiding accident. The Harvester Company's plan extends to all employees in twine, steel, and lumber mills and on railways and to their widows and children. For fatal accidents the compensation ranges from \$1500

to \$4000, being three years' wages. Special compensation is provided for loss of hand, foot, or eye. In other cases the compensation equals one-fourth of wages during the first thirty days and one-half wages beyond this and up to 104 weeks. If disablement continues longer than two years, a pension is provided. The plan of the Steel Corporation is similar. The Standard Oil Company has no general plan, but has generally avoided litigation by making satisfactory settlements.

Smaller companies and organized labor have both opposed these private compensation plans. The National Association of Manufacturers' pronounced them lavish and condemned them because non-contributory. It pointed out that a small company might be ruined by an unusual accident, if a generous scale of compensation were carried out, and that competition prevented such companies from instituting compensation schemes. While the association recognized the evils of the present system, it condemned compulsory compensation legislation as hasty and unwise; it favored contributions by both employers and workers, on an actuarial basis, to a mutual insurance company providing automatic indemnity to injured workmen.

Organized labor, on the other hand, at a meeting of representatives in New York City, expressed strong disapproval of the trusts' schemes of compensation on the ground that their object was solely to increase profits and business ability by chaining labor to the company. This would destroy the independence and mobility of labor and reduce it to a status likened in many respects to that of serfs under feudalism. The labor representatives therefore favored compulsory compensation on an insurance, but non-contributory, basis.

PROGRESS IN OTHER COUNTRIES. About thirty countries and self-governing colonies have already done away with the old form of employers' liability and introduced compensation according to fixed scales irrespective of the negligence of the worker. In foreign countries some form of insurance under the compensation principle is practically universal. Such insurance is of two kinds, compulsory and voluntary. The compulsory insurance may be in either prescribed institutions or in institutions optionally chosen. As illustrations of the former, in Norway there is one state insurance bureau for all industries, as there is also in Luxemburg; in Hungary there are two institutions, and in Austria seven employers' mutual insurance associations controlled by the state, these being grouped according to territory. In Germany there are sixty-six employers' associations, each covering the entire country for one group of industries, besides forty-eight agricultural associations, with state regulation. Compulsory insurance with choice of insurance institutions is found in Italy, and in the Netherlands where the state also competes with the private or mutual associations, and in Finland, where the state does not compete with them. Voluntary insurance with state competition is found in Sweden and France; and without state competition, in Belgium, Denmark, Great Britain, the British colonies, Russia (except for miners employed by the state), and Spain. In all of these countries the payment of the prescribed compensation is fully guaranteed. It is easily accomplished where there is compulsory insurance in pre-

scribed institutions controlled by the state. In other cases the state requires the insurance institution to give satisfactory guarantees to the government or the state bank; in still others the state itself provides a guarantee fund. Or, the state may require the insurance companies to maintain proper reserves; or it may give employees preferred claim upon assets of the employer. Moreover, in all of these countries the laws requiring the immediate report of accidents to public authority are explicit, and as a rule well enforced.

The cost abroad is found to vary much with the system. In England, where private insurance companies have occupied the field, the cost is 100 per cent. of the actual compensations paid, but in Norway, Austria, and Germany, where state insurance departments have been organized, the cost is only 16 per cent. of actual payments made. See **WORKINGMEN'S INSURANCE**.

BIBLIOGRAPHY. In addition to an abundant magazine literature on this subject there have been published the following: By Crystal Eastman, *Work Accidents and the Law* (1910); by Frankel and Dawson, *Workingmen's Insurance in Europe* (1910); *Workingmen's Insurance and Compensation Systems in Europe*, issued as the twenty-fourth annual report of the United States Commissioner of Labor; and reports by the commissions of Massachusetts, Minnesota, New Jersey, Ohio, Illinois, New York (1910), Washington, and Wisconsin.

ENTOMOLOGY. GIPSY MOTHS, ETC. The problems of economic entomology were attacked with as much vigor in 1911 as in previous years. In the United States, the most important of these were connected with the control of the cotton boll weevil, the alfalfa weevil, the gipsy, and brown tail moths. The fight against the brown tail was reported by Marlatt to be complicated by the fact that much infested nursery stock is brought to the United States from Europe, where inspection is often not very thorough. The greatest care, therefore, should be exercised in inspecting all imported stock. While spraying and burning may help to keep these moths down, the only satisfactory solution seems to be the discovery of some natural parasites. A large number of these have been liberated in the United States, but no beneficial results have thus far been reported. As was pointed out by Wheeler, attempts of this sort are complicated by the fact that in transferring a parasitic insect to a new habitat, one can never be certain that it will not entirely change its habits.

TSETSE FLIES. E. E. Austin published a *Handbook of the Tsetse Flies*, as a revision of the species now numbering fifteen. The genus attains its maximum development in the humid region of equatorial Africa, and probably all of its members are potentially capable of carrying disease. It has been suggested that the larger mammals are the chief intermediate hosts of the trypanosomes carried by these insects, and that by exterminating these mammals, the disease could be eliminated. The general belief, however, was that the flies infect mammals other than man only under laboratory conditions, and that there is no reason to think the

proposed measures would be of any great value. The bionomics of the insect are, however, imperfectly known.

The African Entomological Research Committee, founded in 1909, is studying especially the disease-carrying insects of Africa. It was announced in 1911 that Mr. Andrew Carnegie had given £1000 a year for three years to pay the expenses of sending young men to the United States to study practical applications of entomology. The third bulletin of the Sleeping Sickness Bureau gave an account of the discovery of the intermediate stages of the *Trypanosome lewisi* of the rat, in the rat flea. The intermediate stage is passed in the epithelium of the rat's stomach.

ANTS. Emery stated that probably new colonies of the Amazon ant, *Polyergus rufescens*, are started by the fertilized female working her way into a nest of *Formica rufa*. The intruding queen if not stopped by hostile workers goes to the domicile of the reigning queen and kills her. She is then accepted as legitimate queen by the *Formica* workers, and in the second year lays eggs which develop into *Polyergus* workers.

TERMITES. Escherich published a valuable report on the termites of Ceylon. Two species may inhabit the same termitarium, though living in galleries which do not directly communicate with one another. If openings are made from one of these to the other, the animals show decidedly hostile relations. These nests may, therefore, be called compound rather than mixed. *Eutermes monoceros* march in long processions to the feeding grounds, the workers and soldiers, which are blind, finding their way by means of faecal masses deposited by the foremost workers in the procession. The licking of the queen by the workers is quite as much for food from an exudate secreted by the queen as for cleansing purposes.

EPILEPSY. Spangler, of Philadelphia, made a second report on the use of rattlesnake venom in epilepsy. He was led to try crotalin on no other grounds than the observation that a man had been cured of epilepsy by the bite of a rattlesnake. Thirty-six cases are included in the present report. In a few the disease has been apparently cured, no attacks having occurred in two years. The author is convinced that the treatment, if used with care and intelligence, modifies the severity of epileptic attacks, lengthens the intervals between seizures, and has a beneficial effect on the mental and physical condition of the patient. The form of epilepsy most favorably influenced by the venom is the so-called idiopathic or genuine epilepsy, for which there is no ascertainable cause. The patient may be subject either to major or minor attacks (*grand mal* or *petit mal*). In some cases the *grand mal* attacks are modified into *petit mal* seizures. Organic epilepsy arising from traumatic lesions of the skull or brain, or associated with focal organic diseases of the brain, such as tumors, do not respond to the crotalin treatment. Epilepsy arising from alcoholic or uremic poisoning also is not influenced. The drug is prepared by dissolving in sterile water, to which a preservative antiseptic has been added, the dried scales of venom from the *Crotalus horridus* or American rattlesnake. This solution is injected in minute but increasing doses into the muscular tissues. As the disease is controlled, the interval

between injections is lengthened from a few days to weeks or even months. In no case, however, has treatment been suspended altogether.

The field workers of the New Jersey State Village for Epileptics at Skillman canvassed 13 counties of the State and found in the families of 137 patients, 328 epileptics, an average of 2.4 for each family. The total number of defectives studied was 1253. Inheritance was found to be: Alcoholism, 69; blindness, 18; Bright's disease, 22; cancer, 27; crime, 5; deafness, 25; epilepsy, 57; feeble-mindedness, 29; insanity, 37; migraine, 12; neuroses, 30; paralysis and apoplexy, 43; suicide, 9; syphilis, 4; tuberculosis, 75. Of 30 children whose fathers and mothers were inmates of the institution, 6 were epileptic, 2 feeble-minded, 2 insane, 3 died in infancy, 3 neurotic, 1 tuberculous, 4 undetermined, and 9 normal. The charts also show that in cases in which the parents are both epileptic or feeble-minded, or one epileptic and one feeble-minded, all the children were feeble-minded or epileptic. Another study of charts of the most completely known pedigrees shows that the normal parents of epileptic offspring have come from families with defective ancestry. The report emphasizes the fact that in view of the showing that heredity plays such a large part in the production of these defectives, the State should protect itself by the passage of laws which would prevent a reproduction of other epileptics. This might be accomplished either by placing the afflicted under permanent custodial care or by sterilization of all epileptics.

ERICHSEN, MYLIUS. See POLAR RESEARCH.

ERITREA. An Italian colony on the African coast of the Red Sea. Area (estimate), 73,700 sq. miles. Population (largely nomadic), estimated at 450,000. Imports and exports (1908), 11,433,322 and 5,622,295 lire respectively. Estimated revenue for 1910-11, 8,977,750 lire (colonial revenue, 2,627,750; state subvention, 6,350,006); expenditure, 7,223,700 (military, 3,988,200; civil administration, 3,235,500). Governor in 1911, Marquis Giuseppe Salvago Raggi. The DAHLAK ARCHIPELAGO (an important pearl fishery) is attached to Eritrea.

ERSKINE, SIR JAMES ELPHINSTONE. An English admiral, died July 25, 1911. He was born in 1838, and entered the Royal Navy in 1852. In 1868 he was made a captain. From 1888 to 1891 he was senior officer on the coast of Ireland. He was promoted to be vice-admiral in 1892. In 1895 he served as commander-in-chief of the North American and West Indies Station. Two years later he received the K. C. B. and was made an admiral. He was appointed a commissioner in 1898 to inquire into the matters relating to the French treaty rights in Newfoundland. From 1901 to 1902 he was first and principal A. D. C. to King Edward. In the latter year he was made admiral of the fleet and retired.

ETHICAL CULTURE, SOCIETIES FOR. The parent society was established in New York in 1876 by Felix Adler. Others were later established in Philadelphia, Chicago, St. Louis, Brooklyn, and elsewhere. The object of the society is to unite people of varying religious

beliefs or none, in the ordinary acceptance of the term, upon a basis of a devotion to the moral ideal. Interpreting the word "religion" to mean fervent devotion to the highest moral ends, the society is to be regarded distinctly as a religious body. But toward religion as a confession of faith in things superhuman, the attitude of the society is neutral. Neither acceptance nor denial of any theological doctrine disqualifies for membership. A recognition of the supremacy of the moral ideal and of the independence and sovereignty of the ethical factor in life is alone insisted upon as a basis of membership. The New York society is engaged in various forms of educational and philanthropic activity. Education has, from the first, been its chief care. Early in its history it established one of the first free kindergartens, and that has grown to the dimensions of the present Ethical Culture School. The membership of the New York society is about a thousand. The other societies are smaller, but are, most of them, engaged in educational and philanthropic work along the lines of the New York society. These societies are federated in the American Ethical Union, which conducts the *International Journal of Ethics* and a Summer School of Ethics, besides attending to the publication of the literature of the movement. This union is in turn related to the International Ethical Union which, at a congress at Eisenbach, Germany, in 1906, adopted as its basis, this declaration: "The general aim of the union is to assert the supreme importance of the ethical factor in all the relations of life, personal, social, national, and international, apart from all theological and metaphysical considerations." The societies for ethical culture hold regular Sunday meetings, Sunday schools, and various classes. Among the organizations of the parent society in New York are the Women's Conference, the Young Women's Union, the Hudson Guild, and the Down-Town Ethical Society.

A new meeting-house for the society, adjoining the Ethical Culture School, Central Park West and 63d Street, was dedicated in 1910, and is used for Sunday service and other meetings of the society.

The officers of the New York society in 1911 were: Felix Adler, leader; John Lovejoy Elliott, David Saville Muzey, Henry Moskowitz, and Alfred W. Martin, associate leaders. The Philadelphia Society for Ethical Culture is presided over by S. Burns Weston as leader, the St. Louis society by Percival Chubb, and the Brooklyn society by Dr. Henry Neumann.

EVANGELICAL ASSOCIATION. A religious denomination, founded in 1800 by Jacob Albright as the result of evangelical work among the Pennsylvania Germans. The movement arose out of the desire of Albright to preach the Gospel among his German compatriots. This resulted in the formation of an organization which was at the time the only agent of vital

evangelism among the Germans of the United States. The denomination in general has adopted the doctrine and polity of American Methodism, but modified it in the direction of greater democracy. Although its work was originally carried on among the Germans, it is rapidly becoming predominantly English in the United States. It has spread over all the northern part of the United States and Canada, extended to the Pacific coast and southward to the Virginias and Texas. It carries on work among Italian immigrants. There were in the United States and Canada in 1911 24 annual districts, 116,507 members, 1463 ministers, and 1800 church edifices, with a valuation of \$10,000,000, and 175,000 members of the Sunday schools. The Young People's Alliance, connected with the church, has 44,000 members. The denomination contributed in 1911 \$275,000 for home and foreign missions. It has a church extension board, with a fund of \$100,000, raised in the last four years. The denomination maintains a publishing house at Cleveland, O., an orphan home at Flat Rock, O., deaconess homes and hospitals in Chicago and Philadelphia, a hospital in Bismarck, N. D., and various other institutions throughout the Middle West and elsewhere. The Northwestern College at Naperville, Ill., is its chief educational institution, while the Evangelical Theological Seminary at the same place is the principal school for the education of ministers. The chief organs of the church are the *Christliche Botschafter* and the *Evangelical Messenger*. The church also publishes a series of young people's literature and Sunday-school helps in English and German. Work is carried on in Europe, especially in Germany and Switzerland. In Europe there are 24,000 members. A publishing house and theological seminary are maintained. Recently work has been begun in Russia. The total membership of the church is 141,000 and the total number of Sunday-school scholars 187,000. The church has four bishops. Missionary work is carried on in China.

EVANS, ELIZABETH EDSON. An American author, died September 14, 1911. She was born in Newport, N. H., in 1832. Her parents removed to Ann Arbor, Mich., in 1841, and she was educated in the private schools of that city. She began to write early both prose and verse for the newspapers. She married in 1868 Edward Payson Evans. She removed to Germany with her husband in 1870 and studied in that country until the time of her death. She was the author of *The History of Religions* (1892); *The Story of Kaspar Hauser* (1892); *The Story of Louis XVII. of France* (1893); *Transplanted Manners* (1895); *Confession* (a novel, 1895); and *The Christ Myth* (1900). She also contributed to many American and English reviews, magazines, and newspapers.

EXPLORATION. (For Arctic and Antarctic, see POLAR RESEARCH.) In 1907 Captain Arnaud crossed the Sahara from Algeria and the little known region south of the northern bend of the Niger to the Gulf of Guinea. Lieut. Boyd Alexander studied Lake Chad and the rivers between the Niger and the Nile. Rich results were obtained by R. Chudeau in his journey for geological and geographical study

across the Sahara to Zinder and Timbuktu. Hanns Vischer visited the Kufra oases, the present centre of the fanatical Senoussi sect, the second explorer to gain access to this forbidden region. Maj. Powell Cotton made a very careful study of the dwarfs in the Ituri Basin, Belgian Congo. Commodore Whitehouse completed his topographical survey of the coasts of the Victoria Nyanza.

In 1908, Dr. Sven Hedin completed his exploration in western Tibet. His chief results were the survey of the main topographical features of the whole of western Tibet, the discovery of part of the Trans-Himalaya Range and the discovery and exploration of the main upper branch of the Indus River. The work engaged him for three years. Dr. M. A. Stein, on his second series of explorations in Central Asia, mapped 17,000 sq. miles of mountain land in the Chinese province of Kansu and along the northern and eastern borders of East Turkestan. He found many more ruins of ancient towns, etc., and fifty camels were required to transport his collections. The French continued their explorations in the Sahara and added several volumes to the literature of that region. The Duke of Mecklenburg arrived at the mouth of the Congo after a thorough scientific study of the great volcanic region (the Virunga district) in central Africa, between Lakes Tanganyika and Edward. The work of this party was of the highest merit. Dutch explorers were active in the southern part of Dutch New Guinea and it was proven that the Charles Louis Mountain Range extends much farther east than had been supposed, and has many snow-crowned peaks.

In 1909 it was discovered that the most extensive coal fields in Canada embrace about 20,000 sq. miles of Alberta. Mrs. Fanny Bullock Workman sent French experts to Huascarán, one of the great mountains of Peru, who proved that its north peak is 21,812 feet in height and its south peak 22,187 feet, thus disproving the assertion that Huascarán is the highest summit in South America. The detailed study and mapping of many areas in Africa was the chief work in that continent.

In 1910 a series of short railroads was completed around the rapids of the upper Congo, so that there are now 2250 miles of continuous steam transportation by river and rail between the Congo mouth and the Kalengwe Falls. Chinese trained field surveyors began a topographic survey on the lower Yangtse River, and issued a number of very creditable topographic sheets, which, however, are not yet intended for distribution. Two Russian parties began the survey of the coast line of northwestern Siberia. The Trans-Andean Railroad, between Buenos Ayres and Valparaiso was opened to trade on May 25.

NORTH AMERICA. In 1911 the United States Coast and Geodetic Survey completed a great arc of primary triangulation, more than 1200 miles in length, extending from central Texas to the Pacific coast. It connects the 98th meridian primary triangulation near Weatherford, Tex., with the Pacific coast primary triangulation near San Diego, Cal. It supplies the geographic positions of more than two hundred points, which can be used to control all future public surveys within the region traversed. The United States Geological Survey is rapidly publishing bulletins giving the results of spirit leveling in the various States. The report for the

State of Washington, for example, gives the exact elevations above mean sea level of about 1700 points in different parts of the State. The State geological surveys are increasing their activities. Thirty-six of our States recognize geological work as a necessary and proper governmental function, and have organizations to carry on such endeavor. Many of these surveys are publishing detailed reports, which give much accurate information as to the geography, geology, and resources of their States. Some of the reports, notably those published by the Wisconsin and Illinois surveys, are written largely for the general public and school instruction. The United States Geological Survey has engraved a topographic map of the new Glacier National Park. This splendid playground covers nearly a million acres in northwestern Montana, just south of the Canadian line. There are more than sixty glaciers in the park, some of them several square miles in area. New deposits of phosphate have been discovered by this survey. The area of phosphate lands now withdrawn from public sale is over 2,500,000 acres, containing many hundred million tons of phosphate rock and having a very great potential value to the farming industry.

The Canadian Department of the Interior has published the results of its investigation as to the economic value of the country to the north of the north Saskatchewan River. The large map published with Mr. Crean's report shows that the territory studied embraces most of the region between 54°-57° north latitude and 104°-113° west longitude. Mr. Crean estimates that in the eastern half of this area there are 5,000,000 acres suitable for settlement as soon as surveyed and made accessible by roads; and an area of about 12,000,000 acres of swamp or land too wet at present for cultivation may be reclaimed at little expense. Wheat may be grown in almost any part of this northern region. Of course, the likelihood of summer frosts is increased in these northern latitudes, but wheat, barley, and oats are now maturing there every season. Canada, it is believed, has a large reserve for settlement in this north country, which before many years, will have steam connections with the settled area to the south. The Canadian territory in the far West traversed by the Grand Trunk Railroad, now being built to the Pacific, has been carefully studied in relation to its economic resources. A large part of the region is said to be good wheat-growing, mixed farming land and there is excellent land for 150 miles west of Edmonton. Good farm land also prevails on both sides of the line that has been extended through the clay belt of northern Ontario.

SOUTH AMERICA. Professors Bingham and Bowman have returned from Peru, where they very successfully carried on the work of the Yale Peruvian Expedition. Among the most important results were the physiographic study of a belt of country extending from the Amazon to the Pacific, across the Andine cordillera, observations as to the effect of topography and precipitation upon the position of the snow line, soil and water supply studies in relation to vegetation, research with special reference to the distribution of people, etc.

Maj. P. H. Fawcett of the British army, who assisted in determining the disputed boundary between Bolivia and Peru, followed the little-known Heath River for 300 miles on foot and in

canoes. The topography of this region had heretofore been conjectural, the map showing mountains where rivers should be placed and *vice versa*. The river forms a part of the new boundary.

The exploration of southern Dutch Guiana, in which seven expeditions have been engaged during the last fifteen years, has now been brought to a close as the last unknown area has been eliminated from the map of the colony.

Dr. Koch-Grünberg has returned to the upper Amazon Basin to penetrate the headwaters of the Yapurá River, and to explore the region on the divide between the Orinoco and Amazon systems and their affluents. This explorer, though chiefly interested in ethnology, has done much geographic work of the first order in his field explorations. It was he who traced and mapped, several years ago, the entire headwaters of the Rio Negro.

Dr. Wilhelm Sievers believes that he has discovered the true headwaters of the Marañón, or in other words the ultimate source of the Amazon. He says the great explorer Raimondi was mistaken when he announced the Nupe as the most important of the three rivers whose united waters form the upper Marañón. He found that the Lauicochar carries much more water, extends farther south, and is the greatest of the Marañón sources. He traced this river to its ultimate springs on a snow mountain called San Lorenzo, in the Cordillera de Huayhuash, and to the lagoons Santa Ana, Caballo Cocha, Anka Cocha, and Tinka Cocha, about 15,580 feet above sea level.

AFRICA. The Benué River, the largest tributary of the Niger, is now completely explored, Captain Strimpel having surveyed the last unknown stretch of it. It has taken sixty years to reveal the whole course of the river, which is notable as being the only river in Africa that affords (with the lower Niger) a navigable waterway between central Africa and the Atlantic.

The Duke of Mecklenburg has returned to Germany after a year spent with a well-equipped party in the Lake Chad region, Bagirmi, the northern Belgian Congo, and Kamerun. The detailed results are expected to be important.

The French extended their military reconnaissances into the western Sahara, south of Morocco, in territory that was almost entirely unknown. The region lies between 29° 30' and 27° 30' N. and 5° 10' and 2° 10' W. Several springs and pasturages were discovered that will prove important to the caravan trade, and the position of the stony desert and of the two main sand deserts of the western Sahara were determined.

Map making and railroad extension are making rapid progress in nearly all the African colonies. A branch of the Cape to Cairo Railroad is now in operation, between Broken Hill in northeastern Rhodesia and Elizabethville, in the copper region of southern Katanga. Among the other important enterprises is the railroad which is now building through the great cotton area of Northern Nigeria, with a branch extending to the Bauchi Highlands in the centre of the protectorate, which have now been determined to be among the great tin mining regions of the world. The Madagascar Railroad is being extended and in 1913 it will connect Tamatave, the principal port, with Antananarivo, the capital, a city of over 100,000 inhabitants. The

completed railroad will be about 230 miles long. See article RAILWAYS, AFRICAN.

ASIA. Owing to the hostility of the Abor and other mountaineers on the Assam-Tibet borderland, a stretch of the Tibetan Sangpo river, which is the upper course of the Bramaputra, has never been explored. It has been described as "the part of the Brahmaputra, which is still drawn by guess work on our maps." About ninety miles of the river are still unknown. In 1910, a small British party attempted to enter this unknown district, but was stopped by the Abors. A little later Mr. Noel Williamson, with about 200 natives, undertook to trace the unknown course of the river, but was attacked by the natives and massacred, with all his men. The British government has sent a punitive expedition against these mountaineers strong enough, it is believed, to reduce them to submission.

Prof. W. Volz of Breslau University gives the results of his study of the primitive Kubus, who inhabit the central forest region of southern Sumatra between 2° and 3°S. A part of these people are so completely isolated from all exterior influences that they seem to be the most primitive of human beings. The life of the Kubus is compared by the explorer to that of the gibbon, an anthropoid ape that inhabits the same region. He even appears to be destitute of rudimentary religious conceptions.

AUSTRALASIA. The Dutch and British expeditions in Dutch New Guinea have resulted in better knowledge of the southern part of that island. Dr. Lorentz, in charge of the Dutch expedition, and Captain Rawling and his party both entered the island from the south coast, Lorentz reached the Snow mountains and ascended Wilhelmina Peak and Rawling studied the coastal region as far as the mountains. These parties found that the south coast consists of a large alluvial plain cut by a great number of rivers and almost impassable for whites in the rainy season. The Papuans of the plains and those of the mountains live in the Stone Age, none of them wear clothing, but their food and habits of life are greatly affected by the difference of their geographical habitat. Captain Rawling says that the land, from the sea to the mountains, is impossible for anyone excepting a Papuan to live in. Both expeditions found pygmies.

EXPLORATION, DEEP SEA. See BIOLOGY.

EXPOSITIONS. During the year no important expositions were held in the United States. Of minor importance was the Appalachian Exposition held in Knoxville, Tenn., from September 11 to October 1, at which exhibits were shown from all the southeastern States, indicative of their resources and wealth of agriculture, minerals, and industries.

The centennial celebration of the victory of Commodore Perry on Lake Erie will be held in September, 1913. In October final details for the construction of a memorial at Put-in-Bay and the selection of an architect to design the monument were announced by the commission. The memorial will consist of a lofty monument bearing a light to aid navigation, and at its base a museum for historical relics, standing in a reservation of fourteen acres. The sum of \$800,000 is available for the memorial and \$100,000 for the grounds. The opening exercises will be held in Cleveland, O., during the week of June 22, 1913.

The selection of San Francisco, Cal., by Con-

gress, as the most desirable site for the International Exposition to be held in 1915 in commemoration of the opening of the Panama Canal, led the Panama-Pacific International Exposition to organize a directorate with Charles C. Moore as president and Rudolph J. Taussig as secretary. The fifteen million dollars which Congress required to be raised before the President invited foreign nations to participate was underwritten by banks in San Francisco. In July a decision as to the sites was announced. The industrial buildings and other temporary structures will be placed at Harbor View on the bay shore, overlooking the entrance to the harbor. All permanent buildings will be placed in Golden Gate Park, excepting an enormous convention hall to be situated at the civic centre of the city, Van Ness Avenue and Market Street. Other permanent improvements will be made along the whole water front from Cliff House, on the ocean, to the ferry building on the bay. A part of the fair will be placed in Lincoln Park which stands on the most westerly point of the city, overlooking the Golden Gate itself. The various parts of the exposition will be connected with each other by boulevards, along which a street railway will run. Advantage was taken of the presence of President Taft in San Francisco on October 14, for the breaking of ground for the exposition, and that event was celebrated with appropriate ceremonies, including a parade, participated in by military forces of the army and navy and of the State, and by a banquet in the evening.

The Panama-California Exposition will be held in San Diego, Cal., from January 1 to December 31, 1915. A corporation with U. S. Grant, Jr., as its president, and L. G. Monroe as its secretary has been organized, who have chosen D. C. Collier as director-general. A fund of over \$2,250,000 has been raised. A site of 1400 acres has been selected in Balboa Park in the centre of the city, near the business district, and where the beginning of the construction work was signaled by pressing a button in the White House by President Taft, on July 19, while at the same time Hon. John Barrett as the personal representative of Mr. Taft turned the first sod at the ground-breaking exercises in Balboa Park.

The authorities of the Philippine Islands announce that the annual Carnival Festival held each year in Manila during February will in 1912 be celebrated by an exposition at which the products, manufactures, and minerals of the islands will be shown. The government of the islands has appropriated \$25,000 for the annual exposition and for the purchase of exhibits there made, and \$5000 is allowed for the permanent staff organization. The better and more permanent exhibits will be placed in the Museum of the Philippine Islands which is now being established.

ITALY. The fiftieth anniversary of the proclamation of the kingdom of Italy was celebrated by an international exposition, of which the exhibits in industry and labor were shown in Turin, and those pertaining to history, archaeology, and art in Rome. The purposes of the Turin Exposition were to present the development of the reconstructed kingdom of Italy by exhibiting its achievements in art, science, and technology, and also to show the resources of the world, by exhibiting the arts, crafts, and trades of other countries. The site chosen was

in Valentino Park, a woodland tract of 250 acres, through which the river Po flowed, and almost in the heart of the city. The river was spanned by four bridges, and motor boats furnished ready means of reaching the exhibits. There were 125 buildings covering 75 acres in which more than 15,000 exhibitors showed important products from the principal countries of Europe, nearly every one of which had special buildings. Argentina, Brazil, and the United States had separate buildings, while Chile, the Dominican Republic, Ecuador, Peru, Uruguay, and Venezuela grouped their exhibits in a building erected for Latin America. The United States building, though not so large as those of the principal European governments, was a creditable edifice erected on the river bank. It was 650 feet in length, of classic design, with sufficient ornamentation to make it impressive. See AGRICULTURE.

A broad promenade extended along the river bank in front of the buildings. The interior decorations were artistic and effective and the arrangement of the floor space was well adapted for advantageous display of exhibits. An allegorical painting by Theodore E. Butler, in the reception room, symbolized America's welcome to all comers. The Turin Exposition was inaugurated on April 30 with appropriate ceremonies, including the presence of the king and queen of Italy, as well as other members of the royal family and important dignitaries. The exposition continued open until October 31.

The site chosen for the exhibition of fine arts in Rome was on the grounds of the Villa Borghese. Twelve pavilions in which were shown the art of twelve countries, including the United States, were erected. There was also an historical section in the castle of Sant' Angelo, where life in Rome during the Middle Ages was presented, and an archaeological section was held in the recently restored Diocletian's baths where the results of the more important excavations in Rome were shown. These exhibitions were formally opened on March 27 and continued until December 1.

Congress on May 6, 1910, appropriated \$150,000 to enable the United States to participate in these expositions. Francis B. Loomis was appointed commissioner for the exhibit in Turin, and Harrison S. Morris for the exhibit in Rome.

JAPAN. Preparations for the international exposition to be held in Tokyo in 1917 have been steadily progressing. A competition has been announced for the general plan of exhibition installations, for which prizes will be given for three selected designs. The city of Tokyo has granted \$3,500,000, of which sum \$1,500,000 is for the acquisition of the site, \$1,250,000 for constructing gardens, and \$750,000 for an adequate tram, train, and cab service, for sanitary arrangements, and for the preliminary expenses for plans, guides, etc.

EYTINGE, ROSE. An American actress, died December 20, 1911. She was born in Philadelphia in 1835 and made her first appearance on the stage in a one-act play by Dion Boucicault entitled *The Old Guard*. After ten years with stock companies she appeared in 1862 with Edwin Booth in *A Fool's Revenge*. In 1868 she became leading woman in Lester Wallack's Company. After a period abroad she returned to the United States, appearing in *The Heart of Midlothian*. For several years she

was with Augustin Daly and then joined A. M. Palmer's Company at Union Square Theatre, New York city. She then played in Philadelphia and in San Francisco. After 1884 she appeared rarely on the stage. In 1870 her husband, George H. Butler, was appointed consul-general in Egypt and she lived in that country for several years. She wrote many years later *The Memories of Rose Eytinge*, which contained accounts of her Egyptian life. For a time she lived in London, and among her friends were Charles Dickens, Wilkie Collins, Gladstone, Lord Rosebery, and Charles Reade.

FAILURES IN 1911. See FINANCIAL REVIEW.

FALCONIO, DIOMEDE. An American Roman Catholic archbishop, created cardinal in November, 1911. He was born at Pescocostanzo in the Abruzzi, Italy, in 1842. He entered the Franciscan order in 1860, and on the completion of his studies in 1865 was sent as missionary to the United States. He was ordained priest in 1866 and in the same year became professor of philosophy and vice-president of St. Bonaventure's College at Allegheny, N. Y. In the year following he was appointed professor of theology and secretary of the Franciscan Province of the Immaculate Conception. He was appointed president of the college and seminary of St. Bonaventure in 1868 and in the same year became a citizen of the United States. From 1872 to 1882 he was secretary and administrator of the Cathedral of Harbor Grace, Newfoundland. He returned to Italy in 1883 and was elected Provincial of Franciscans in the Abruzzi. He became in 1888 commissary and visitor-general of the province of Naples. After holding other higher offices in the Franciscan order he was consecrated in 1892 bishop of Lacedonia and was raised in 1895 to be archbishop of Acerenza and Matera. From 1899 to 1902 he served as apostolic delegate to Canada. In the latter year he was appointed apostolic delegate to the United States. He is the author of a volume of *Pastoral Letters*. He was one of three American archbishops created cardinals at the consistory of 1911.

FALKLAND ISLANDS. A group of islands in the south Atlantic; a British crown colony. Area, 6500 sq. miles; of South Georgia, a dependency, 1000 sq. miles. Population (estimated 1910), exclusive of the South Georgia whaling settlement, 2356. Capital, Stanley, with 800 inhabitants. The chief industry is sheep farming. Acres in pasture, 2,325,154; sheep (1909), 715,651. Imports (1910), £94,294; exports, £308,930 (wool, whale oil, guano, tallow, hides, sheepskins, etc.). Tonnage entered and cleared (1910), 336,000. Revenue and expenditure (1910), £18,535 and £17,405. Governor (1911), W. L. Allardree; colonial secretary, T. A. Vans Best (acting). Besides South Georgia, other dependencies are the South Shetlands, the South Orkneys, the Sandwich group, and Graham's Land.

FARLEY, JOHN MURPHY. An American Roman Catholic archbishop, created cardinal in November, 1911. He was born at Newton Hamilton, County Armagh, in 1842. He was educated at St. Marcartan's College, Monaghan, and at St. John's College, Fordham, N. Y. He studied law at St. Joseph's Seminary at Troy, N. Y., and spent four years in the American College at Rome. In 1870 he was ordained a

priest in Rome. For the two years following he served as assistant rector at St. Peter's Church, New Brighton, N. Y. From 1872 to 1874 he was assistant secretary to Archbishop McCloskey. In the following year he was appointed private chamberlain to Pope Leo XIII., with the title Monsignor. He became in 1891 vicar-general to the archbishop of New York. In the year following he served as domestic prelate to Pope Leo XIII. He was appointed prothonotary apostolic in 1895 and in the same year was made auxiliary bishop of New York. In December of the same year he was consecrated titular bishop of Zeugma. On the death of Archbishop Corrigan in 1902 he received the appointment of administrator of New York, and in September of the same year he became the fourth archbishop of New York. He was one of the three American archbishops who were appointed cardinals at the consistory of 1911. He is the author of *Life of Cardinal McCloskey* (1899-1900), and has contributed articles on controversial and other subjects to magazines.

FARMAN, ELBERT ELL. An American lawyer and diplomat, died December 30, 1911. He was born in New Haven, Oswego county, N. Y., in 1831, and graduated from Amherst College in 1855. He studied law and in 1858 was admitted to the bar. For several years he traveled in Europe and studied languages and international law at the universities of Berlin and Heidelberg. From 1868 to 1875 he was district-attorney of Wyoming county, N. Y. He was diplomatic agent and consul-general of the United States at Cairo, Egypt, from 1876 to 1881, and in 1880-81 was a member on the part of the United States of the international commission to revise the judicial codes of Egypt for the use of mixed tribunals. In 1883-4 he was a member of the international commission which examined the claims and determined the amounts to be paid to inhabitants of Alexandria for losses arising from the bombardment and burning of that city in 1882. He secured the obelisk known as "Cleopatra's Needle" as a gift of the khedive of Egypt to the city of New York in 1879. His large collections of ancient coins and Egyptian antiquities were given to the Metropolitan Museum of Art. For many years he delivered political addresses during presidential campaigns. In 1872 he was a delegate to the Republican national convention. He received a decoration from the khedive of Egypt. He was the author of *Along the Nile with General Grant* (1904) and *Egypt and its Betrayal* (1908).

FATIGUE. Long before the real nature of infection was known, the influence of fatigue on the course and development of infectious disease was recognized. Some of the earlier veterinarians noted that overexertion preceded glanders or anthrax in horses and cattle. According to Roger, fatigue plays an important rôle as a predisposing cause of typhoid fever. Thus military surgeons note that soldiers, while in garrison they may be free from typhoid fever, are liable to develop it after they have undergone the strain of manœuvres. Charrin and Roger twenty years ago published their

classical work on the breakdown of resistance to infection after physical exhaustion. They experimented on white rats, using the bacillus of anthrax. The experimental animals were first made to run in a squirrel's cage for several hours until thoroughly tired, and were then inoculated, control rats being injected with an equal dose. It was found that the fatigued rats succumbed to the infection earlier than the non-fatigued, and that in some cases the latter survived a dose sufficient to kill the former in less than twenty-four hours. In one experiment, five control rats injected with the virus of symptomatic anthrax survived, while all of the six fatigued rats inoculated with the same amount died, three of them in less than twenty-four hours. Recent advances in the study of immunity have illuminated the subject still more. Desandro of the University of Naples repeated the work of Charrin and Roger. He used as his subjects dogs, rabbits, and guinea pigs, with typhoid toxin for the infective material. He not only confirmed their results, but demonstrated some of the changes which take place as the result of fatigue, which seems to explain the loss of resistance to infection. The investigator tired his animals by means of faradization, carried to the point of rapid contractions, but without causing pain or extreme terror. Each series of animals experimented on consisted of four classes: Class 1, containing those which were fatigued by faradization each day for five to seven days before injection; class 2, those which were tired just prior to injection and then daily after injection; class 3, those which received the injection in a normal state and were then fatigued occasionally at intervals of several days; and class 4, those injected and left to rest—the controls. After ten days, the animals, if living, received a second dose. Desandro set out to ascertain the effect of fatigue on the duration of life, the body, weight, temperature, character, and number of leucocytes, the formation of agglutinin, opsonin, precipitin antitoxin, anti-endotoxin, and bactericidin. With regard to the last five substances, his experiments were not conclusive, but he was able to demonstrate decided changes in the mechanism of resistance as a result of over-fatigue. All the animals which were subjected to fatigue died sooner than the controlled, death coming more quickly in those which received the first injection in a state of exhaustion than in those which were exhausted only after injection. Loss of weight was greatest in those animals which were fatigued rapidly before injection. One guinea pig lost 245 grams, while the control lost only 105 grams. A dog lost 1500 grams, while the control lost only 200 grams. In all the injected animals, whether fatigued or not, injection of typhoid toxin was followed by typical changes in the number of leucocytes, namely an immediate diminution followed by an increase and then a return to the normal count. Desandro found that the protective elements of the blood were lowered more markedly in the fatigued animals than in those at rest. The leucocytes (white corpuscles) were reduced in a greater degree after injection, with only a slight rise subsequently. The results of Desandro's observation on an agglutinin formation are also very interesting. He found that the slight agglutinative power of all the serums disappeared after the first injection (negative phase). The serum of the control

animals began to show agglutinative power by the third to the fifth day, that of the fatigued animals not until the fifth to the eighth day, animals of class 1 being always the slowest to respond. All the control animals exceeded the fatigued in the amount of agglutinin formed. Desandro concludes that overfatigue greatly favors the development of infectious processes by its effect on the defensive mechanism of the body.

FAUNCE, DANIEL WORCESTER. An American Baptist clergyman and scholar, died January 3, 1911. He was born in 1829 and graduated from Amherst College in 1850. He studied at the Newton Theological Seminary, graduating in 1853. In the same year he was ordained to the Baptist ministry. He was pastor of churches in Worcester, Mass., Concord, N. H., Washington, D. C., Pawtucket, R. I., and other cities, and was a member of the Board of Managers of the American Baptist Missionary Union. He was the father of W. H. P. Faunce, president of Brown University. He was a prolific writer. Among his published works are *Words and Works of Jesus* (1873); *Words and Acts of the Apostles* (1874); *A Young Man's Difficulties with His Bible* (1877); *Hours with the Skeptic* (1889); *Advent and Ascension* (1893); and *Shall We Believe in Divine Providence?* (1900).

FEDERATED MALAY STATES, THE. A British protectorate in the Malay Peninsula, composed of four states, as follows:

AREA AND POPULATION. The four states, with their area and population in 1911 are: Perak, 7900 square miles, 494,123 inhabitants; Selangor, 3200, 294,014; Negri Sembilan, 2550, 130,201; Pahang, 14,100, 117,595. Total area, 27,750 square miles; population, 1,035,933. Largest town, Kuala Lumpur (47,000 inhabitants), in Selangor. The newly ceded portion of Petani called **REMAN** or **Rahman**, formally taken over from Siam, July 16, 1909, and incorporated in the district of Upper Perak, extends from Kedah to Legeh and contains about 1000 square miles (population, 3000). In it are situated the Klian Intan mines. The whole length of the Perak River is now included in the state. Schools (1910) 356, with 21,967 pupils (327 Malay vernacular, with 16,640). Kuala Lumpur has a very complete institute for medical research.

PRODUCTION. Area alienated under permanent title, 1,492,604 acres (1,174,803 agricultural, 312,499 mining); forest reserves, 479,740. Area in 1909 under rubber, 230,069 acres; (Selangor, 100,637; Perak, 68,278; Negri Sembilan, 44,883; Pahang, 20,271); under rice, 155,205 (Pk. 75,346; Pg., 36,793; N. S., 33,954; S., 9112); coconuts, 122,291 (Pk., 63,225; S., 24,294; N. S., 19,037; Pg., 15,735); under gambier, 60,000 (S., 30,000; N. S., 21,000); under tapioca, 11,083 (N. S., 8750; Pg., 2262); under coffee, 11,270 (S., 10,645; N. S., 324); under sugar, 7126 (Pk., 7000); under pepper, 1913 (S., 1250); under various crops, 36,382.

The total revenue from all mines in 1909 was

7,694,231 S. S. dollars (1 Straits Settlements dollar=56.7758½ cents). Total output of tin (1909), 818,888 piculs (1 picul=133½ lbs.) of which 180,586 piculs were exported as block tin and 638,302 as tin ore. Perak contributed 115,376 piculs tin and 346,289 tin ore (including 5000 piculs from Reman); Selangor, 49,022 and 216,984; Negri Sembilan, 4533 and 43,537; Pahang, 11,654 and 31,490. Sterling value of total output, £6,496,509. Gold output (1909, 16,243.6 ounces (Pg., 14,887.6; Pk., 1279; N. S., 77)).

COMMERCE, FINANCE, ETC. Trade and finance statistics for three years are given below in Straits Settlements dollars.

	1908	1909	1910
Imports	51,343,592	46,194,598	53,255,151 *
Exports	66,421,978	76,273,438	102,861,990 †
Revenue	24,623,325	25,246,864	26,553,018 a
Expenditure	25,874,573	23,633,852	23,598,610 b

* Live animals, foods, drinks, and narcotics, 32,067,919 dollars; raw materials, 3,894,431; manufactured articles, 13,954,537; bullion and specie, 3,160,275.

† Tin and tin ore, 57,154,891 dollars; rubber, 38,441,610; copra, 1,194,226; sugar, 679,794; rice, 655,085; gold bullion, 649,651.

a Customs, 10,851,374 dollars; railways, 5,996,649; posts and telegraphs, 835,204; forest revenue, 500,896; licenses, etc., 3,204,848; land revenue, 1,636,152; municipal, 1,074,742.

b Personal emoluments, 5,357,965 dollars; other charges (establishment), 4,026,341; railways, 7,514,810; public works, 5,527,900.

Vessels entered (1910), exclusive of native craft, 4509, of 1,752,551 tons.

COMMUNICATIONS. Total railways open for traffic at end of 1910, 538 miles. Length of telegraph and telephone lines (end of 1910), 1556 miles; wires, 5135; post offices, 63.

GOVERNMENT. Over local affairs, the chiefs preside. In the federal council, which deals with affairs common to the states, each state is represented; the rubber and tin interests have special representation. Sir Arthur H. Young, governor of the Straits Settlements, is high commissioner. Resident-general (1911), R. G. Watson (acting). Chief secretary to the government, E. L. Brockman, Tregganu (q. v.), is reported as not having joined the federation.

FENCING. The eighteenth annual intercollegiate tournament was won by Cornell. The United States Military Academy finished second and the United States Naval Academy third. The individual championship went to D. G. Ross of Cornell, who after a tie defeated M. W. Lorimer of the United States Naval Academy in the deciding bout. In dual matches Cornell defeated Pennsylvania, Columbia, and the Naval Academy. The Military Academy defeated Pennsylvania, Yale, and Columbia. Harvard defeated Springfield Training School, Yale, Princeton, and the Military Academy. Pennsylvania defeated Columbia and Princeton. The Naval Academy defeated Yale, Pennsylvania, and Princeton.

In the national championships held by the Amateur Fencers' League, the foils and duelling swords were won by G. H. Breed of the Fencers' Club of New York, and the sabres by A. G. Anderson of the New York A. C. The New York A. C. won the duelling swords contest for the Saltus Cup, Joseph T. Shaw of the Fencers' Club of New York was the victor in the competition

with foils, sabres, and duelling swords for the Hammond medals. The Fencers' Club of New York won the Saltus medals in the junior team foils contest.

FENN, HARRY. An American artist, died April, 1911. He was born in Richmond, England, in 1838, and came to the United States in 1857. He was well known as a painter of water colors, but his most widely known work was as an illustrator, notably of the books, *Picturesque Europe*, *Picturesque America*, *Picturesque Palestine*, and *Sinai and Egypt*. He illustrated Whittier's *Snow Bound* and *Ballads of New England*, which were among the first illustrated gift books published in the United States. He was the founder of the American Water Color Society.

FERGUSON, HENRY A. American landscape painter, died March 22, 1911. He was born in Glens Falls, N. Y., and was graduated at Trinity College. Upon the completion of his college course he traveled extensively and, although he had had no formal training, painted pictures in Egypt, Italy, Mexico, and South America, as well as in the United States. He was an associate of the National Academy of Design. He devoted a considerable portion of his time to the restoration of paintings, a work in which he achieved considerable success. In addition to his landscapes, he did many architectural paintings.

FERRIS, JOHN MASON. An American Dutch Reformed clergyman, died January 30, 1911. He was born in Albany, N. Y., in 1825, and graduated from New York University in 1843. After studying theology at the New Brunswick Theological Seminary, he was ordained to the ministry in 1849. He had charge of a church in Tarrytown, N. Y., from 1851 to 1854, in Chicago from 1854 to 1862 and in Grand Rapids, Mich., from 1862 to 1865. In 1864-5 he was a professor in the Wesleyan Theological Seminary. From 1865 to 1883 he was corresponding secretary of the Board of Foreign Missions of the Dutch Reformed Church. From 1881 until 1906 he was editor of the *Christian Intelligencer*. He resigned from this position on account of ill health.

FERRITUNGSTITE. See MINERALOGY.

FERTILIZERS. The year 1911 was marked by great growth in the fertilizer industry, activity in the search for and exploitation of new sources of fertilizing materials, and progress in the economical and efficient use of fertilizers.

GROWTH OF THE FERTILIZER INDUSTRY. The rapid growth of the fertilizer industry is strikingly brought out in census figures published during the year, which show that there were 550 establishments devoted exclusively to the manufacture of fertilizers in 1909, as compared with 400 in 1904; that the capital invested was \$121,537,000 in 1909 and \$69,023,000 in 1904, an increase of 76 per cent.; and that the value of products was \$103,960,000 in 1909, as against \$56,633,000 in 1904, an increase of 84 per cent. The output of the 550 establishments was 5,240,164 tons in 1909, to which should be added 229,845 tons of complete fertilizers, 48,020 tons of ammoniated fertilizers, 10,955 tons of concentrated phosphates, 22,615 tons of superphosphates, and 64,736 tons of other fertilizers produced by 292 establishments primarily engaged in the manufacture of other products, making the total production for the year 5,616,335 tons. The fertilizer output for 1904 was 3,267,777

tons. In 1909 as in 1904, the larger part of the output consisted of complete fertilizers, of which 2,947,642 tons were produced in 1909 and 1,329,149 tons in 1904. Of superphosphates 1,223,969 tons were produced in 1909 and 766,338 tons in 1904.

There is evidence that the growth indicated by these figures was maintained in 1910 and 1911. It is estimated that \$120,000,000 are now annually paid for commercial fertilizers in the United States, of which more than 80 per cent. is spent in the South Atlantic States and about 3 per cent. west of the Mississippi River. There has been a rapid increase in the use of fertilizers in recent years, not only in the South, but in the citrus-growing regions of California. This rapid growth of the fertilizer industry has been accompanied by unusual activity during 1911 in developing new sources of fertilizing materials.

POTASH. In the case of potash this activity has doubtless been accentuated in the United States by the controversy between American purchasers and the German potash syndicate regarding the supply and price of potash. This controversy, however, appears to have been satisfactorily adjusted toward the close of the year, the reported agreement being that the independent mines with which the American low-price contracts were made are to be absorbed by the syndicate and the American purchasers are to be supplied with potash for five years on the basis of \$32.50 per ton of muriate of potash instead of twenty dollars per ton as agreed upon by the independent mines. This price is materially lower than the current syndicate prices following the passage of the German law of May, 1910. The fact that Germany, through its vast natural deposits, now maintains a strict monopoly of the potash industry, and is thus able to control the supply and fix prices, has stimulated efforts in various countries to develop other sources of supply. Natural deposits of potash salts in Austria, particularly in Galicia, are being actively exploited; borings are being made with some promise of commercial success in Holland; and search for natural deposits is being made in other parts of the world. Explorations and investigations with a view to developing a domestic supply of potash have been especially active in the United States. The United States Geological Survey and Bureau of Soils are co-operating in systematic work of this kind. Possible sources of supply which are being investigated include the rock salts and bitterns of the eastern United States; surface and underground salt deposits of the arid regions; various potash-bearing minerals, such as feldspars, glauconite, leucite, and alunite, and seaweed. Although no deposits of potash salts of commercial importance have yet been discovered, information has been obtained which seems to warrant further investigation. Deep borings with this object in view have been undertaken near Fallon, Nev., in the bed of former Lake Bonneville, where earlier geological exploration had indicated the possible occurrence of underground salt deposits. During the past year the United States Bureau of Soils surveyed about 100 sq. miles of kelp-bearing area on the Pacific coast, which, it is estimated, will supply annually without detriment to the growth enough kelp to yield one million tons of potassium chlorid, or about three times the

present importation from Germany. The kelp contains a high percentage of potash salts which are easily extracted.

The progress that has recently been made in perfecting methods of extracting potash from potash-bearing minerals encourages the hope that with cheap power some of these may be made commercially successful.

On the whole there seem to be good grounds for the optimistic opinion of Secretary Wilson that "the day is not far distant when we shall cease to import potash."

PHOSPHATES. Further explorations and examinations during 1911 of the phosphate fields of Wyoming, Utah, Idaho, and Montana, have revealed what appear to be the most extensive deposits in the world. It is estimated that the deposits examined up to the present time are capable of yielding over 2,500,000,000 long tons of seventy per cent. phosphate, with the probability that the area will be greatly extended by further exploration. Only their comparative inaccessibility and the consequent high cost of transportation stand in the way of the present development of these deposits. It would seem that the supply of phosphates is sufficient to meet future demands for an indefinite period.

NITROGEN. As regards the third essential constituent of fertilizers, namely, nitrogen, the most notable development during the year was a marked increase in the production and consumption of ammonium sulphate, especially in the United States. The estimated output of ammonium sulphate in the United States in 1910 was 116,000 long tons as against 106,500 tons in 1909. The consumption in the United States in 1910 is estimated at 187,000 tons, representing an increase of 55 per cent. in imports. Germany produced 375,000 tons of ammonium sulphate in 1910, the United Kingdom 369,000 tons. The increase in the United States was due mainly to the construction of a large number of by-products coke ovens, from which three-fourths of the American product was obtained. The putting of ammonium sulphate on the free list in the new tariff act was followed by a large increase in American imports. Over half of the ammonium sulphate consumed in the United States is used for agricultural purposes in the Southern States.

The total annual world's output of ammonium sulphate, namely, about 1,100,000 long tons, is still less than one-half that of nitrate of soda, which therefore remains the principal source of nitrogen in fertilizers. The Chilean Nitrate Propaganda reports that the production of nitrate during the year ended June 30, 1911, was 2,758,000 short tons as compared with 2,685,000 tons during the preceding year. The world's consumption of Chilean nitrate during the year ended June 30, 1911, is stated to have been 2,670,000 short tons, of which the United States used 644,000 tons. The Chilean government is reported to have under consideration the sale of a portion of the nitrate lands. This would probably result in increased output and lower prices. The search for other nitrate deposits than those of Chile was continued during 1911, especially in the United States. A number of such deposits were found, but none of these has yet proved of commercial importance. Considerable progress was made during the year in the electro-chemical preparation of nitrogen compounds from the free nitrogen of the air,

but the products of this industry are not yet a serious rival of Chilean nitrate.

The utilization of organic sources of nitrogen, such as cotton-seed meal, packing-house by-products, fish residues, and the like, has rapidly grown, and the nitrogen in them commands a higher price per pound than in the more readily available nitrate of soda. There appears to be further opportunity for profitable utilization of such by-products. A recent report of the United States Department of Commerce and Labor calls attention to such an opportunity in the saving of the enormous wastes of fish residues at salmon canning factories.

HIGH-GRADE OR LOW-GRADE FERTILIZERS. The importance of using only high-grade materials was especially emphasized by several of the agricultural experiment stations during the year. It is safe to say that the experiment stations have done no more important thing than to demonstrate clearly and to insist that it does not pay the farmer to buy and use low-grade fertilizers.

LITERATURE. Among the more important literature relating to fertilizers appearing during 1911 was a book entitled *Manufacture of Chemical Manures*, by J. Fritsch, and a preliminary report on fertilizer resources of the United States, issued as *Senate Document 190*, Sixty-second Congress, Second Session.

FIJI ISLANDS. A British crown colony, composed of islands in the south Pacific. Total area (including 225 small islands), 7435 sq. miles. Largest islands; Viti Levu, 4112 sq. miles; Vanua Levu, 2432. Total population (1910), 137,588. Capital, Suva (1121 inhabitants), on Viti Levu. There are government and mission schools. Area (1900) under sugarcane, 51,870 acres; coconuts, 29,759; rice, 7291; bananas, 3912; corn, 1786; tea, 202. Livestock: 36,400 cattle, 5000 horses, 3000 sheep, 19,400 goats. Trade and finance are given as follows for four years:

	Imps.	Exps.	Rev.	Expend.
1907	£643,007	£ 881,364	£179,802	£156,811
1908	662,654	878,394	178,015	197,798
1909	636,250	947,136	177,909	187,684
1910	628,000	1,006,000	212,000	237,000

Tonnage entered and cleared (1910), 516,000. Public debt (1910), £104,000. Governor of Fiji and high commissioner for the western Pacific (1911), Sir Francis Henry May.

FILTRATION OF WATER. See **WATER PURIFICATION.**

FINANCIAL REVIEW. In addition to the topics discussed here the **YEAR BOOK** includes articles on **BANKS AND BANKING, NATIONAL BANKS, STATE BANKS, LOAN AND TRUST COMPANIES, SAVINGS BANKS, POSTAL SAVINGS BANKS, NATIONAL MONETARY COMMISSION, PRICES, TARIFF, TRUSTS, MONEY, INSURANCE, STANDARD OIL COMPANY, AMERICAN TOBACCO COMPANY, and UNITED STATES STEEL CORPORATION**, all of these articles contain material bearing upon various phases of the financial and industrial conditions of the year.

GENERAL BUSINESS CONDITIONS. The year 1911 was not distinguished by either business reaction or business prosperity. It was a year of notable irregularity in trade and industry; and yet, in spite of evident caution, a fair volume of business was transacted, though the amount of profits was generally a cause of disappointment.

Following the panic of 1907 there had been a very remarkable revival of industry beginning about the middle of 1908. This upward movement continued until the close of 1909 or even until the early part of 1910. The year 1910, however, was distinctly a year of reaction and retrenchment. The year 1911, therefore, opened with business men already in an uncertain frame of mind. This mental state was perpetuated by various events, especially by the trust prosecutions and proposals for tariff revision, with the result that at no time during the year was there a clear optimistic tone. Even at the very close of the year prominent business men were still undecided as to whether conditions would improve more or less rapidly, or whether they would remain about the same, or even decline. Yet the first three-quarters of the year may be distinguished from the last by greater political disturbance, a wet, cold spring and a hot, dry summer, crop scares, short-time business dealings, and hand-to-mouth buying. During the later months buying was more generous both because of exhaustion of supplies on hand and because of a more cheerful business tone. The majority opinion seemed to be that business readjustment had touched bottom and that a gradual improvement would follow. Money was fairly abundant during the entire year and American interest rates averaged low. Indeed, one of the noteworthy features of the year was the ability of America to finance her own crop movements and other business operations and even to make loans in Paris and Berlin.

The war scare over the Moroccan dispute was the cause of considerable financial disturbance in Europe and numerous labor controversies caused unusual business anxiety in Great Britain during the summer. In the United States labor disturbances were very distinctly less numerous and less threatening than in 1910; while wage changes were not considerable, there were numerous reductions in hours. The determined attitude of the government in the enforcement of the Sherman Anti-Trust law acted as a decisive check to business promotions. Indeed, this was a cause of great agitation in both financial and industrial circles. Moreover, in spite of the decisions of the Supreme Court in the Standard Oil (q. v.) and American Tobacco Company (q. v.) cases, the business world was very much in doubt as to the scope of the anti-trust law. A fictitious announcement that the steel trust was to be attacked by the government, that it would seek reorganization under government direction, that the attorney-general contemplated more than 100 suits against combinations, brought on a temporary stock market panic in September. This was quieted by statements made by Judge E. H. Gary and Mr. J. P. Morgan. By the close of the year discussion of the trust problem had cleared the atmosphere considerably, and business was less terrified by the proximity of increased governmental regulation. Moreover, the lowering of steel prices as the result of competition between

independents and the trust, together with the exhaustion of supplies in the hands of users, stimulated the placing of orders for iron and steel. Thus the unfilled orders on the books of the steel trust amounted to 5,084,761 tons on December 31; this was the greatest amount of such orders in several years, contrasting sharply with 3,611,317 tons in September, 1911, and 2,674,757 tons in December, 1910. Similarly in some other lines buyers, finding accumulated stocks exhausted, were forced into the market, with the result that at the very close of the year there were some indications of industrial betterment.

Speculation was cautious most of the year; nevertheless a good volume of new securities was floated, the markets for bonds and short-time bills were active, and stock prices generally were better January 1, 1912, than one year earlier. Bond sales on the New York Exchange were 40 per cent. greater and stock sales 22.8 per cent. less than in 1910. The records of the year disclosed few new maximum figures in production, partly because the prices of commodities and staples were very high. Thus the railway mileage construction was only 1815 miles, the lowest in any year since 1897. The number of freight cars built was only 55,031, or less than one-third the number built in 1910. Moreover, this was the smallest number built in many years and very much below the estimated number of 250,000 freight cars needed every year to maintain the existing rolling stock.

The cotton crop alone is notable for exceeding all previous crops, the estimates of the Department of Agriculture being 14,885,000 bales for 1911-12. This great crop was especially welcomed by manufacturers, since it followed two years in which the crops had been below normal and prices very high. Thus the 1910-11 crop was disposed of at the enormous value of \$820,320,000, an amount exceeding the value of the 1909-10 crop by \$132,000,000. The effect of the large 1911-12 crop was to reduce the price of cotton from 16c. at the beginning of the year to 9½c. at its close. As a result cotton planters took steps to reduce their acreage by one-fourth. The corn crop was the lowest since 1904, although the acreage was the largest ever, except in 1909-10; owing to high prices the value, which was \$1,565,000,000, was exceeded only in 1908-9. The price of corn was the highest in forty-five years, except in 1883. The wheat acreage was the largest in ten years, but the yield and the value had often been surpassed. The total value was \$542,663,000. The oats acreage was the greatest ever and the value, \$414,663,000, was also a new maximum; this value was due, however, to high prices, for the yield had been exceeded five times in the last nine years.

Building was quiet but normal, though high prices made large total expenditures. Foreign trade, especially exports, established some new high marks. There was a large exportation of cereals and meats, iron, and steel, and cotton during the early months. Imports were slightly less than in 1910. Business failures, while in greater number, were of smaller total liabilities than in 1910.

The better tone at the close of the year was accompanied by conservatism. This was in part owing to the imminence of an exciting presidential campaign. This involved also probable changes in the tariff and the trust law. High

prices were also looked upon as a continuing check upon trade.

BANK CLEARINGS. That the year 1911 was one of irregularity in business but with a total volume of business not much below normal is shown by the returns of bank clearings for principal cities. According to *Bradstreet's* the total clearings for 112 cities of the United States were \$157,916,332,000. This was a decrease of only 2.5 per cent. from the total of 1910 and of 4.5 per cent. from that of 1909. The total exceeded that of 1908 by 19 per cent., and that of 1907 by 9 per cent., but was about 1 per cent. less than that of 1906. As compared with the preceding year losses in bank clearings were confined to the first four months of the year; the clearings of the later months being generally greater than those of 1910. The losses, moreover, were confined to thirty-six of the cities, all the remainder showing an increase over the clearings of the preceding year. The following figures giving the clearings in millions of dollars by months reflect the general course of trade during the year: January, 14,292; February, 12,082; March, 13,277; April, 12,217; May, 13,331; June, 13,650; July, 12,899; August, 12,466; September, 12,372; October, 13,303; November, 13,858; December, 13,995.

Of the total clearings 60.5 per cent. were credited to New York City. This was the smallest percentage credited to that city since 1897. As compared with 1910 the New York clearings were 5 per cent. less, although they were 14 per cent. greater than in 1908 and 5.7 per cent. greater than 1909. Contrasting New York with the rest of the country shows that there was a gain outside New York of 1 per cent. over 1910 and 3 per cent. over 1909. The relatively lower position of New York was explained primarily by the small amount of stock-market operations, which in turn was due to the conservative tone of the year.

STOCKS AND BONDS. The uncertainty prevailing in the business world was reflected by the very irregular movements of prices on the stock exchanges. In general prices tended to advance during the first half of the year, but about mid-summer a general and decided slump began and this continued with added momentum until October. During November and December there was a very decided and general recovery. The slump during the summer was due very largely to the unfavorable crop reports, to the European war scare, and extensive labor disturbances abroad. This downward movement was greatly aggravated by newspaper reports that the attorney-general contemplated wholesale prosecutions against all sorts of trade combinations and agreements. It was particularly reported that suit was contemplated against the United States Steel Corporation. This was accompanied by a statement that the Steel Corporation would seek to readjust its organization to suit the demands of the Department of Justice. A denial of these rumors was made by Mr. J. P. Morgan and Judge E. H. Gary, restoring confidence. (See TRUSTS AND UNITED STATES STEEL CORPORATION.) The irregular movement is shown by the fact that there was a difference of more than thirty-nine points between the high and low prices of Union Pacific and more than thirty-two points between the high and low prices of United States Steel common. Similarly, the recovery in the later

months is shown by the fact that Union Pacific recovered eighteen points and United States Steel seventeen. Less extensive variations affected all other stocks. As a whole prices of stocks were slightly higher at the close of the year than at the beginning. According to the *Journal of Commerce and Commercial Bulletin* the total amount of new securities issued in 1911 was \$1,739,000,000, as follows: Railway issues—bonds, \$670,814,000; notes, \$326,948,000; stocks, \$101,442,000; industrial corporations—bonds, \$322,094,000; notes, \$67,590,000; stocks, \$250,597,000. The total exceeded that of 1910 by \$220,000,000, due to greater issues of railway bonds and notes, though some principal stocks showed net declines of a few points. The total transactions for the twelve months amounted to 126,515,547 shares of stock, a decrease of 22.8 per cent. as compared with 1910 and the smallest volume of transactions since 1898. On the other hand, the sales of bonds in 1911 amounted to \$889,080,000 par value, an increase of 40 per cent. over 1910, but 32 per cent. less than the record transactions of 1909.

BUILDING. According to reports to *Bradstreet's* the aggregate building expenditures in 120 cities during the year was \$824,088,000, a decrease of 2.6 per cent. from 1910 and of 7.3 per cent. from 1909. Of the aggregate building New York City was credited with 22 per cent. in 1911 as compared with 24 per cent. in 1910 and 30 per cent. in 1909. Chicago was credited with 12 per cent. or a total of \$105,269,000, this being a gain of 8 per cent. over 1910 and of 15 per cent. over 1909. Philadelphia ranked third, Los Angeles fourth, San Francisco fifth, and Boston sixth in building expenditures. Then followed in order Portland (Ore.), Detroit, St. Louis, Cleveland, Washington, Minneapolis, Kansas City, Milwaukee, Pittsburgh, Cincinnati, Newark, and Buffalo.

FAILURES. (a) *Commercial.* Failures were more numerous in 1911 than in any year since 1897, except 1908. In fact only six of the past thirty years show a greater number of failures, while only seven of the thirty show larger liabilities. The number of failures was 9.5 per cent. greater than in 1910, 7 per cent. greater than in 1909, and 23 per cent. greater than in 1907; it was, however, 9.7 per cent. less than in 1908. The total number of failures as reported to *Bradstreet's* was 12,679, with total liabilities of \$187,642,000. The liabilities were slightly less than in 1910, 36 per cent. less than in 1908, and 51 per cent. less than in 1907, but 33 per cent. greater than in 1909 and 47 per cent. greater than in 1906. The ratio of assets to liabilities in 1911 was 35.7 per cent. This was slightly more than in either of the two preceding years, but less than in 1908 or 1907; in this respect 1911 seemed to be a year of business strain. This is indicated also by the fact that the percentage of those in business failures was .77 per cent., a proportion exceeding that of any year since 1902, except 1908. The greatest number of failures and the greatest liabilities were in January and December, as is usual. August was the only month showing fewer failures than the corresponding month of 1910; and February, April, July, and December were the only months showing smaller liabilities than the same months of 1910. Failures were much more numerous in the Northwestern States than in 1910 and they were greater also in the Northeastern and the far Western than in any

of the preceding six years. The failures were, however, not localized by sections as is shown by the fact that in Massachusetts there were 15 per cent. fewer failures than in 1910, while in Connecticut there were 39 per cent. more. In New York City failures numbered 1569, with liabilities of \$30,634,000, an increase of 15 per cent. in number, but a decrease of 26 per cent. in liabilities, as compared with 1910.

(b) *Financial.* During 1911 there were 61 suspensions of banks and trust companies, as compared with 44 in 1910, 40 in 1909, and 132 in 1908. Of these, two were national banks, 33 State banks, 1 savings bank, 20 private banks, and 5 loan and trust companies. The total liabilities were \$26,192,000, a decrease of 17 per cent. from the 1910 figure and only one-third as much in 1908 and one-eighth as much as in 1907, but more than twice the amount in 1909. The failures of national banks were the fewest in more than twenty years, except 1902; the failures of State banks were more numerous than in any year since 1896, except 1908, when there were thirty-five such failures. The trust company suspensions were about the average number for the past ten years, but liabilities (\$12,373,000) were considerably above the average. This was due mainly to the failure of the Carnegie Trust Company early in the year, which accounted for about one-third of these liabilities. The total assets were \$20,459,000, of which slightly more than one-half were credited to the loan and trust company.

FOREIGN TRADE. That the total volume of business was large, in spite of the widespread feeling to the contrary, is shown by the fact that the total volume of imports and exports was the greatest in American history. The grand total, in which the returns for December are partially estimated, was \$3,625,305,000, an amount exceeding the total of 1910 by 9.8 per cent., and that of 1907, the previous maximum, by 9.4 per cent. The total imports were \$1,532,931,000, or 1.8 per cent. less than in 1910, but 3.8 per cent. larger than in 1909, and the second largest imports on record. The total exports were \$2,092,373,000, or 12 per cent. more than in 1910 and 8 per cent. more than the maximum record of 1907. Of the imports slightly more than one-half were free of duty. The export trade for December was the greatest for any single month, except December, 1910, which exceeded December, 1911, by 1.8 per cent. The excess of exports over imports was \$550,441,000, a sum exceeded only in 1908. The principal items of exports, and in parenthesis of the percentage of change from 1910, were as follows: Breadstuffs, \$122,836,878 (inc. 28.3); meats and dairy products, \$136,630,390 (inc. 26.6); animals, \$14,289,509 (inc. 57.7); cotton, \$515,930,120 (dec. 2.6); mineral oils, \$98,936,795 (inc. 11.7). Although the value of the cotton exports decreased slightly the quantity shipped increased 22 per cent. over 1910, showing the effect of a sharp decline in price.

STATISTICS. The following statistical items show at a glance some of the more important results of the year, with the percentage of change from 1910:

		Per cent.
Corn, bushels.....	2,531,488,000	12.3 dec
Corn, value.....	\$ 1,521,105,000	13.0 inc
Wheat, bushels.....	621,338,000	2.2 dec
Wheat, value.....	\$ 543,063,000	3.2 dec
Oats, bushels.....	922,298,000	21.8 dec
Oats, value.....	\$ 414,663,000	2.0 inc

Barley, bushels.....	160,240,000	7.8 dec
Barley, value.....	\$ 139,182,000	38.5 inc
Rye, bushels.....	33,119,000	5.3 dec
Rye, value.....	\$ 27,557,000	10.4 inc
Buckwheat, bushels....	17,549,000	.2 dec
Buckwheat, value.....	\$ 12,735,000	9.4 inc
Total cereals, bushels..	4,236,032,000	13.0 dec
Total cereals, value....	\$ 2,702,458,000	8.5 inc
Flaxseed, bushels.....	19,370,000	52.3 inc
Flaxseed, value.....	\$ 35,272,000	19.0 inc
Potatoes, bushels.....	232,737,000	14.3 dec
Potatoes, value.....	\$ 235,778,000	20.1 inc
Hay, tons.....	47,444,000	22.1 dec
Hay, value.....	\$ 694,570,000	7.1 dec
Tobacco, pounds.....	905,109,000	17.8 dec
Tobacco, value.....	\$ 85,210,000	16.7 dec
Rice, bushels.....	22,934,000	6.5 dec
Rice, value.....	\$ 18,274,000	9.9 inc
Cotton, bales, est.....	15,500,000	29.1 inc
Cotton, value.....	\$ 775,000,000	14.0 dec
Total value farm prod..	\$ 8,417,000,000	8.1 dec
Bank clearings, est....	\$157,600,000,000	2.7 dec
Imports, mdse., est....	1,530,000,000	2.0 dec
Exports, mdse., est....	2,067,000,000	11.0 inc
Total trade, est.....	\$ 3,597,000,000	5.0 inc
Building expenditure....	825,000,000	2.0 dec
New York stock sales....	127,000,000	22.2 dec
New York bond sales....	889,000,000	40.0 inc
Business failures.....	12,633	9.1 inc
Failure liabilities.....	182,000,000	1.0 dec
Pig-iron, tons.....	24,000,000	12.0 dec
Labor strikers.....	255,000	53.0 dec

CANADA. Industrial and commercial conditions in Canada were fairly prosperous during 1911. The northwest provinces especially enjoyed an unusual volume of business. The coal-mining industry in both the West and East had a large output; many new manufacturing plants were opened in various parts of the Dominion; immigrants added 350,000 to the population, an increase of 5 per cent. over the immigration of 1910. The value of cereal products was estimated at \$235,000,000, the value of the wheat crop being the greatest on record. Export of flour was the greatest for several years; cheese exports were somewhat less than in 1910, but prices were better. The apple crop was unusually heavy, exports being 70 per cent. greater than in 1910. The fisheries along the Atlantic coast had the largest catch and obtained the highest prices in their history. Owing to changes in the United States tariff the lumber industry in Ontario and Quebec was fairly prosperous, but in British Columbia the competition of lumber from Washington was severely felt.

The bank clearings of fourteen principal cities was \$7,194,598,000, an increase of 17.8 per cent. over 1910 and by far the largest in the history of the country. Only Halifax and St. John, N. B., showed decreases. Of the total, 32.9 per cent. was credited to Montreal; 25.7 per cent. to Toronto; 16.2 per cent. to Winnipeg; and 7.5 per cent. to Vancouver, B. C. The clearings of the last quarter were greatly in excess of those of any other quarter in Canadian history, a maximum of \$771,772,000 being reached in November.

Canada reported 1399 failures in 1911, a decrease of 4.1 per cent from 1910. The liabilities were only \$12,799,000, or more than one-fifth less than in 1910.

EUROPE. The most important features of the financial and industrial situation in Europe during 1911 were the Moroccan affair; the bad spring and very dry summer, resulting in greatly diminished crops and extraordinary prices of agricultural products; labor disturbances in international shipping, particularly in

England; and the abundance of money in the United States enabling American bankers to finance American crop movements without making demands upon Europe, and indeed to loan considerable sums in the European money markets, especially in Germany.

In ENGLAND the year opened with many prospects of being at least normally prosperous. Money was not abundant at the opening of the year, but became plentiful, the stock exchange was active, and industry generally was in normal condition. The Bank of England rate had been 4.5 per cent. at the beginning of the year, but was reduced to 4 per cent. in February, 3 per cent. in March, and 2.5 per cent. about the end of August. Thereafter the rate was raised to 3 per cent. on September 7, and a week later to 4 per cent., where it remained. Extensive and threatening labor disturbances marked the summer months. (See STRIKES AND LOCKOUTS.) The appearance of the war scare in June caused great apprehension generally, the stock market became inactive and money became scarce. Not only in England did the money rate advance, but the state banks of France, Germany, Austria, Belgium, Sweden, and Denmark raised their rates in September. One of the features of the year was the decline in the price of consols to 76.3, the lowest point in their history. This was explained by some as due to the financial policies of Mr. Lloyd-George, involving increased taxation. Others said it was due to the admission of certain colonial bonds as trustee securities. The majority opinion, however, explained the decline as due to natural causes, such as the increased cost of living and the widespread demand for money, making possible safe investments at relatively high rates of interest. There was only one shipment of gold to North America and that was in the spring. The gold exports to Egypt were small and the demands of India were met from Australia. South American shipments were not unusual. The unrest among the coal miners (see STRIKES AND LOCKOUTS and MINIMUM WAGE) caused a genuine scarcity of coal late in the year. The Admiralty make contracts for large shipments of coal in the United States. Shipbuilding was very prosperous, there being launched 1478 vessels of 2,080,000 aggregate tonnage, and 2,127,000 indicated horsepower. This was more than half of the world's total and greatly in excess of the output of 1910.

In GERMANY industrial and commercial conditions were generally satisfactory. There was little labor disturbance, but the Moroccan affair and the high prices of commodities caused considerable concern. The iron, coal, shipbuilding, shipping, and railway industries were more prosperous than in 1910. Pig iron production, for example, was 15,534,000 tons, an increase of 5 per cent. over 1910, and exceeding that of any preceding year. The output in December, moreover, exceeded that of any preceding month. In shipbuilding there were constructed 330 vessels of 401,881 tons, with 666,885 indicated horsepower. This was an increase of twenty in the number of vessels with nearly double the tonnage and horsepower as compared with 1910. Moreover, the increase in shipbuilding was far greater than in any other country except Great Britain. Railway receipts greatly increased, although this was partly due to the interference of the dry summer with water transportation. The Moroccan affair caused

money rates to advance, brought on some disturbance of the Berlin stock exchange, caused the withdrawal of an amount estimated at \$100,000,000 by French bankers, and the loaning in Germany of an amount variously estimated at from \$50,000,000 to \$125,000,000 by American bankers. This influx of American money was very notable, since German bankers have customarily made advances to America during the late summer and fall months.

In FRANCE the first half of the year was a period of unusual financial activity. During this period considerable amounts of Pacific 4 per cent. and St. Louis and San Francisco 5 per cent. bonds were sold to French investors, and at the same time the stock of various American companies, including Atchison, Topeka, and Santa Fe, the Philadelphia Company, the American Telephone and Telegraph Company, Utah Copper, United States Rubber first preferred, Virginia-Carolina Chemical, and American Smelters Securities Company preferred A, were listed on the Paris exchange. With the development of the controversy with Germany, however, money became very scarce. To meet demands the bank of France put out a greatly increased circulation, the total being 5,800,000,000 francs. French bankers also called in their credits in Germany, Russia, Austria, Belgium, and elsewhere to an amount probably exceeding \$250,000,000.

FINLAND. A grand duchy on the Gulf of Bothnia; a part of the Russian empire.

AREA AND POPULATION. Total land area, 125,784 sq. miles. Of the total area (144,255 sq. miles), 11.15 per cent. is under lakes. Population, January 1, 1910, 3,059,300. Births (1909), 95,005; deaths, 50,577; still-births, 2477; marriages, 19,418; emigrants, 19,144. Helsingfors, the capital, had (1910), 136,497 inhabitants; Åbo, 54,687; Tammerfors, 44,064; Viborg, 50,421.

EDUCATION. There were in 1909 about 1800 primary schools attended by approximately 88,000 pupils. Secondary education is provided in lyceums, realschulen, and country high schools, well attended by both sexes. There are special schools, besides the university at Helsingfors. The average standard of education is high. The Finns are Lutherans in creed.

PRODUCTION, COMMERCE, ETC. The yield from the area under cultivation in 1908 was 6,456,215 hectoliters of oats, 3,945,266 of rye, 1,808,250 of barley, 39,259 of wheat; potatoes, 5,706,877 hectoliters; flax and hemp, 123 tons. Crown forests (1909), 12,788,290 hectares; income, 9,281,782 marks; expenditure, 2,959,124 marks. Saw mills (1908), 591; employees, 23,945; production, 2,838,064 cubic meters of timber. Livestock: 28,409 horses, 1,149,349 cattle. Output (1908 of iron ore, 9393 metric tons; pig iron, 11,712; bar iron, 26,388. Manufactures of all kinds (1908), 9165; aggregate number of workers, 127,075; aggregate value of products (exclusive of flour-mills output), 480,588,667 marks.

Trade statistics for four years are shown below in thousands of marks (1 mark=19.3 cents):

	1907	1908	1909	1910
Imports	379,056	363,540	367,127	384,100
Exports	267,237	245,044	257,054	288,100

The principal articles of special trade in 1910 were as follows:

Imports	1000 mk.	Exports	1000 mk.
Cereals	81,800	Timber	155,800
Machinery	21,300	Paper, etc.	49,300
Minerals	17,200	Butter	29,400
Iron, etc.	17,200	Skins, etc.	10,300
Sugar	19,200	Fish	5,000
Coffee	17,800	Wooden goods....	5,600
Cotton	12,200	Cottons	4,200
Chem. prods.	12,100	Iron	1,700

Germany furnished imports and received exports valued at 159,700,000 and 34,400,000 marks respectively; Russia, 110,300,000 and 78,900,000; Great Britain, 45,700,000 and 85,400,000. Vessels entered (1910), 9313, of 2,611,820 tons; cleared, 9059, of 2,519,139. Merchant marine (January 1, 1911): 2851 sailing vessels, of 321,200 tons; 468 steamers, of 71,594 tons. Railways in operation (January, 1911), 3662 kilometers (largely state-owned). Post offices, 2045.

FINANCE. The unit of value is the mark, worth 19.3 cents. Finland has its own financial and customs system. Revenue and expenditure for three years are shown in the following table (in marks):

	1908	1909	1910
Revenue	160,507,038	185,053,833	152,744,059 a
Expenditure	167,993,796	177,650,169	156,046,606 b

a From revenue-yielding administrations, 62,-326,975 marks; customs, 50,770,316; licenses, 12,-832,724; posts, 6,981,848; direct taxes, 6,421,674; etc. Extraordinary, 686,277.

b Communications, 45,519,012 marks; worship and instruction, 17,427,081; civil administration, 13,037,355; military, 11,143,860; public debt, 8,-471,075; agriculture, etc., 7,042,484; commerce and industry, 6,314,130; etc. Extraordinary, 19,452,451.

The public debt stood, January 1, 1911, at 178,028,926 marks.

GOVERNMENT. The grand duke of Finland is the Czar of All the Russias, who summons and may dissolve the Diet—a unicameral body chosen by direct proportional election, both sexes being eligible to vote. This body has theoretically the power of interior legislation; but its power was radically diminished by the Imperial Legislation act of June 30, 1910. A governor-general (1911, Lieut.-Gen. F. A. Seyn) and the Russian secretary of state for Finland (1911, Lieut.-Gen. A. Langhoff)—responsible to the czar and, theoretically, to the Diet—are the heads of the executive.

HISTORY. The elections held in January, 1911, brought out a larger number of voters than in the previous year. The results showed the Social Democrats to be the dominant party, the others in their order of numerical strength being as follows: Old Finns, Young Finns, Swedes, Agrarians, and the Christian Labor party. Nineteen women were elected. On November 10, 1911, the Russian Duma passed by large majorities bills for increasing Finland's military contributions till they reached the sum of 20,000,000 marks annually, and for placing Russians on civil equality with Finns in the Grand Duchy.

FIRE INSURANCE. See **INSURANCE.**

FIRE PROTECTION. (See also the article **ARCHITECTURE.**) The committee on statistics and origin of fires of the National Board of Fire Underwriters during the year published the

results of an inquiry addressed to the chiefs of fire departments of a number of European cities in reference to fire losses in the year 1910. The information collected was along the same lines as used by the board of underwriters in gathering statistics and other information from cities in the United States, and the detailed reports were most valuable. As was generally appreciated by insurance interests and others informed, the contrast between the care, forethought, supervision, and sense of responsibility of the people of Europe in regard to losses by fire appeared in marked contrast with the lack of such qualities in the United States, which occasions an annual loss of hundreds of millions of dollars. The statistics of this report are summarized in the following table:

	Number of cities reporting loss	Population	Per capita loss
United States ..	297	29,996,723	\$2.39
England	11	2,335,847	.44
France	8	4,392,529	.92
Germany	13	5,616,822	.19
Ireland	2	657,680	.45
Norway	1	244,000	.25

AMERICAN FIRE LOSSES IN 1911. The losses by fire in the United States and Canada during the year 1911, as recorded by the *Journal of Commerce and Commercial Bulletin*, aggregated \$234,337,250, as compared with \$234,470,650 charged against 1910. The continued high loss record of the United States was beginning to attract more attention outside insurance circles, and during the year there was much more interest shown by the general public in measures looking to the reduction of the appalling fire waste. This was evidenced by many newspaper and magazine articles, and in several States by the enactment of salutary legislation.

The insurance losses in 1911 were somewhat heavier than in 1910, due to the greater proportion of insured property destroyed. The fire losses of 1910 included those occasioned by forest fires on property with little if any insurance, but in 1911 fires were much less numerous.

The fire losses in the United States and Canada during the thirty-five years ended with 1911 aggregated \$5,181,345,425, or an annual average of \$148,038,440. From the accompanying table giving the losses by years during the past thirty-five years, 1877-1911, it will be seen that there was a steady increase in the country's fire waste, and that, notwithstanding all the more recent factors for the reduction or prevention of fire losses, the losses continued abnormally heavy.

1911	\$ 234,337,250	1893	\$ 156,445,875
1910	234,470,650	1892	151,516,000
1909	203,649,200	1891	143,764,000
1908	238,562,250	1890	108,993,700
1907	215,671,250	1889	128,046,800
1906	459,710,000	1888	110,885,600
1905	175,193,800	1887	120,283,000
1904	252,554,050	1886	104,924,700
1903	156,195,700	1885	102,818,700
1902	149,260,850	1884	110,008,000
1901	164,347,450	1883	110,149,000
1900	163,362,250	1882	84,505,000
1899	136,773,200	1881	81,280,000
1898	119,650,500	1880	74,643,400
1897	110,319,650	1879	77,703,700
1896	115,655,500	1878	64,315,900
1895	129,835,700	1877	68,266,800
1894	128,246,400		

Total for 35 years.....\$5,181,345,425

A carefully compiled record, also made by the *Journal of Commerce*, summarizing the fires credited with causing a property loss of \$10,000 or over in each instance, shows that there were no less than 3410 such fires during 1911. This compares with 3225 fires in 1910 and 3270 in 1909.

FIRE PREVENTION. In 1911 considerable legislation, both State and local, was enacted to provide authority to enforce various means of fire prevention and the official inspection of fires. In Iowa a State Fire Marshal law (Chapter 128, Acts of 34th General Assembly) went into effect July 4, 1911, which conferred fire marshal powers on the chiefs of fire departments and clerks of townships, enabling them to make inspections and order changes or removals. The law also provided for instruction in the public schools on fire dangers, required fire drills at least once a month, and the maintenance of all doors and exits unlocked during school hours. In New York a State fire marshal law was approved June 26, 1911 (Chapter 451, Laws of 1911), making it the duty of the State fire marshal "to enforce all laws and ordinances of the State, and of the several counties, cities, and political sub-divisions thereof, except in cities having over 1,000,000 inhabitants, as follows: (1) The prevention of fires; (2) the storage, sale, or use of combustibles and explosives; (3) the installation and maintenance of automatic or other fire alarm systems and fire extinguishing equipment; (4) the inspection of steam boilers; (5) the construction, maintenance, and regulation of fire-escapes; (6) the means and adequacy of exit, in case of fire, from factories, asylums, hospitals, churches, schools, halls, theatres, amphitheatres, and all other places where numbers of persons work, live, or congregate from time to time for any purpose; (7) the suppression of arson and investigation of the cause, origin, and circumstances of fire."

In Ohio a State building code, adopted in 1911, requires the State fire marshal and the chiefs of all fire departments to enforce its provisions respecting fire protection. The code contains specifications as regards constructions and fire protective devices. In New York City a fire prevention bureau was established by an act (Hoey act), amending the Greater New York charter, which gives to the fire commissioner increased powers, especially with regard to fire alarms, fire extinguishing and fire-escape equipment of a building, and makes it possible for him to prohibit and prevent the occupancy or use of a building of public access thereto, until orders issued by the fire department have been complied with. The tendency throughout the various cities of the United States was to increase the power of local officials, and to demand that life and property, especially in the case of factories employing many operatives, be surrounded with greater safeguards, and it would seem as if there were increased recognition of the danger of present conditions.

HIGH PRESSURE SYSTEMS. During the year the Philadelphia high pressure system was extended by putting into service the Fairhill high pressure fire service station located at North 7th Street and Lehigh Avenue. It is provided with ten gas engines, driving triplex double-acting piston pumps of a capacity of 1250 gallons per minute each, and one small engine and pump

of 350 gallons per minute, making a total of 12,850 gallons per minute, or approximately 18,000,000 gallons per 24 hours at a pressure of 300 pounds to the square inch. Ordinary illuminating gas is used for the engines, while the pumps are fed from a basis of 5000-gallons capacity to which two independent supply systems are connected. The area protected by this station is bounded by Race Street on the south and Allegheny Avenue on the north, and approximately from the Delaware River to Broad Street. It is gridironed with a system of mains having nominal diameters of from 20 to 8 inches.

A new high pressure water system at Jacksonville, Fla., was completed and tested in March, 1911. It consists of an electrically operated pumping station located on the St. John's River and supplied with current from the municipal water and electric light and power plant. There are two 10-inch, 4-stage, centrifugal pumps, each directly connected to a 375-horsepower, 3-phase, 2200-volt motor. The capacity of each pump is 2500 gallons per minute against 175 pounds discharge pressure at the pump. The distribution system includes about $4\frac{1}{4}$ miles of mains, consisting of 838 feet of 20-inch, 3640 feet of 16-inch, 11,270 feet of 12-inch, and 6940 feet of 8-inch pipe. There are 90 hydrants in service, each with one 3-inch and two $2\frac{1}{2}$ -inch hose outlets, while valves are so arranged that in case of a break only a single line of pipe two blocks in length need be shut off. Jacksonville was visited by a severe fire in 1907, and the new system, so far as completed in 1911, provided protection for the mercantile and warehouse districts, with provision for later extensions.

In New York City the high pressure systems of Manhattan and Brooklyn were extended during the year, and further extensions were in progress, both systems having worked most successfully; and in Manhattan it was recommended that the entire city below Fifty-ninth Street should be thus protected. In Brooklyn the greater part of the mercantile section and water front was provided with the high pressure mains and hydrants.

MOTOR APPARATUS. During the year considerable progress was made with the motorization of the various fire departments both in Europe and in the United States. In Germany this was well under way, and the fire departments of several of the larger cities have been thoroughly reorganized on this basis with improved apparatus, which was showing great efficiency. In London and other English cities, as well as in Dublin, a beginning was being made, and it was universally recognized that in the very near future all fire apparatus must be motor driven.

In the United States, where conditions require the use of heavier pumping units than in Europe, the larger cities were hesitating about supplanting steam fire engines with gasoline motor engines until the same reliability and capacity in pumping could be secured. In New York, Bridgeport, and Birmingham steam fire engines, provided with automobile propelling engines, were in use, and in several fire departments various forms of tractors were supplied for engines, ladder trucks, and water towers. A notably efficient type of the latter on the couple-gear principle was added to the New York fire department, and proved so success-

ful as to lead to the ordering of two other tractors of the same type, to handle the heavy water towers. The New York department also received during the year a heavy gasoline motor pumping engine, which was placed in service for observation and test. It was represented as equivalent to a second-sized engine, and was the first gasoline pumping engine to meet the requirements of the New York fire department. Throughout the country various smaller pumping engines, combination cars, and other machinery were installed and proved very successful. The high speed of the combination pumping engines enabled them to reach a fire at an early stage and extinguish it before it had developed unduly. Accordingly, it was the universal opinion that for towns and small cities motor apparatus is both efficient and economical, and a census made during the year by the *Municipal Journal* showed that there were used in the departments of the United States between 400 and 500 pieces of motor apparatus. The cities reporting their fire department statistics to this particular inquiry showed an aggregate of 58 pumping engines, 15 plain hose wagons, 217 combination wagons, 24 chemical engines, 8 ladder trucks, and 92 automobiles for the use of chiefs. Other classes of apparatus figuring in the same statistics aggregated more than 8000 for 692 cities, so that the opportunity for motorization at the end of the year was most extensive.

FIRE PROTECTION. Fire in a waist factory in the "Triangle" building in New York in April, 1911, in which 147 operatives lost their lives, was responsible for calling attention to the poor condition of many buildings housing a large number of operatives. Some of these buildings structurally were termed "fire-proof," but they were utterly devoid of necessary fire protective devices and means of egress even under favorable conditions, not to mention panics into which ignorant workers could easily be thrown at an outbreak of fire. This particular fire was caused in all probability by a lighted cigarette or match being deposited in inflammable waste, and the spread of the flames through the workroom was practically instantaneous. The loss of life was occasioned both by the flames and by the operatives, cut off from stairways and fire-escapes, jumping from the windows. The disaster aroused particular attention, as the building was typical as regards general conditions of thousands in New York and other cities, and in many respects far superior; therefore it was felt that active means should be taken to prevent the repetition of such a calamity. Investigations that were held showed the divided responsibility of the various State and city departments charged with the inspection of factories and other buildings. The proprietors of the Triangle Waist Company, in whose lofts the fire occurred, were indicted and held for trial, but were acquitted. In addition to arousing public sentiment, the chief gain was the passage of a bill giving increased powers to the fire commissioner, discussed elsewhere.

The large fires during the year just closed included no less than thirty-six fires where there was a property damage of half a million dollars or over. These large fires are given below:

Location and description.	Estimated loss
Little Rock, Ark., business block.....	\$1,000,000
Minneapolis, Minn., electric power plant.....	720,000
Jefferson City, Mo., State House building.....	1,000,000
Point Richmond, Cal., sulphuric acid plant.....	500,000
Chicago, Ill., grain elevator.....	500,000
Donaldsonville, La., business section of town.....	750,000
White Plains, N. Y., hotel, apartment house and stores.....	500,000
Kokomo, Ind., automobile factory.....	750,000
Minneapolis, Minn., business block.....	1,178,000
Chicago, Ill., cold storage warehouse.....	1,100,000
Benton, Pa., whiskey storehouse.....	1,000,000
Fayette, Ala., court house and stores..	500,000
Eros, La., lumber plant.....	500,000
Albany, N. Y., State Capitol building....	5,500,000
Apple River Falls, Wis., electric power plant.....	500,000
Bangor, Me., conflagration.....	3,500,000
Coney Island, N. Y., amusement parks....	2,225,000
Dubuque, Iowa, lumber yards.....	500,000
St. Louis, Mo., sash and door works and other.....	700,000
Medford, Okla., business portion of town	500,000
Chicago, Ill., stables and stock yards....	500,000
Waters, Mich., lumber plants & timber..	1,125,000
Cochran, Ont., entire town.....	500,000
Porcupine District, Ont., mining property, lumber mills, etc.....	3,500,000
Brooklyn, N. Y., furniture store & other	550,000
Clayton, N. Y., summer hotel.....	500,000
Elmhurst, Wis., saw mill and general...	700,000
Nelson, B. C., smelter plant.....	750,000
London, Ont., business buildings.....	870,000
Ogden, Utah, business buildings.....	750,000
Owen Sound, Ont., grain elevator.....	1,000,000
Moosejaw, Sask., flour mills and other..	500,000
Shenandoah, Pa., colliery.....	700,000
Brooklyn, N. Y., printing and book plant and other.....	500,000
Washington Court House, Ohio, several business houses.....	1,250,000

FISH AND FISHERIES. The report of the United States commissioner of fisheries showed that for the fiscal year ending June 30, 1911, there were distributed by the Bureau of Fisheries 42 species of fish, with a total of 473,535,461 eggs, 2,559,327,615 fry, and 36,094,503 fingerlings, yearlings, and adults. In addition 162,505,000 young lobsters were distributed. The greatest numbers of fish were whitefish, blueback salmon, pike, perch, yellow perch, white perch, cod, and flatfish. Shipments of chinook, silver, blueback, and landlocked salmon, and of lake trout were made to Argentina, of black spotted trout to France, rainbow and brook trout to Japan, and carp to Mexico. The report of the commissioner as to the value of the United States fisheries was not available at the time of writing this summary.

The act of April 31, 1910, abrogated the leasing system for the seal fisheries on the Pribilof Islands, and the control of the sea fisheries was put directly under the charge of the commissioner of fisheries. A bulletin prepared by W. L. Lembky, assistant in charge, summarized the work accomplished in organization. This report showed that 12,922 skins were sold in London in November, 1910. Professor Heath, of Stanford University, who was appointed naturalist in charge of special investigations, published his results as a separate document of the Bureau of Fisheries. He reported no alarming decrease in the number of males, but thought the females were being killed off too rapidly, probably as a result of pelagic fishing. This pelagic fishing, chiefly by the Japanese, is a

serious hindrance to any increase in the size of the herd.

Whaling has been very active during the past two years, especially in southern waters, where the industry is reported to be of more importance than it was forty years ago in the north. From the island of South Georgia 106,800 barrels of oil were brought to market in 1910. Most of the whales captured are of the humpback variety.

FISHER, WALTER LOWRIE. An American lawyer and publicist, appointed March 7, 1911, secretary of the interior, to succeed Mr. Ballinger, who had resigned. He was born in Wheeling, Va. (now West Virginia), in 1862. He was a student at Marietta College, Ohio, and Hanover College, Indiana, from 1878 to 1883, graduating from the latter institution, of which his father was president, in 1883. He studied law and was admitted to the bar in 1888. He engaged in practice in Chicago, becoming a member of the firm of Matz, Fisher and Boyden. In a short time he became known not only as a lawyer of ability, but as a forceful leader in behalf of popular and efficient government. In 1901 he became secretary of the Municipal Voters' League of Chicago, a strong organization formed to bring about reforms in the city government. He was chosen president of the league in 1906. In this work he did notable service. He early became interested in the problem of conservation and when in 1909 the National Conservation Association was formed he, together with Mr. Gifford Pinchot, drew up its declaration of principles. He was chosen vice-president of the association. Experience in practical questions relating to his office was gained in the conduct of cases before the United States Commerce Commission. His ability was recognized by President Taft in 1910 by his appointment as a member of the committee to investigate railway securities. He acted as counsel for the Merriam Commission in investigating corruption in Chicago. He was employed by the Illinois Central Railway in conducting cases of graft on the part of several of its employees.

FISK UNIVERSITY. An institution for the higher education of negroes, at Nashville, Tenn., founded in 1866. The students enrolled in the various departments of the university for the year 1910-11 numbered 538. The faculty numbered 38. Mr. George E. Haynes was appointed head of the department of sociology, created in 1910 for the upper class students. Mr. Haynes is director for the New York committee on urban conditions among negroes. This department is doing strong work in the university in the city of Nashville and in connection with the New York committee. The university received several small benefactions during the year. The amount of the productive funds is \$52,515, and the income about \$62,000. The library contains about 90 0 volumes. The president is George A. Gates, D. D.

FITZGERALD, OSCAR PENN. An American bishop of the Methodist Episcopal Church, South, died August 5, 1911. He was born in North Carolina in 1829, and was educated in the public schools of that State. In 1853 he entered the ministry of the Methodist Episcopal Church, South. Two years later he removed to California and became editor of the *Pacific Methodist* and *Christian Spectator*. From 1867 to 1871 he was superintendent of public instruc-

tion in California. He became in 1878 editor of the *Nashville Christian Advocate*. He was elected bishop in 1890. He was the author of *California Sketches*; *Christian Growth*; *Glimpses of the Truth*; *Eminent Methodists*; *The Epworth Book*; *Judge Longstreet*; *Sunset Views* (1900); and *Upper Room Meditations* (1902).

FLAX. Data on the world's flax crop in 1911 are not available, but the normal annual production is estimated at a little more than 100,000,000 bushels of seed and from 1½ to 2 billion pounds of fibre. Russia is the leading fibre-growing country in seed production. Dry weather in Europe and North America reduced the crop to below normal in many regions. The crop in the United States was much better than the year before, but, being far below normal, was still insufficient to supply the demand. The production of flaxseed amounted to 19,370,000 bushels in 1911 as compared with 12,718,000 bushels in 1910. Based on the farm value on December 1, 1911, which was \$1.82 per bushel, the crop represented a value of \$35,272,000, which was exceeded only in 1909. The area in flax in 1911 was 2,757,000 acres, the highest since 1907. The average yield per acre was seven bushels as compared with 5.2 bushels the year before. The leading flaxseed producing States and their yields were as follows: North Dakota, 9,120,000 bushels; Montana, 3,272,000 bushels; South Dakota, 3,217,000 bushels, and Minnesota, 3,200,000 bushels. The highest average yield, twelve bushels per acre, was secured in Wisconsin.

The flax industry of Ireland and the causes which contributed to its decline were recently investigated by the Department of Agriculture and Technical Instruction. A survey of the industry showed that in 1910 the area under flax was 45,974 acres, and the value of the crop over \$2,500,000. The area cultivated reached its height in 1865—301,693 acres—since which time it steadily decreased until in 1900, when it was only 46,939 acres. The speculative character of the crop due to the uncertainty of prices and yield is believed to be the main cause of the decline.

FLEMING, WILLIAMINA PATON. An American astronomer, died May 21, 1911. She was born in Dundee, Scotland, in 1867, and educated in the country. She taught at Dundee from 1871 to 1876. In 1879 she became assistant at the Harvard College Observatory. In 1898 she was appointed curator of astronomical photographs. Her method of handling these photographs gained for her considerable reputation. In her charge was the Astrophotographic Building at Harvard College. She was known also as a discoverer of new stars, variables, etc. She discovered the spectrum of a meteor which appeared on a plate exposed at Arequipa on June 18, 1897. She found a second similar spectrum in 1902. She was an honorary member of the Royal Astronomical Society in London and an honorary associate in astronomy at Wellesley College.

FLIES. See INSECTS AND THE PROPAGATION OF DISEASE.

FLORIDA. POPULATION. The Thirteenth Census, taken in 1910, showed a population of 752,619 as compared with 528,542 in 1900, an increase of 42.4 per cent. in the decade. The principal cities in the State, with their populations in 1910 and 1900, are as follows (the figures in

parenthesis are for 1900): Jacksonville, 57,699 (23,429); Tampa, 37,782 (15,839); Pensacola, 22,982 (17,747); Key West, 19,945 (17,114); Miami, 5471 (1681); St. Augustine, 5494 (4272); Tallahassee, 5018 (2981). The figures show a remarkable gain in population in most of the cities of the State in the decade.

AGRICULTURE. The Thirteenth Census included statistics of agriculture in the State, bearing date of April 15, 1910. At that date the farms in the State numbered 50,016, compared with 40,814 in 1900. The land in farms was 5,253,538 acres, compared with 4,363,891 acres in 1900. The improved land in farms was 1,805,408, compared with 1,551,653 in 1900. The average acres per farm was 105, compared with 106.9 in 1900. The value of farm property in the State, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$143,183,183, compared with \$53,929,064 in 1900. The average value of all property per farm was \$2683, compared with \$1321 in 1900. The average value of all land per acre was \$17.84, compared with \$7.06 in 1900. Of the total number of farms in the State, 36,674 were operated by owners and managers and 13,342 by tenants; of the former, those free from mortgage numbered 29,614 and those under mortgage 5160. The native white farmers numbered 34,080; foreign-born white 1215, and negro and other non-white 14,721. Of the non-white farmers 16 were Japanese, 5 Chinese, and 2 Indians. All the rest were negroes. The domestic animals, poultry, and bees in the State in 1910 were valued at \$20,591,187, compared with \$11,106,016 in 1900. The cattle numbered 845,188, valued at \$9,262,262; horses and colts, 45,640, valued at \$4,854,699; mules, 23,333, valued at \$3,545,821; swine, 810,069, valued at \$1,848,731; sheep and lambs, 113,701, valued at \$256,166. The poultry of all kinds numbered 1,326,271, valued at \$673,814. The acreage, production, and value of the principal crops in 1910 and 1911 are shown in the following table:

	Acreage	Prod. bu.	Value
Corn1911	636,000	9,286,000	\$7,429,000
.....1910	630,000	8,190,000	6,962,000
Oats1911	43,000	580,000	435,000
.....1910	42,000	680,000	432,000
Rice1911	700	18,000	14,000
.....1910	900	19,000	14,000
Potatoes ..1911	10,000	900,000	1,805,000

.....1910	3,500	2,380,000	547,400
Cotton ...1911		c 73,000	

a Tons. b Pounds. c Bales.

MINERAL PRODUCTION. The State is not important as a producer of minerals. The chief product is phosphate, which was produced in 1910 to the value of \$8,647,774, compared with a value of \$8,541,301 for the product in 1909. Other minerals produced are clay products, sand-lime brick, lime, and fuller's earth. The total value of the minerals produced in 1910 was \$9,284,705, compared with a value of \$9,239,491 in 1909.

EDUCATION. The latest statistics available for educational matters in the State are for 1910. On that date the school population of the State was 148,089, of whom 92,834 were white and 86,187 colored. The total enrollment in the

schools of the State in the school year 1909-10 was 148,089, of whom 92,834 were white and 55,255 colored. A strong effort has been made in recent years to improve the condition of rural schools in the State. Instruction in agriculture has been introduced and this has received the cooperation of the University of Florida. The average salary of male white teachers in the State was \$68.13 monthly; female white teachers, \$55.80; for colored teachers, \$33.68 monthly, and female, \$30.18 monthly.

POLITICS AND GOVERNMENT. The State legislature met in 1911 and passed several important measures which are noted in the paragraph *Legislation*, below. The expiration of the term of Senator Taliaferro made it necessary for his successor to be chosen. This was the second primary election for senator to succeed Senator Taliaferro. A primary election was held on May 9, 1910, in which no candidate received a majority, and under the law of the State a second primary was necessary. This was held on June 7, 1910, and resulted in the defeat of Senator Taliaferro by N. P. Broward, former governor of the State. Mr. Broward died, however, before he could take his place in the Senate. On this account it was necessary to hold another primary election for Senator, and this took place on January 10, 1911. The candidates were W. A. Blount, John N. C. Stockton, and Nathan P. Bryan. Senator Taliaferro withdrew as candidate for reelection. This election, too, failed because no candidate received the necessary majority of votes, and another was held on January 31. This resulted in the election of Mr. Bryan. This election constituted the sixth primary contest for the election of United States senator within two years. On April 17, the income tax amendment to the constitution was ratified by the lower house. It failed of passage, however, in the Senate.

The long-continued efforts of the government to break up the system of so-called peonage in the South were substantially aided by the refusal of President Taft in January to commute the sentence of imprisonment given by the State Court to W. S. Harlan, manager of a large lumber company operating in Florida and Alabama. The case involved the use of force in preventing the desertion of foreign born laborers brought to Savannah from New York and from Savannah to the lumber camps of which Harlan was manager. He was convicted of violation of the peonage law and was sentenced to pay a fine of \$5000 and to be imprisoned for eighteen months. Mr. Harlan is a man of wealth and influence and efforts were made to have the prison sentence commuted. The President in refusing this, said, "The testimony was specific and detailed in cases of the attempted escape of such laborers (of foreigners being taken South from New York who do not speak our language nor understand what was being done to them) showing their pursuit, capture, and terrorism by display of revolvers, and in one or more instances of actual whipping." The President said further, "When a man of high business standing and large enterprises is convicted of the offense, the punishment ought to be such as to deter others from the practice. Fines are not effective against men of wealth. Imprisonment is necessary. I am well aware of the grievous character of confinement in jail to a man of Mr. Harlan's standing, and I should

be glad to yield to the appeals of his many friends, but I cannot do so. I believe him to be guilty of the charge of which he has been convicted. . . . To relieve such a one from the penalty of imprisonment when properly convicted and sentenced would be to break down the authority of the law with those of power and influence and would tempt on their part further breaches. What is worse, it would give real ground for the contention so often heard that it is only the poor criminal who is punished."

OTHER EVENTS. On January 22 a fire in the city of Jacksonville did damage to the amount of \$100,000.

LEGISLATION. The important acts passed at the legislative session of 1911 included the following: An important bill recommended by the American Bar Association providing that no verdict shall be set aside or new trial granted or judgment reversed, unless it shall affirmatively appear from the record that injustice has been done by the irregularity which was made the basis of the motion or assignment of error. The number of Supreme Court justices of the State was reduced from six to five, and a resolution was passed authorizing the appointment of a commission of three to investigate the pleading and practice of the State, and make recommendation to the next legislature for a simplified procedure.

STATE GOVERNMENT, 1911: Governor Albert W. Gilchrist; Secretary of State, H. C. Crawford; Treasurer, W. V. Knott; Comptroller, A. C. Croom; Attorney-General, Park M. Trammell; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. M. Holloway; Commissioner of Agriculture, B. E. McLin—all Democrats.

JUDICIARY: Supreme Court: Chief Justice, J. B. Whitfield; Justices, W. A. Hocker, R. F. Taylor, T. M. Shackelford, Charles B. Parkhill, and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

STATE LEGISLATURE, 1911: The legislature is: Senate, Democrats, 32; House, Democrats, 70.

The representations in Congress will be found in the article UNITED STATES, section *Congress*.

FLOUR. See FOOD AND NUTRITION.

FOGAZZARO, ANTONIO. An Italian novelist, poet, and publicist, died March 7, 1911. He was born at Vicenza in 1842. In his early youth he came under the influence of Giacomo Zanella, a priest who endeavored on orthodox lines to reconcile science with religion and liberalism in political matters with subordination to the church. Fogazzaro attended the university at Turin, where he studied law. Here he gave a great many evidences of his great versatility. His first literary efforts, at the age of twenty, were in verse. A poem, *Miranda*, was published in 1874, and this was followed in 1876 by a collection of lyrics entitled *Valsolda*. His appreciation as a poet is perhaps greater in foreign countries than in his own, where the abruptness of his language and his comparative lack of harmony have been severely criticised. Although his chief fame rests upon his novels, he was perhaps more successful from an artistic point of view in his short stories. The first of his published novels was *Malombra*, published in 1881, the writing of which occupied him for six years. It was written at a period when he was engaged in the study of occultism and the book

reflects these studies. *Daniele Cortis*, which appeared in 1885, is considered Fogazzaro's best work. It has been described as "a handbook for idealists." He next began the writing of a trilogy, which includes *Piccolo Mondo Antico*, *Piccolo Mondo Moderno*, and *Il Santo*. The publication of the last in 1906 brought Fogazzaro into direct conflict with the Roman Catholic Church. Although he was a devout Catholic, and regular in the practice and profession of his religion, he had always been a member of the old Liberal party, which held the doctrines of Catholicism less rigidly and took a more comprehensive and less exclusive view of its faith than was strictly consistent with the teachings of the church. There is little doubt that in writing *Il Santo* Fogazzaro intended to further the cause of Modernism as it was understood by him. The high authorities of the church declared the book objectionable and it was condemned by the Holy Office and placed on the Index. Fogazzaro made submission in due form and the matter, so far as he was personally concerned, was dropped. He was not called upon to make any retraction, as indeed no specific retraction could have been suggested. In his next book, *Leila*, published in 1910, however, there is, if not a retraction of the ideals put forth in *Il Santo*, at least an attempt to modify them. Later developments in the Modernist movement showed its adherents in actual open hostility to the authority of the church. This was a position which Fogazzaro had not desired to share or defend. Without condemning his *Il Santo*, he let it be understood in *Leila* that his teachings may have been erroneous. He was a senator and had many academic and other honors. He was perhaps the most widely known of contemporary Italian writers. In addition to the works already mentioned, his best known productions are as follows: *Un Pensiero di Ermete Torranza* (1882); *Il Fiasco del Maestro Chicco* (1885); *Fedeles* (1887); *Il Mistero del Poeta* (1888); *Eva* (1892); and *Nadejde*, a play (1903).

FOLLETT, MARTIN DEWEY. An American jurist and criminologist, died August 22, 1911. He was born at Enosburg, Vt., in 1826 and graduated from Marietta College in 1853. He studied law and was admitted to the bar in 1858. In 1883 he was elected judge of the Supreme Court of Ohio. In 1864 he was a delegate to the Democratic national convention and was Democratic nominee for Congress in 1866 and 1868. He was a student of criminology and in 1900 was a delegate to the International Prison Congress at Brussels. He was a member of many philanthropic and charitable societies. He wrote many reports and addresses on charities, prison reform, etc.

FOOD AND NUTRITION. FOOD INSPECTION. The federal Food and Drugs act of 1906 continued in 1911 to receive aggressive enforcement. A total of 1162 violations of the law were reported for prosecution, a large number than in any previous year, and constituting approximately 40 per cent. of the number for the entire five years during which the act has been in effect. Of 683 cases brought to trial, 336 criminal cases resulted in convictions and the imposition of \$16,000 in fines in addition to costs, and but eleven resulted adversely to the government. Decrees of condemnation and forfeiture were also entered in 275 shipments of

adulterated and misbranded foods and drugs, and large quantities of filthy or decomposed tomato ketchup and other tomato products, frozen and dessicated eggs, and olives were destroyed.

Much attention was also devoted to the inspection of proprietary drugs. An important interpretation of the law was rendered by the Supreme Court with reference to alleged "cancer cures," in which the court held that the law did not extend to the question as to whether a product is effective or worthless to accomplish the properties claimed for it on the label. Following this decision, President Taft addressed a special message to Congress urging the immediate necessity for remedial legislation. Cooperation was, however, still continued with the Post Office Department in the investigation of so-called "cures" for various diseases, and orders resulted which practically suppressed the mail-order cancer-cure business in this country.

The Referee Board of Consulting Scientific Experts reported investigations from which it was concluded that the long-continued use of saccharin is liable to impair digestion, and that as it possesses no nutritive value its use as a substitute for sugar lowers the food value of the sweetened product. Its use in foods entering interstate or foreign commerce, the District of Columbia, or the Territories, was thereupon prohibited after January 1, 1912. Other decisions were also promulgated by the Department of Agriculture prohibiting the artificial yellowing of immature citrus fruits, and regulating the labeling of cocoa and chocolate, molasses, evaporated milk, homogenized milk and similar products, and of charlock when used as a substitute for mustard.

Public interest in the principles of pure food and drug legislation was strongly sustained throughout the year, and attention was acutely directed to the administrative details of the act when charges of a technical nature were preferred against Dr. H. W. Wiley, chairman of the Board of Food and Drug Inspection, and others associated with him in the inspection work. A detailed investigation by a congressional committee was held during July and August, but no recommendations had been filed at the close of the year. In September, however, President Taft, to whom the case had been presented for final settlement, announced his exoneration of Doctor Wiley, and warmly commended his efforts in the cause of pure food and drugs. For food control in the States and in foreign countries, see AGRICULTURAL LEGISLATION.

COST OF FOOD. Although prices of certain commodities decreased during the first half of 1911, *Bradstreet's* estimates for December indicated the highest levels since May, 1910, and with the exception of 1909 the highest ever recorded for December. There was a general upward drift of coffee, sugar, potatoes, eggs, butter, and certain cereals, sugar in particular reaching the highest point for twenty-two years. The chief decreases were in wheat and flour, and in sheep and hog products.

A tendency toward uniformity of prices throughout the year was observed in the case of butter, eggs, and poultry. This was attributed, in a comprehensive study by the United States Department of Agriculture, to the holding of goods in cold storage. The view was taken that the prevailing methods of cold storage are conducive to speculation, and full pub-

licity as to the quantity of goods in storage was recommended as a remedy.

The continuance of the high prices led to much discussion of causes and their removal. There was an evident desire on the part of the general public to solve the conundrum propounded by the Secretary of Agriculture: "The consumer pays a dollar for food; the farmer gets less than fifty cents for it. Who gets the rest?" In many cities there was an effort to bring closer together the producer and consumer by the establishment of a public market system, and the mayor of Indianapolis purchased and sold at reduced prices such commodities as potatoes, turkeys, nuts, etc.

As in previous years the high cost of living was of world-wide prevalence, indicating that its causes were by no means localized. Efforts were being made at the close of the year to secure the appointment of an international commission to investigate the problem in detail.

NUTRITION STUDIES. The public is insisting more strongly each year upon clean food, produced and sold under sanitary conditions. In nine States more stringent legislation was enacted as to the inspection of stores, restaurants, bakeries, dairies, etc. (See AGRICULTURAL LEGISLATION.) Much progress was also made by municipalities and in non-official ways. Among these were the inspection of markets by women's clubs, the devising of score-cards for restaurants, and particularly by the stimulation of the demand for clean milk and other foods, even at the increased prices which the improved methods of handling such goods often necessitate.

Considerable scientific evidence of the importance of sanitary methods was brought out during the year. Foods exposed in stores on tables and racks were proved to become laden with dust and bacteria, while the use of glass cases effected great improvement. Wrapping baker's bread in paraffin paper while still warm from the oven benefited its sanitary condition and quality, and also doubled the period in which it was merchantable. A reddening of codfish during curing, which has caused considerable losses, was traced to bacterial growth, and its prevention to sanitary methods; and similar results attended a study of ham souring in packing-houses, and spoilage of factory-made tomato ketchup. Oysters and other shell fish were again shown to become seriously contaminated when grown or floated in waters exposed to sewage infection, and it was learned that boiling must be prolonged at least fifteen minutes to destroy pathogenic organisms. On the other hand it was estimated that only a relatively small acreage of the oyster beds is now subject to serious contamination.

An extended comparison by English investigators of the nutritive value of breads made from white and other flours corroborated the conclusions drawn by the United States Department of Agriculture several years ago, that the differences in composition between flours of the same grade but different wheats were frequently greater than those between flours from different systems of milling, and that in the average mixed diet the use of white, whole wheat, or graham bread was largely a matter of personal preference. Results with bleaching flour and incorporating various "improvers" were not wholly uniform, but strong arguments were adduced against these practices.

In studies of jelly-making, beet sugar proved

as satisfactory as cane sugar, thus overturning a prevalent opinion. The ability of fruits to jelly was found to depend largely upon their content of pectin and acid, and by the addition of these constituents jellies may be prepared from many fruits hitherto not utilized for the purpose, such as blueberries, strawberries, and cherries. In other studies, cinnamon and clove were found to possess marked preservative action against bacteria, and the more extended use of these spices was suggested in preference to pepper and ginger, which have slight preservative properties.

The nutrition investigations of the United States Department of Agriculture on the more effective utilization of agricultural products as food were devoted especially to a continuation of the studies on cheese. Cheese of all sorts and stages of ripening was found to be very thoroughly digested, and even in large amounts did not cause constipation. Its more extended use in the diet was recommended, and recipes were prepared with this end in view. The respiration calorimeter of the department was still further perfected, and used in an investigation of the ripening of fruits which promises to be of great scientific and practical value.

Additional data were accumulated during the year bearing on the much-debated question of the food requirements of the body, especially as reflected by existing food habits among large groups of people. Further studies of conditions among native tribes of India strengthened previous conclusions as to the intimate relationship between the satisfactory physical development and general characteristics of a people and a generous diet, particularly as regards nitrogen. Other studies indicated that the amount of protein alone is an insufficient measure of the richness of a diet in building material, that there may occur deficiencies in the requisite iron, calcium, and phosphorus, and that in such cases the increased use of milk, cheese, and similar products is a feasible remedy.

Public interest in institution dietetics, notably in the feeding of school children, was well sustained, and instruction in food and nutrition was widely offered. At the close of the year over 1200 collegiate and secondary institutions were providing courses in home economics, of which about 100 were of college grade, 100 normal schools, and 200 institutions for negroes and Indians.

An International Hygiene Exhibition was held at Dresden from May to October, at which one section was devoted to food and nutrition. This brought together a great mass of illustrative material from all over the world. The Second Congress of Alimentation met at Liège October 1-4, under the patronage of the king of the Belgians.

BOOKS OF THE YEAR. Some of the more important books to appear in 1911 were the following: H. C. Sherman, *Chemistry of Food and Nutrition* (New York); G. C. Smith, *What to Eat and Why* (Philadelphia and London); C. Watson, *Food and Feeding in Health and Disease* (Edinburgh and London); J. C. Olsen, *Pure Foods: Their Adulteration, Nutritive Value, and Cost* (Boston and New York); W. and W. C. Jago, *The Technology of Bread Making* (Chicago); G. Pellerin, *Préparation, fabrication, et conservation des denrées alimentaires* (Paris); A. Villiers, E. Collin, and M. Fayolle, *Traité des falsifications et altérations des sub-*

stances alimentaires (Paris); J. Kaup, *Ernährung und Lebenskraft der ländlichen Bevölkerung* (Berlin).

FOOTBALL. The football experts differed at the end of the 1911 season as to whether the tinkering with the rules during the last few years had accomplished the desired aim. The radical changes made were the result of the large number of deaths and serious injuries among the players which led several colleges to abandon the sport entirely in 1908, and aroused widespread criticism on the part of the public. The most important of the new rules were those that did away with mass plays, introduced the forward pass, permitted a player to be taken out and substituted again at any time, and divided the game into four periods instead of two halves.

Statistics gathered fail to show that the innovations decreased the number of deaths and injuries. There were 15 deaths and 166 injuries reported in 1907; 15 deaths and 338 injuries in 1908; 33 deaths and 246 injuries in 1909; 18 deaths and 429 injuries in 1910, and 13 deaths and 509 injuries in 1911.

A secondary aim of the rule makers was to make football a more open game and more interesting from the spectator's point of view. Opinions vary as to whether this purpose was attained. The large number of tie games played since the new rules went into effect caused considerable dissatisfaction. This feeling was augmented by the results of the more important contests played in 1911, and inspired the criticism that the changes made had turned football into a game where a strong defense counted for more than a strong offense. The record of Princeton in 1911 was cited as a proof of this contention.

Princeton's victories over Yale and Harvard, which gave the orange and black team a clear title to the 1911 football championship, were both due to a well-developed and alert defense, the team's playing on the offense being much weaker than its opponents'. Samuel B. White, one of the Princeton ends, won the individual honors of the season by his long runs in the Yale and Harvard games which resulted in touchdowns and brought victory to his team.

According to the majority of the experts the leading Eastern college football teams should be ranked in the following order: Princeton, Harvard, Yale, Navy, Dartmouth, Army, Carlisle Indians, Pennsylvania State, Trinity, Brown, Pennsylvania, Cornell, Lafayette, Georgetown, Syracuse, Williams, New York University, Amherst, Colgate, and Lehigh.

The results of the principal games played by the Eastern colleges follow: Princeton defeated Stevens 37-0, Rutgers 37-0, Villanova 31-0, Colgate 31-0, Holy Cross 20-0, Harvard 8-6, Dartmouth 3-0, and Yale 6-3, and played a scoreless tie with Annapolis, and a 6-6 tie with Lehigh. Harvard defeated Bates 15-0, Holy Cross 8-0, Williams 18-0, Amherst 11-0, Brown 20-6, and Dartmouth 5-3. Harvard lost to Princeton 6-8 and played a scoreless tie with Yale. Yale de-

feated Wesleyan 21-0, Holy Cross 26-0, Syracuse 12-0, Virginia 33-0, Colgate 23-0, New York University 28-3, and Brown 15-0. Yale lost to West Point 0-6, and to Princeton 3-5, and played a scoreless tie with Harvard. Annapolis defeated Johns Hopkins 27-5, St. John's 21-0, Washington and Jefferson 16-0, North Carolina 17-6, West Virginia 32-0, and West Point 3-0. Annapolis played scoreless ties with Princeton, Western Reserve, and Pennsylvania State.

Dartmouth defeated Norwich 18-3, Bowdoin 23-0, Colby 12-0, Holy Cross 6-0, Williams 23-5, Vermont 12-0, and Amherst 18-6. Dartmouth lost to Harvard 3-5, and to Princeton 0-3. West Point defeated Vermont 12-0, Rutgers 18-0, Yale 6-0, Lehigh 20-0, Bucknell 20-2, and Colgate 12-6. West Point lost to Annapolis 0-2, and played a scoreless tie with Georgetown. The Carlisle Indians defeated Lebanon Valley 53-0, Muhlenberg 32-0, Dickinson 17-0, Georgetown 28-5, Pittsburgh 17-0, Lafayette 19-0, Pennsylvania 16-0, Harvard 18-15, Johns Hopkins 29-6, and Brown 12-6. Carlisle lost to Syracuse 11-12. Pennsylvania State College defeated Gettysburg 31-0, Cornell 5-0, Villanova 18-0, Pennsylvania 22-6, Colgate 17-9, and Pittsburgh 3-0. Pennsylvania State played a scoreless tie with Annapolis.

Trinity defeated Amherst 13-0, Colgate 9-0, Wesleyan 14-13, Haverford 24-6, and played a scoreless tie with New York University, and a 6-6 tie with Brown. Brown defeated Bowdoin 33-0, Pennsylvania 6-0, Tufts 30-0, Vermont 6-0. Brown lost to Harvard 6-20, to Yale 0-15, and to Carlisle 6-12, and played a 6-6 tie with Trinity. Pennsylvania defeated Gettysburg 5-3, Franklin and Marshall 14-0, Ursinus 9-0, Dickinson 22-10, Villanova 22-0, Lafayette 23-6, and Cornell 21-9. Pennsylvania lost to Brown 0-6, Pennsylvania State 6-22, Carlisle 0-16, and Michigan 9-11.

Minnesota and Michigan were the two strongest teams among the Western colleges, while Vanderbilt held first rank in the South.

The championship games of the Intercollegiate Soccer League resulted in a tie between Harvard and Haverford, each of which won 3 games, lost 1, and drew 1. Columbia finished second with 2 victories, 1 defeat, and 2 draws. Pennsylvania won 2, lost 3; Yale won 1, lost 2, and drew 2, and Cornell won 0, lost 3, and drew 2. The Crescent A. C. won the championship of the Field Club Soccer League of New York and New Jersey, going through the season without suffering defeat. The final standing of the clubs in the league follows: Crescent A. C. won 7, lost 0; Staten Island F. C. won 6, lost 1; Oritani F. C. won 4, lost 4; Montclair A. C. won 1, lost 7; Bensonhurst F. C. won 1, lost 7.

A feature of the soccer season was the tour made by the Corinthians of England through Canada and the United States. The visitors only lost one game to the All-Toronto team. The English Soccer League championship was captured by Manchester United, which won 22 games, lost 8, and drew 8. The annual match between Oxford and Cambridge was won by Oxford by a score of 3 to 2.

FOREST, JOHN ANTHONY. An American Roman Catholic bishop, died March 11, 1911. He was born in St. Martin's, Saint Germain, France, in 1838 and was educated for the priest-

hood in that country. In 1863 he immigrated to the diocese of Galveston, Texas. After filling several pastorates in that city he was consecrated bishop of San Antonio, in 1895.

FORESTRY. Among the important occurrences in the forestry situation in this country since 1907 are the extension of the area of the national forests from 162,278,358 acres in 1907 to 168,165,163 acres in 1911; the division of the national forests into six districts with headquarters at Missoula, Mont., Odgen, Utah, Portland, Ore., Denver, Col., San Francisco, Cal., and Albuquerque, N. Mex., in order to facilitate administration; the passage of a law providing for the Appalachian and White Mountain national forests; and the enormous fire losses in 1910, when timber valued at more than \$175,000,000 was destroyed, several towns in Idaho burned, and 78 persons killed while fighting the fires. The expense of bringing these fires under control was more than \$1,500,000. Congress in 1911 appropriated an emergency fund of \$1,000,000 to be available for fire control.

A notable event during the past year was the ruling of the United States Supreme Court affirming the right of the Secretary of Agriculture to make regulations for the management of the national forests, thus definitely establishing a forest policy for the United States government. Fortunately the country was spared the enormous fire losses that characterized 1910, although in some of the forests the conditions were favorable for destructive fires. A better system of patrolling the forests, developed from the experience of the previous year, aided very materially in reducing the number and extent of the forest fires. In Maine there were serious forest fires in the summer of 1911, and the State fund for fire protection, supplemented by \$10,000 from federal sources, was exhausted in bringing them under control. A fire broke out near San Bernardino, Cal., on July 25, and before it was stopped 19,000 acres, most of which was covered with chapparal, had been burned over.

The annual meeting of the American Forestry Association was held in Washington, D. C., in January, 1912. The Hon. R. P. Bass, governor of New Hampshire, who succeeded Hon. Curtis Guild when the latter was appointed ambassador to Russia, was reelected president. The Association of Eastern Foresters met at Lake Saranac, N. Y., July 14 and 15, 1911. A Forestry Convention of the Dominion of Canada was held in Quebec, January 18-20, 1911. In connection with the International Agricultural Congress at Madrid, the section of forestry adopted a series of resolutions which are concerned with the subject of state reafforestation. Meetings of the supervisors and forest assistants were held in each of the forest districts of the national forests. There have been organized thirty-two State and local forestry associations in the United States, most of which have annual meetings.

The exports of forest products from the United States for 1911 were valued at \$103,000,000, of which lumber furnished \$60,000,000, timber and logs \$17,000,000, and naval stores \$25,000,000.

During the same period the imports were valued at \$164,000,000, as follows: Lumber, \$21,000,000; wood pulp, \$14,000,000; rubber, gums, etc., \$129,000,000. A compilation of recent specifications for railroad ties showed that seventy-eight species of trees will be accepted in the United States for that purpose. Some of the species require preservative treatment for the best results.

THE NATIONAL FOREST SERVICE. During the past year, in order to facilitate administration, the national forests were divided into somewhat smaller units. At the end of the fiscal year 1911 there were 153 forests under administration, the average area being 1,070,545 acres. The total net area within the boundaries of the 156 national forests on June 30, 1911, was 168,165,163 acres, 4,598,705 acres having been eliminated and 2,806,267 acres added by presidential proclamation during the fiscal year. The distribution by States was as follows:

**NATIONAL FOREST AREA BY STATES,
JUNE 30, 1911**

State	Acres
Arizona	13,883,452
Arkansas	1,184,012
California	21,104,069
Colorado	13,408,138
Florida	318,960
Idaho	18,139,435
Kansas	156,376
Michigan	84,011
Minnesota	844,473
Montana	16,192,504
Nebraska	521,065
Nevada	5,424,254
New Mexico	9,810,522
North Dakota	6,224
Oklahoma	61,028
Oregon	13,740,139
South Dakota	1,073,780
Utah	7,201,695
Washington	9,914,314
Wyoming	8,420,497
Alaska	26,643,260
Porto Rico	32,975

On July 1, 1911, further additions of 364,480 acres and eliminations of 84,969 acres became effective. The receipts from the national forests during the fiscal year 1911 were: From timber, \$1,014,769.84; from grazing, \$935,490.38; and from special uses, \$76,645.93; a total of \$2,026,906.15. Of this amount \$482,376.73 will be paid to the several States and Territories, under the existing law, to be expended on roads and schools. The total timber cut of the national forests last year was 498,166,000 board feet, valued at \$1,039,923.13, a slight falling off from 1910, due to somewhat lower stumpage values, but more especially to the increased ratio of the cut under free use. The approximate stand of timber, including cordwood, in the national forests, exclusive of Alaska, is given at 518,000,000,000 board feet. An estimate of the timber in the Alaska National Forests is 69,000,000,000 feet.

The Weeks bill, for acquiring forest land in the Appalachian and White Mountain regions, became a law March 1, 1911, making \$2,000,000 available for the purchase of land. Proposals covering 1,250,000 acres have been received, and a liability of \$224,000 has already been entered into for the purchase of 31,377 acres.

In his last report to the Secretary of Agriculture the forester calls attention to the presence in the national forests of approximately

15,000,000 acres of land suited to forest purposes that have been denuded by fire. Natural means will reforest half of this area, but there still will remain 7,500,000 acres, which will have to be artificially reforested. The Forest Service has begun experimental work on the most economical methods of reforestation, and during the year 23,235 acres were seeded and 1995 planted to various forest tree species. In connection with this work thirty forest nursery stations are maintained, the present stock of which is about 35,000,000 seedling and transplanted trees. The special laboratory of the Forest Service at Madison, Wis., has been well equipped and is conducting investigations on various forest products. These include technical studies of the physical characteristics of different woods, the utilization of inferior and waste timber, wood pulp, paper, etc. As a result of four years' continuous experimentation, it has been found that light chipping of pine trees prolonged the turpentine period, caused less loss of merchantable timber, and resulted in a considerable increase in the yield of turpentine per crop. Under cooperative agreement the Forest Service is studying the forest resources of South Carolina, Mississippi, Louisiana, Florida, Tennessee, North Carolina, Virginia, and Illinois; protecting the watersheds of navigable streams against fires, in which case the States must appropriate a sum equal to that spent by the federal government; and the examination of individual timber tracts for the purpose of advising owners as to proper methods of management. The personnel of the Forest Service for 1911 embraced 2624 employees, and the total resources for the same period were \$5,954,898.52.

PROGRESS IN STATE FORESTRY, LEGISLATION, ETC. In the Philippines the privilege of free use of timber under certain restrictions has been continued for another period of five years. There had been entered to June 30, 1910, 183 private woodlands, embracing about 726,000 acres. Three special forests, of about 1,360,000 acres, have been set aside, and they will be brought under conservative management as soon as funds are available. Forty-two communal forests have been established, and applications are pending for ninety-one more. The forest school for native rangers has proved a success, and twenty-four pupils were enrolled the first year. Forest nurseries have been established in connection with forest extension experiments. The gross revenue from the Philippine forests for 1910 was 271,581.74 pesos, and the expenditures were 152,161.33 pesos. Arrangements have been made by the Philippine Bureau of Forestry for the sale of prepared specimens of the 400 or more species of merchantable woods of the islands. In Hawaii on February 10, 1911, there were twenty-three forest reserves, comprising 575,154 acres, about three-fifths of which are government land. The experimental introduction of rubber trees on the Island of Maui has progressed to the stage that tapping was begun in November, 1911, on 5000 trees.

A recent report shows that in Massachusetts more than 2000 acres have been planted under the direction of the State forester and 1500 acres by private parties, water and sewerage boards, etc. Two small demonstration forests have been established in Maryland. The New York State Conservation Commission was created by a law approved July 12, and among its duties are those formerly exercised by the Forest, Fish,

and Game Commission. The Department of Forestry of New York sold during the spring of 1911 over 1,700,000 trees for planting. The Ohio legislature appropriated \$19,400 for forestry investigations in 1911-12. In Pennsylvania and neighboring States the chestnut trees are threatened by the chestnut bark disease, and the legislature of Pennsylvania appropriated \$275,000 for its study and control. The federal government has also begun an investigation along similar lines. A report of the Tennessee Geological Survey shows that about 35 per cent. of the area of the State is in forests, a large part of which should be continued as such. Vermont has lately been given two tracts of forest land, amounting to about 900 acres and including some of the highest points in the State, to add to its forest system. The legislature has increased its appropriations for forestry work to \$20,000. California, Oregon, and Washington have been active in forestry legislation, especially in regard to protection from fires. Minnesota has adopted what has been termed a model forest code. Wisconsin has strengthened its forest laws and has made appropriations for additional purchase of forest lands. Florida, Louisiana, and New Hampshire have enacted important changes in their laws relating to forests. The planting operations of the Pennsylvania Railroad Company in the spring of 1911 included about 50,000 trees, mostly red oak and Scotch pine. The Delaware & Hudson Railroad and the New York, New Haven & Hartford Railroad have both taken up active work on forestry problems.

FORESTRY IN FOREIGN COUNTRIES. In Canada a new Forest Reserve act was adopted in May, 1911. Changes have been made in the forest reserves, the total area now being about 16,119,000 acres. During 1910 there were cut under timber license from the reserves in Canada 27,000,000 board feet of lumber, and in addition a large amount of poles, posts, and wood was cut under settlers' permits. In Prussia the net income from the forests under the Forest Department for 1911 was estimated at \$18,500,000. The average cut is given at fifty-four cubic feet from nearly 7,000,000 acres. The number of persons engaged in forest management in 1911 in Prussia was 6125. The public forests of Austria embrace about 2,800,000 acres, from which a net income of \$950,000 was estimated for 1911. Free wood and other rights valued at over \$300,000 were granted in addition. The Norwegian forests are estimated at 26,945 square miles. Of this area about 17,000,000 acres are productive and the state controls 2,500,000, all of which is under systematic management. The forests of Sweden are said to be owned by private individuals and the state in the proportion of 75 and 25 per cent., respectively, but the privately owned lands are under the control of county conservation boards to a considerable extent. Italy, in connection with its forest system, has just provided for a Forestry Institute for the technical training of forest officers. The Belgian minister of agriculture has submitted a report on fires and fire control. A committee has been appointed to select a site for forest demonstration work in Scotland. In India 24.5 per cent. of the total area has been brought under the control of the forestry department, and working plans covering 8,540,000 acres are in operation, and half the total forest area is under protection. In Burma at the end of

1910 65 per cent. of the area was under forest. Practically all the most valuable teak-producing regions are now included in forest reserves. Extensive planting operations have been begun in New Zealand.

FORESTRY SCHOOLS, PERSONNEL, ETC. The oldest forest high school in Germany, that at Aschaffenburg, Bavaria, closed its doors in 1911 after ninety years of service. A school for rangers has lately been established in Burma. There are now sixty-nine institutions in the United States which give graduate or undergraduate instruction, and efforts are being made to standardize their instruction. The Yale Forest School has received a gift of \$100,000 for a new building, and a like amount for the endowment of a chair of instruction in forest management. A State college of forestry has been established by the New York legislature at the University of Syracuse, and \$55,000 appropriated for it; and after a lapse of eight years the forestry department of Cornell University has been reopened. Lehigh University, the University of Vermont, and New Hampshire State College have established forestry courses. A school for forest rangers has been provided at the University of Wisconsin, the work covering two years, and short courses in the instruction of rangers have been provided at a number of Western institutions, notably at the universities of Colorado, Montana, and Washington.

Among the books treating of some phases of forestry that appeared in 1911 are: B. E. Fernow, *History of Forestry*, revised and enlarged; H. N. Whitford, *Forests of the Philippines*; H. S. Graves, *The Principles of Handling Woodlands*; Isaiah Bowman, *Forest Physiography*; F. S. Matthews, *Familiar Trees and their Leaves*, third edition.

FORMOSA, or TAIWAN. An island off the Chinese coast, a Japanese dependency. Area, as officially estimated, 2324 sq. ri (13,841 sq. miles). Estimated population, 3,392,063. The census of October 1, 1905, showed a population of 3,039,751 (of whom 2,673,280 Formosans), or a resident population of 3,047,391. The census did not include the savage inhabitants and covered only the portion of the island under actual Japanese control, that is, the western part, and a strip along the east and south coasts, or an area of 1222 sq. ri (7277 sq. miles). The Japanese are steadily enlarging their administrative territory. Estimated resident population of the principal towns, December 31, 1908: Dai-Hoku (Taihoku or Tai-pei), the capital, 87,745; Dainan (Tainan), 54,086; Rokko (Lukong), 19,124; Kagi (Chia-i), 19,749; Kiilung (Keelung), 17,858. The 1905 census showed that 97.62 per cent. of the inhabitants were illiterate, but the Japanese are developing an educational system. At the end of 1907 there were 1126 schools of all kinds, with 1944 teachers (1828 men), and 59,321 pupils (52,907 boys).

The leading agricultural products are rice, tea, sugar, sweet potatoes, ramie, jute, and tumeric. The sugar industry is showing a notable development. Camphor (a government monopoly) is worked in the forests. Total area under all crops (estimate 1909), 1,618,800 acres. Livestock (1904): 227,000 water buffaloes, 89,000 oxen, 977,000 swine, 117,000 goats. Gold output (1908), 429,241 momme (1 momme = 3.75 grammes). Coal, silver, sulphur, and petroleum are mined. Fishing is carried on; and the

chief manufactures are sugar, flour, oil, tobacco, spirits, soap, glass, bricks, and ironwork.

The trade is largely with Japan, and in 1910 amounted to 48,923,000 yen imports and 59,923,000 yen exports (1909, 36,597,000 and 47,998,000 yen respectively); Japan furnished imports to the value of 29,070,000 yen and received exports valued at 47,937,000 yen (1909, 24,007,000 and 36,310,000). Government railway in operation in 1911 (since 1908), 271 miles. Plans for two branches of 60 and 41 miles have been adopted. In addition, there is a considerable mileage of private light railways to the sugar plantations, etc. Telegraph lines, 1000 miles; wires, 3000. Telephone lines, 790 miles; wires, 4030. Post offices (1909), 127. Estimated revenue (mostly from inland taxes, customs, and Japanese subsidies) and expenditure (chiefly for internal administration and public works) balanced at 29,951,449 yen for the fiscal year 1910; 38,689,763 for 1911; 43,651,651 for 1912. A governor-general (1911, Lieut.-Gen. Count Sakuma) administers the dependency.

FORTIFIED WINES. See LIQUORS.

FT. SCOTT. See KANSAS.

FORTUNA ISLAND. A dependency of New Caledonia (q. v.).

FOSS, EUGENE M. See MASSACHUSETTS.

FOSS, SAM WALTER. An American librarian and poet, died February 25, 1911. He was born in Candia, N. H., in 1858 and graduated from Brown University in 1882. From 1883 to 1887, he was editor of the *Saturday Union* of Lynn, Mass., and from 1887 to 1894 edited the *Yankee Blade* of the same city. He did general writing from 1894 to 1898 and in the latter year became librarian of the Somerville public library. He published many poems which were widely read. These were collected in several volumes: *Back Country Poems*, (1894); *Whiffs from Wild Meadows* (1895); *Dreams in Homespun* (1897); *Songs of War and Peace* (1898) and *Songs of the Average Man* (1907).

FOSSILS. See GEOLOGY.

FOSTER, FRANK PIERCE. An American physician and teacher, died August 13, 1911. He was born in Concord, N. H., in 1831 and was educated in the schools of that city. He graduated from the College of Physicians and Surgeons in 1892 and for two years following took hospital courses. In 1865 he was acting assistant surgeon in the United States army. He engaged in general practice in New York City and was at the same time editor of the *New York Medical Journal*. He was co-author of the *Illustrated Encyclopædia Medical Dictionary*.

FOUNDATIONS. The most important building foundations of the year were those of the new Woolworth building, a 775-foot high structure, under erection in New York, on Broadway, between Barclay Street and Park Place. This building is fifty-five stories, with an estimated weight of 125,000 tons, and was designed in accordance with the building code of the city of New York, which permits a load of fifteen tons per square foot on the foundations. The steel framework comprising the structure contains 20,000 tons of steel, and the various columns are supported on sixty-nine piers of partly reinforced concrete, which were sunk through a deep bed of quicksand down to solid rock, at a distance of 110 feet below the sidewalk. The caissons used in building these

piers were either circular or rectangular shafts, and varied from 8 ft. 3 in. to 8 ft. 9 in. in diameter. They were loaded to a maximum of eighteen tons per square foot. In most cases the axes of the supporting columns coincide with the axes of the caissons, but where it was found necessary to place the columns eccentrically the load was transferred to the centre of the caisson by means of heavy steel girders, which acted as cantilevers. These girders were perfectly massive and stiff, two inches in thickness in the web, and having an average depth of eight feet.

FOURTH OF JULY ACCIDENTS. See TETANUS.

FRANCE. A republic of western Europe, having (with Belfort) 87 departments. Capital, Paris.

AREA AND POPULATION. Area, 536,464 sq. kilometers (207,129 sq. miles). Population (1906), 39,252,245. A census was taken in March 11, 1911; the returns show an increase during the last decade of 349,264, making a total population of 39,601,509. The gain was chiefly in the cities, the rural districts showing a decrease. Of the increase not more than half is attributable to the excess of births over deaths, the remainder being due to immigration, particularly notable near the Italian and Belgian frontiers. Marriages, 1909, 307,951; 1910, 309,289. Divorces, 1909, 12,874; 1910, 13,049. Living births, 1909, 769,969 (stillbirths, 35,914); 1910, 774,358 (35,944). Deaths, 1909, 756,545; 1910, 703,777. Surplus of births over deaths, 1909, 13,424; 1910, 70,581 (the extraordinary surplus in 1910 was due to a decreased death-rate, rather than to an increased birth-rate). Population (1911) of Paris, 2,888,110; Marseilles, 550,619; Lyons, 523,796; Bordeaux, 261,678; Lille, 217,807; Nantes, 170,535; Saint-Etienne, 148,656; Toulouse, 149,576; Nice, 142,940; Havre, 136,159; Rouen, 124,987; Roubaix, 122,723; Nancy, 119,949; Rheims, 115,178; Toulon, 104,582. Population of Paris in 1872, 1,851,792; in 1886, 2,344,550; in 1906, 2,763,393.

EDUCATION, ETC. Primary education is free and compulsory. In 1909 the conscription list carried 315,452 men of the class of 1908, of whom 3.19 per cent. could neither read nor write, 1.21 per cent. could read only, 26.74 possessed the rudiments, and 64.20 a fair elementary education; the remainder had received secondary instruction.

Kindergarten schools (1908-9), 3986; of which 2648 were public and 1169 private lay schools, and 12 were public and 157 private clerical schools. Teachers in all schools, 8539 (277 clerical). Children in lay schools, 604,798; in clerical, 23,125; total in all schools, 627,923 (318,102 boys, 309,821 girls).

Primary schools (1908-9): 81,847 (1003 clerical). Instructors, 154,586 (3217 clerical). Pupils, 5,629,906 (5,613,927 in lay and 115,979 in clerical schools). Higher primary schools (1906-7), 2034; with 5514 teachers and 87,668 pupils. Primary normal schools (1909-10), 169; with 1718 instructors and 9450 students. State expenditure on primary instruction (1908), 209,267,437 francs.

Secondary schools (1909): 343 for boys, with 97,128 pupils; 119 for girls, with 28,692. Students in state universities (1910), 41,044. There are special and technical schools and colleges of all kinds; normal schools; schools of art and

science; besides military, naval, and commercial colleges.

The state especially protects no religion, but expended in 1911 about 310,000 francs in pensions and allowances to the Roman Catholic clergy. Total voted in 1911 for worship, 476,100 francs.

AGRICULTURE. In 1908 the surface of the country was divided as follows: 23,590,915 hectares under cultivated crops, including sown meadows; 4,847,900 under natural meadows; 1,478,160 under forage; 3,601,830 under pasture; 1,723,635 under vines; 1,247,638 under divers industrial plants, truck gardens, etc.; 9,300,760 under woods and forests; 3,951,970 uncultivated lands; 3,203,177 not included in above categories; total, 52,954,085 hectares. Area (in hectares) under principal grain crops and yield (in thousands of quintals) for 1910 and 1911 (1911 yield preliminary), with the yield per hectare in 1910, are as follows:

	Hectares 1910	1911	1000 quintals 1910	1911 per ha.	Qs. per ha.
Wheat ...	6,554,370	6,331,350	68,846	87,128	10.5
Rye	1,211,730	1,163,410	11,147	12,222	9.2
Barley ...	748,480	774,425	9,713	11,094	13.0
Oats	3,951,300	4,040,100	48,171	50,843	12.2

Area (in acres) and yield (in bushels or tons) of other crops in 1909, 1910, and 1911 (1911 preliminary):

	1909	1910	1911
Maslin, area....	350,000	339,700	301,800
Maslin, yield....	5,619,000	5,426,000
Potatoes, area....	3,823,600	3,765,800	3,837,463
Potatoes, yield....	613,041,000	308,885,036	423,573,472
Beets, area*....	585,100	575,900	591,829
Beets, yield a....	6,894,000	5,701,559	4,255,925
Beets, area†....	121,400	129,505	134,766
Beets, yield a....	2,171,000	2,093,896	1,532,434
Beets, area‡....	1,633,100	1,597,427	1,629,130
Beets, yield a....	25,529,000	23,122,837	16,315,186

* Sugar beets. † Distillery beets. ‡ Fodder beets. a In tons (2000 lbs.).

Area sown to corn in 1907, 1,236,000 acres; production, 23,284,000 bushels (24,000,000 bushels in 1908). Buckwheat, 1,243,000 acres; 20,585,000 bushels. Hay and grasses crop, 402,898,000 cwt. Olives (about) 328,648 acres, 125,000 tons. Area planted to vines (exclusive of Corsica) in 1909, 1,625,629 hectares; production, 54,445,860 hectoliters (33 hectoliters per hectare; value, 980,025,480 francs (18 francs per hectoliter). In 1910, 1,617,659 hectares, 28,338,843 hectoliters, 1,105,214,877 francs (on the basis of 39 francs per hectoliter). The price in 1910 (the highest since 1886) more than offset the yield of the year previous. The preliminary figures for 1911 place the yield at 44,885,550 hectoliters. In the champagne district, however, only about 160,000 hectoliters are reported—not more than a third of the normal yield. The cider production in 1909 was 9,755,014 hectoliters; in 1910, 12,333,102. Hay and forage crops in 1909, 830,984,000 quintals; value, 3,453,663,000 francs. Value of fruit and market-garden products, 277,890,000 francs.

Livestock (December 31, 1909): 3,236,000 horses; 14,298,000 cattle; (1908) 17,456,380 sheep; 7,202,430 swine; 1,124,870 goats.

MINING AND OTHER INDUSTRIES. No later figures were available than were given in the YEAR BOOK for 1910 and they will therefore not be repeated in detail. The output and value of the chief mining products in 1908 were as follows:

Coal, 36,633,000 tons, 584,341,000 francs; iron ore, 10,057,000 tons, 45,538,000 francs; salt, 708,784 tons, 10,849,817 francs. In 1907 the output from all quarries was 248,183,265 francs. According to the 1901 census the manufacturing industries employed 5,819,855 persons; the extractive industries, 268,351; and fishing, 67,772. The sugar yield in 1908-9 was 723,081 tons, against 656,872 in 1907-8. The alcohol production in 1908 was 55,836,000 gallons, against 55,326,000 in 1907. In 1908 the state match monopoly yielded a net profit of 29,453,964 francs and the profits of the state monopoly of manufactured tobacco were 389,735,000 francs.

COMMERCE. The general and special trade is shown below in thousands of francs:

	Imports		Exports	
	Gen.	Spec.	Gen.	Spec.
1908	7,180,400	5,640,500	6,620,300	5,050,700
1909	7,856,500	6,246,115	7,482,300	5,718,054
1910*	8,102,600	6,759,850	8,104,900	6,005,735

* Final figures place the imports in the special trade at 7,173,300,000 francs; the exports at 6,233,800,000.

Imports of coin and bullion 1908, 1,173,000,000 francs; 1909, 540,000,000; exports 1908, 114,000,000; 1909, 361,000,000. Trade (special) by great classes for 1909 and 1910 in thousands of francs:

1910 C						
.....	6,246,234	15,631,219	20,842	21,877	

COMMUNICATIONS. Railways (December 31, 1910): 40,632 kilometers of main, 8900 of local lines. The railways are nearly all conceded for a term of years, reverting ultimately to the state. Progress was made on the underground railways at Paris during the year, and these great projects were satisfactorily nearing completion. Work was being done on the last section of the "Metropolitaine," which involved two crossings under the Seine, while the section between the Pont de la Concorde and the Opéra was completed. The extension of the Nord-Sud line to St. Ouen and the Clichy Gate was under way. An important engineering project was the Jaca-Oléron line, connecting France and Spain, 57 miles in length. This line included a long tunnel and was being built over mountainous country. Another railway from France to Spain was that between St. Giron and Lérida. This also is a mountainous line, and includes 78 tunnels and 68 viaducts. Railway construction along the southern frontier was very active in France, and the electric line from San Sebastián to Hendaye was nearing completion. Length of telegraph lines (1909), 178,878 kilometers; wires, 659,323; telephone lines, 129,036; wires, 1,188,330. Post offices, 13,631. Post office receipts (1909), 339,472,748 francs; expenses (posts and telegraphs), 303,763,504; telegraph receipts, 61,854,350.

FINANCE. The franc (1 franc = 19.3 cents) is the monetary unit. Financial statistics are given in francs as follows (1911 estimate):

	1909	1910	1911
Revenue	.4,140,912,961	4,233,254,003	4,384,072,839
Expend.	.4,186,090,463	4,222,949,817	4,386,462,181

Details of the 1911 budget (July 13, 1911):

* Matches, tobacco, and gunpowder. † Costs of administration and collection of taxes.

The foregoing table is not inclusive of a total of 659,322,170 francs (receipts and expenditures balance) for special services—railways, pensions, Legion of Honor, government printing, etc. The sum of the deficits from ordinary budgets from before 1814 to end of 1908 was 1,687,473,140 francs. The difference between actual revenue and actual expenditure is still greater.

Capital of national debt (exclusive of annuities), January 1, 1910, 31,432,175,630 francs; floating debt, 1,432,180,600.

NAVY. The number and displacement of war ships of 1000 tons and over, and of torpedo craft of 50 tons and over, built and building, in 1911, were placed at 424, of 741,425 aggregate tons, detailed as follows: 4 dreadnoughts (all building), of 92,368 tons; 20 first-class battleships, of 286,005 tons; 2 second-class battleships, of 15,400; 22 armored cruisers, of 211,070; 3 cruisers (over 6000 tons), of 24,022; 5 cruisers (6000 to 3000 tons), of 21,250; 2 cruisers (3000 to 1000 tons), 4706; 72 torpedo-boat destroyers, of 26,782 (and 13 of 9170 building); 200 torpedo boats of 19,166; 66 submarines, of 22,304 (and 15 of 9182 building). Not included in the foregoing are vessels over 20 years old, unless reconstructed and rearmored since 1905; transports, colliers, repair ships, converted merchant vessels, or other auxiliaries; vessels under 1000 tons, except torpedo craft; torpedo craft under 50 tons.

Commissioned in 1911 were five of the six battleships of the *Danton* class (each, 18,029 tons), authorized 1906, laid down 1907-8, launched 1909. The remaining vessel (the *Vergniaud*) will be completed in 1912. The *Jean Bart* and the *Courbet* were launched in September, 1911, to be completed 1913; the *France* and the *Paris* are expected to be completed in 1914. The armored cruiser *Waldeck Rousseau* was finished in 1911. The submarines *Gustave Zédé* and *Néréide* were begun in 1911. The battleship *Liberté* was destroyed by fire and explosion, September 25, 1911, in Toulon harbor (see *History*, paragraph "The Toulon Disaster"), and the minister of marine has asked for funds for a new battleship to replace her in addition to those already authorized.

Naval expenditure in 1911, 416,431,000 francs. Personnel (1911), 58,649 officers and men.

ARMY. The French army is recruited by conscription, each citizen being liable for service

between the ages of 20 and 45, serving 2 years in the active army, 11 years in the reserve, 6 years in the territorial army, and 6 years in its reserve. The army was organized in 20 army corps, exclusive of the garrison of Paris and the army in Tunis, the headquarters of the various corps being as follows: Lille, Amiens, Rouen, Le Mans, Orléans, Châlons-sur-Marne, Besançon, Bourges, Tours, Rennes, Nantes, Limoges, Clermont-Ferrand, Lyons, Marseilles, Montpellier, Toulouse, Bordeaux, Algiers, Nancy. The total effective strength on January 1, 1911, was 555,045 men with the colors, and 40,625 non-combatants.

The number of recruits enrolled in October, 1910, was 224,000, instead of 202,000 as had been estimated on the basis of the birth statistics. The discrepancy was due to the fact that the survivals to the military age have risen from 67 per cent. to 70 per cent. of the males born. The total enrolled was, however, 5850 less than in 1909, owing to the decline of the birth rate, which had fallen since 1905 from 850,000 to 700,000, 393,000 of the latter number being males. On account of the stricter enforcement of the medical regulations 2400 more conscripts were rejected in 1910 than in 1909.

The experiment of sending Senegalese, and other black regiments, to Algeria was successful, and it was thought that soon it might be possible to release the Algerian troops for service in Europe. As regards mobilization of the French army, the position was considered satisfactory. By mobilizing eleven classes of the reserve and the two classes of the active forces, a first line army of 2,500,000 men could be placed in the field, which would be equivalent to the Germany army with its two active classes, its reservists of from 22 to 28 years of age, and its Landwehr of from 28 to 32 years.

The corps cavalry was to be reduced from a brigade to a regiment per corps, and all non-corps cavalry was to be formed into cavalry divisions. A new law provided 60 regiments for the cavalry divisions instead of the 36 which had hitherto been available. Each cavalry division was to be increased by a battalion of 350 cyclists. The reorganization of the artillery continued, a main object being the separating of establishments designed to provide material and munitions for the field army from bureaus organized to carry out similar functions for the fortresses. The "mignonette" service uniform introduced experimentally in 1910 at a cost of some 356,000 francs was abandoned during the year. A new uniform dress of gray-green corduroy was to be issued experimentally during 1912.

GOVERNMENT. The executive authority is vested in a president, elected for seven years by the National Assembly; he is assisted by a cabinet responsible to the Chamber. The legislative body is the National Assembly, composed of a senate (300 members elected indirectly for nine years) and a chamber of deputies (584 members, elected by universal suffrage for four years). President Armand Fallières (1911) was born November 6, 1841; elected January 17, 1906. The cabinet as constituted June 27, 1911, was as follows: President of the Council and Minister of the Interior and of Worship, Joseph Caillaux; Justice, Jean Cruppi; Foreign Affairs, Justin Germain Casimir de Selves; Finance, Louis Lucien Klotz; War, Adolphe Messimy; Marine, Théophile Delcassé; Instruc-

tion and Fine Arts, Jules Joseph Théodore Steeg; Public Works, M. Augagneur; Commerce and Industry, M. Couyba; Agriculture, Jules Pams; Colonies, M. Lebrun; Labor, René Renoult.

HISTORY

FOREIGN AFFAIRS: THE RUSSIAN ALLIANCE. The Potsdam meeting between the czar and the kaiser and their respective foreign ministers in the autumn of 1910 was much discussed during the early part of 1911 in connection with its bearing on the Russo-French Alliance. As a result of the meeting a convention concerning Persian railways was formed between Russia and Germany on January 13 and signed on August 19. Through an indiscretion of some one in the diplomatic service, the Russian note which formulated the decisions of the conference and was transmitted to Berlin, was published in a London newspaper. Although the German government announced that the negotiations were still going on and that the newspaper version of the note was not authentic, the main points of the agreement were at this time anticipated as appeared when the official version became known later. For an account of the terms, see *GERMANY*, paragraphs on *History*. Despite official assurances that this convention did not menace existing alliances, but was, in fact, a pledge of peace in Persia, there was much adverse comment upon it in the French press. The chief objection raised was that Russia, which had hitherto opposed the Bagdad line, now withdrew its opposition without consulting the cabinets of Paris and London. Russia had been accustomed to act in accord with France and Great Britain on the question of the Bagdad Railway. But now she consented to concessions greatly to the advantage of Germany without apprising the other two members of the Triple Entente. This was regarded as marking the beginning of the dissolution of the understanding between Great Britain, France, and Russia. The matter came up in the French Chamber on January 17 when the budget of the Foreign Office was under discussion, and M. Pichon in reply to questions in regard to it declared that the Potsdam convention did not affect the Russo-French Alliance. He declared that it was "not the business of any country but Turkey to say that this or that line of railway shall or shall not be constructed in the Ottoman empire." Nevertheless the feeling prevailed that this Russo-German agreement foreshadowed the end of French and Russian coöperation.

FRANCE AND MOROCCO. The most absorbing topic in international politics throughout the year was the policy of France in Morocco. The French expedition to Fez, the sending of a German gunboat to Agadir, and the negotiations between France and Germany resulting in a new agreement concerning Morocco, after a period of anxiety and suspense during which it was feared that war might break out between the two countries or between England and Germany, are described under *MOROCCO*, paragraphs on *History*. Here the Moroccan affair is considered only with reference to the internal politics of France. In the course of the discussion of the budget for Foreign Affairs in the middle of January, M. Pichon declared the French-Moroccan policy to be merely one of "pacific penetration and economic progress." On this

occasion, as on many others both before and afterwards, the Socialists assailed the government for its aggressive course. M. Jaures, appealing to the principles of international peace, protested against the military occupation of Morocco, and deprecated military and financial alliances. Early in March, following interpellations of the new ministry, he denounced the banks for exploiting the Moroccan loan for profit, and demanded that the sultan's hands be strengthened, and that no irregular military action be taken. On the other hand, the great majority in the Chamber and French public opinion generally were favorable to a vigorous Moroccan policy and against any backward step. It was feared that the new foreign minister, M. Cruppi, might not maintain the policy of M. Pichon. He assured the Chamber, however, that the government would proceed on the same lines, consolidating the results of French military expeditions and political actions. He announced the government's programmes as follows: (1) To increase by about 2000 men the force of occupation in Shawia, which then numbered only 5000, and were scattered over a wide area; (2) to supply Mulai Hafid with the means of punishing the Zaers for their recent aggressions, in accordance with his promise which the government had accepted; (3) to authorize a loan of 15,000,000 fr. for the payment of debts incurred prior to June 30, 1909, and a loan of 43,000,000 fr. for public works, namely the building of ports at Tangier and Casablanca, and of a railway from Tangier to Alcázar. He said the reinforcement of the troops was not in contemplation of a military expedition, but on the contrary was aimed at making such an expedition unnecessary, that France and Spain would continue in cordial coöperation, and finally, that the financial arrangements tended to promote the economic interests of Morocco, relieve the sultan of burdens, and permit the carrying forward of important works. Confidence was voted by 365 against 74. This announcement was met with disfavor in Spain where the railway was disapproved and the French government blamed for not keeping Spain informed of the negotiations concerning a loan.

The council of ministers held on March 13 decided in favor of reinforcing the French army at Casablanca and of a financial arrangement with the Maghzen which would supply the sultan with the means of maintaining a serviceable army of 5000 men and keep up the police in the ports. The Morocco state bank was to issue two financial loans and France was to renounce for the time being the instalments of the war indemnity. It was also decided to require the sultan promptly to carry out his undertaking to punish the Zaers. In the course of an address on the government's foreign policy on April 7, the foreign minister announced that the Shawia region was tranquil. The difficulties with the tribesmen around Fez were, however, serious, and the government had adopted effective measures for helping the Maghzen to pay the troops and keep them in the field. If the situation became more grave the government would take steps to insure the safety of the Europeans in the region. Later came the announcement that the troubles at Fez had become so serious that the government had prepared for measures to restore order in the region, and had entered into communication with the other powers on

the subject. The Spanish government declared that Spain would coöperate with France in the spirit of existing treaties. Then followed the French military expedition to Fez, with all the resulting complications, which will be found described in the article MOROCCO.

OTHER FOREIGN AFFAIRS. Both M. Pichon and his successor in foreign affairs, M. Cruppi, insisted that the foreign policy of France should be one of energy and decision. A strong army and navy was held to be indispensable if France was to hold the place to which she was entitled in international affairs. In an address on April 7, the foreign secretary, in order to allay the fears in regard to the effect of the Potsdam convention on the Franco-Russian Alliance, declared that that alliance was unimpaired and continued to be the basis of French policy. He said further that the *entente cordiale* with Great Britain also continued firm, that relations with Spain were as heretofore friendly, and that in regard to Turkey, the French government continued to view with sympathy the liberal institutions of the new régime. Later, however, strong feeling developed against Spain for her course in sending an expedition to Alcázar (see MOROCCO, paragraphs on *History*). The course of events during the Moroccan negotiations tended to maintain the good feeling between France and Great Britain, which continued unabated throughout the year. On August 19 a new commercial and navigation agreement between France and Japan was signed in Paris. By this France agreed to apply her minimum tariff to Japanese products, and Japan conceded tariff reduction on fifteen of the chief French exports.

THE FALL OF THE BRIAND MINISTRY. The Chambers reopened on January 10, and from that date to the fall of the ministry on February 27 a large part of the time of the deputies was taken up in the discussion of the budget. The important measures before Parliament, according to M. Briand, were, defense of the lay schools, the statute of functionaries, measures of social progress and social safety, and the naval programme. He urged that the budget discussion be as brief as possible in order to take up these matters. Important debates took place on the foreign policy of the government, especially as regards the Potsdam meeting and Morocco, on the status of syndicalism, on the wine growers' riots, and other matters which will be referred to in later paragraphs. In January and February the Chamber discussed and voted important sections of the budget, including in the railway budget a provision for financial regulation of railways under separate administration, subject to the direct authority of the ministry. On February 6 the Chamber voted a bill guaranteeing the origin of the wines of Champagne, which was carried in the Senate on February 10. The introduction of a bill by M. Delcassé on February 21, providing for two additional dreadnoughts of 23,500 tons each, led to a discussion in the course of which the Socialists demanded that the government take the initiative in bringing about an international agreement for disarmament, to which the foreign secretary, M. Pichon, replied that although such efforts had been fruitless in the past, the government would accept the proposal of another deputy who had asked it to do its best toward making disarmament a practical question at The Hague Conference. It was soon evident that

JOSEPH CAILLAUX

TWO FRENCH PREMIERS OF 1911

the government was losing its hold on the majority, especially as regards the religious question. It had been repeatedly attacked on the one hand by the Right for its course in the church difficulties, and on the other hand was attacked by the Radical Socialists for laxity in enforcing the church laws of 1901 and 1904. The Extreme Left were, moreover, resentful of its vigorous action in putting down the great railway strike of 1910. In a debate on the congregations on February 25, M. Malvy, leader of the Radical Socialists, accused the government of remissness as to the church laws, and the vote of confidence gave a majority of only sixteen to the ministry. On this revelation of its weakness, the ministry resigned (February 27), the premier addressing a letter to the president saying that, though the government was assured of a majority, it had met with a systematic opposition which prevented it from carrying out its programme of church legislation and social reform. During the session an attempt had been made to assassinate M. Briand in the Chamber. At the evening session of January 17, the assailant, named Jizolme, fired two shots, one of which passed very near the premier. The assassin was arrested, and on appearance in court was examined by alienists and declared to be mentally unbalanced. The Senate unanimously passed a resolution of sympathy for M. Briand and congratulation on his escape.

THE NEW MINISTRY. M. Monis was charged with the formation of the cabinet. The premier took for himself the portfolio of the interior, and chose his colleagues all from the Radical bloc: M. Perrier, justice; M. Cruppi, foreign affairs; M. Berteaux, war; M. Delcassé, navy; M. Caillaux, finance; M. Steeg, public instruction; M. Dumont, public works; M. Massé, commerce; M. Pams, agriculture; and M. Boncour, labor. M. Malvy, who had led in the attack on the preceding ministry, was made under secretary of justice and worship, thus giving the impression that the new government intended to take more drastic action on the church question. On March 6 M. Monis met the Chamber and outlined the government programme. It comprised such policies as would, he thought, be supported by the Republican majority. Its chief features were: Reform of the system of direct taxes; secondary technical and industrial education; credit for the small trade and industry; credit for the workmen; electoral reform based on the plan proposed by the commission. The income tax was to be the first measure before the Chamber. He urged that the work of Parliament be devoted to the following points in order: The budget, measures for suppressing sabotage on the railways; measures for making pensions retroactive and concerning collective contracts, and methods of conciliation and arbitration. As to the railway employees who had been dismissed for taking part in the strikes of 1910, he announced that in the interest of industrial peace the state railroads would restore them to employment and that the other companies would be asked to do the same, but no man would be reinstated who had been convicted of an act of violence. He promised that the law of workmen's pensions should go into effect on July 3, 1911, and that the government would apply, without violence on the one hand or laxity on the other, the laws concerning the congregations, the separation of the church and state, and the lay schools. He assured the

Chamber that the government would proceed to the reform of the justices of the peace. As to foreign affairs, the government promised to continue the policy of its predecessor. A vote of confidence was taken and carried by 309 to 114.

On the whole, the new cabinet tended toward the Left of the Radical party. The change that attracted the most attention was the appointment of M. Cruppi as foreign minister, in place of M. Pichon. The latter had administered the office of foreign affairs since October, 1906, and it seemed unfortunate that the foreign policy of France should be entrusted to new hands. The chief credit of M. Pichon's administration was his discreet method of negotiating with Germany, concerning Morocco, which had resulted in giving France a free hand and relieving her from embarrassment. Latterly he had been criticised for the consequences of the Potsdam interview, concerning which an account is given in a separate paragraph. The portfolio was offered to and refused by three men in turn before it was finally accepted by M. Cruppi. The difficulties before the new foreign secretary were very serious, and the public looked forward to his course with some apprehension. Another important feature of the new cabinet was the inclusion of M. Delcassé as minister of marine. This indicated that the latter's policy as regards the naval programme had completely triumphed.

The bill authorizing the laying down of the two dreadnoughts in 1911 was passed on March 7. In the following week all the clauses of the navy budget were voted. On March 15 M. Monis declared before the commission on universal suffrage that he favored the principle of *scrutin de liste* and of proportional representation, with certain reservations, and urged that Parliament take up the matter as soon as the budget was out of the way. On March 20 the bill for retroactive pensions among railway employees was passed after some sharp criticism on the ground that it laid too heavy a burden on the railway companies. The new ministry was soon called into question as to its attitude toward the religious schools: Early in April a deputy inquired into the failure of the government to apply the separation laws to certain schools in the department of Gironde. After explaining the matter the government received a vote of confidence in its intention to carry out with firmness the policy of secularizing the schools.

THE DISTURBANCES IN THE WINE-GROWING DISTRICTS. On January 11, a mob broke into the cellars of some wine merchants at Haut-villiers, and destroyed thousands of gallons of champagne, and other disturbances followed during the month. To meet the champagne issue a bill was introduced for the protection of the champagne and on February 6 the main clauses were adopted by the Chamber of Deputies. The general effect of the law was to distinguish between the high grade of native wine and other products not strictly local, but hitherto classed as champagne. It delimited the champagne district according to the demands of wine-growers in the region about Rheims and Epernay. During March disturbances occurred in the Aube district among wine-growers who resented the government's refusal to include their region within the "delimited" champagne area; and in the latter part of the month turbulent mobs of vineyard laborers came into collision with the police. In Parliament resolutions and motions were offered concerning the

abrogation of the law of 1908, delimiting the wine-growing regions and the amendment or suspension of the Adulteration law of 1905; and on April 11 the Senate voted to abolish the territorial delimitation. Thereupon counter-demonstrations were made against the Aubeois in the Marne region. Great quantities of wine were destroyed and a number of houses were burned. It was necessary to send government troops into the district. In the suburbs of Epernay 12,000 vine dressers swarmed over the vineyards and broke down the vines, destroying completely some of the plantations. They then invaded the storehouses and destroyed their contents. Early in May the troops in the champagne district reached the number of 12,000. The Council of State decided to distinguish the wines of Marne from those into which grape juice from other regions entered. Announcement of this decision, early in June, led to a revival of the agitation in the Aube district, where processions and bonfires were held and where mobs assembled and had to be dispersed by the soldiers. Appeal was made by the malcontents to Parliament. Soon rumors were afloat that the cabinet could not hold out, and on June 14, at a meeting of the Socialistic Radical party, the opinion was expressed that the cabinet would have to resign, the government being thought unable to prepare an adequate defense in the coming debate on the champagne question. A number of arrests were made after the champagne riots of April, and the prisoners came up for trial in the middle of August. Of the thirty-three who were accused, twenty-seven were acquitted and six condemned to varying sentences, the longest being four years and the shortest one month.

THE FALL OF THE MONIS MINISTRY. On May 2 M. Berteaux, the minister of war, was killed, and the premier, M. Monis, was injured by the flight of an aeroplane, as the competitors in the Madrid-Paris aviation race were starting at Issy-les-Moulineaux. M. Berteaux's death was a serious loss to the cabinet. It was believed that his choice as a member of the ministry was the reason why it had been formed so easily and quickly, and he was regarded as the strongest of the ministers. He had been especially energetic and skillful in equipping troops and organizing the campaign in Morocco. During the spring and early summer the disturbances in the wine-growing district continued and there was much discussion of the subject in Parliament. As it went on, it became evident that the government was losing its supporters on the champagne question. It was further weakened by the hostility of a large number of the ministerial majority to the Electoral Reform bill, which sought to introduce the *scrutin de liste*, with proportional representation. The final crisis occurred, however, in connection with an altogether different question, namely, that concerning the command of the army in time of war. The government desired the appointment of a generalissimo over all the French armies, but this was opposed by the Socialists and others as a measure of militarism. On June 30 the government was defeated on its motion by twenty-four votes and tendered its resignation. A new cabinet was formed under M. Caillaux as premier. He also held the portfolio of the interior. M. Delcassé continued in the new government as minister of marine.

THE DISMISSED RAILWAY EMPLOYEES. A large

number of employees were dismissed for participating in the great railway strike of 1910. There was a strong public opinion in favor of clemency toward the dismissed railway men, and it was urged that they should be reinstated. Early in the year the ministry declared that it would try to have the men reinstated. A number of them were reemployed on the Western Railway and the company declared that there had been no relaxation of discipline or falling off in the quality of the work or any other bad result from their reinstatement. Nevertheless the government's efforts to secure the reemployment of the strikers were not successful and the Socialists, who had made this their chief demand, were driven to desperation toward the close of the session at the thought of facing their constituents without having gained this end. Early in July a riot occurred in the Chamber in the course of a violent attack upon the premier by several Socialist deputies for the government's course in regard to the railway strikers. M. Caillaux declared that he would act as far in the direction of humanity as was consistent with the public interests, but would not yield to pressure. A fracas took place between the Socialists and the Radicals and the sitting was adjourned.

THE TOULON DISASTER. At six o'clock on the morning of September 25, the French battleship *Liberté*, a vessel of 14,660 tons, was blown up in the harbor of Toulon, causing the death of 226 officers and men and wounding 184. The accident was thought to be due to a short circuit or to spontaneous combustion in the magazines. A muffled explosion was heard at about half-past five, soon followed by three others. Wreckage of all kinds was hurled into the water, the vessel was broken in two and sank. A controversy immediately began as to the causes of the disaster, and a court of inquiry was appointed to investigate it. The *Liberté* was built under the programme of 1900, and was a sister vessel of the *Patrie*, *Democratie*, and *Justice*. The commission of inquiry reported the latter part of October that it discovered no sign of foul play or incendiarism, but believed that the disaster began with the ignition of a cartridge in one of the magazines. It found that the requirements as to the keeping of powder were duly observed, but recommended improvements.

FOOD RIOTS. The rise in the price of food caused serious disturbances in northern France during the last week of August and the first week of September. The General Federation of Labor was active in exciting the crowds by incendiary speeches, and M. Yvetot took an active part in stirring up the discontent. The rise in price for the necessities of life, though general throughout the world, was especially marked in France owing to the seasons of drought. The movement began with a boycott on the part of thousands of housewives of the local markets in the towns of northern France. In spite of the physical causes of the rise in the price of food, a campaign was waged against the produce brokers. For many months the Socialists and revolutionary agitators had laid the blame for the rise in price on these middlemen. The General Confederation of Labor had made it its policy to cry out against dear food and high rents. The speeches of M. Yvetot added to the excitement in the disturbed region. Bands of women and members of the unemployed and dis-

orderly element in the towns gathered, and in some cases plundered the shops. A council of the ministers was held on the subject and it was decided to allow the communes to take part in coöperative butchers' and bakers' establishments with a view to regulating the supply of the necessities of life. A scheme was also approved for the provision of cheap housing. Certain other measures were adopted for relief, for example, steps to promote the importation of colonial cattle, the revision of the embargo on foreign cattle, and the suspension of duties on cattle feed. A commission was appointed to inquire into the question of high food prices and lay the report before the council. The report was submitted on September 7. It attributed the peculiar conditions in France to the drought and to the failure of crops, although it found that the high food prices were a general phenomenon. The council decided upon the measures for importing more cattle, above mentioned, and in addition on certain other plans of relief. The General Confederation of Labor now turned its attention to Paris and began an agitation for lower rents. For a time there was fear of a general strike on behalf of rent-payers.

THE BUDGET. The 1911 budget was voted by both houses of Parliament on July 12. In the Chamber the vote was 458 to 88. Its new features were: First, national, provision for developing the navy and strengthening the frontier defenses; second, industrial, concerning the financial and administrative status of the state railways; and third, social, providing for the service of the new Workmen's Pension law, which came into effect in June. The budget draft for 1912, submitted to the council of ministers in September, showed a considerable increase over the previous year, of which the greater part was due to social legislation and to the requirements of national defense. To meet the deficit there was to be a duty on gas and electric light, a readjustment of the hall-mark duty on precious metals, a 5 per cent. tax on Bourse transactions, and the repayment by the Eastern Railway of a larger part advanced by the state.

COLONIAL ADMINISTRATION. In a debate on the estimates for the colonies, the bureaucratic administration was denounced and an increased decentralization was demanded. The minister for the colonies, admitting that some of the charges were well founded, proposed a plan of reform especially in the judicial administration. Among its features was the requirement that the French colonial officials should have a working knowledge of the language of each country. Several features of the colonial administration were strongly condemned. Among other charges it was said that money was being shamefully wasted and that the ministry for the colonies was negligent in its supervision, that a fourth of the officials could readily be spared, and that a confused irrational system of financial control prevailed.

OTHER FEATURES OF THE YEAR. During 1911 instances of sabotage were very numerous, especially on the railways, where many attempts were made to destroy trains and blow up buildings. In March a new Liberal group was formed under the title the Republican Union by some forty of the Progressives and a few deserters from the Democratic Left. Its programme was to be the development of public

liberties and the promoting of social reforms. M. Leblond was named as the chief of the new party. In June, M. Duez, who had been conspicuously before the public in 1910 for misappropriation of funds as liquidator of the religious orders, was found guilty of embezzlement and sentenced to twelve years' penal servitude. A change in the military administration was announced at the beginning of August. The command of the principal groups of armies in case of war was in future vested in an officer to be styled the chief of the general staff of the army, and the office of vice-president of the army council, which had hitherto carried with it the command, was abolished. The general purpose of this change was to secure a greater degree of unity in the command. General Joffre became the new chief of staff. The programme announced by the navy committee toward the end of August indicated in general the purpose to restore to France her position as the world's second greater sea-power. It provided for an effective fleet, which should be ready in 1920, of 28 battleships of the larger class, 10 scout cruisers, 52 ocean-going torpedo boats, 94 submarines, and 10 vessels for oversea service. For an account of the May Day demonstrations see **SOCIALISM**. Pursuant to a law passed by the Senate on February 10, Greenwich time was adopted for France and Algeria at midnight, March 10-11. In July President Fallières visited Amsterdam at the invitation of the queen of the Netherlands. A general arbitration treaty between France and the United States was signed at Washington on August 2, and was awaiting the action of the Senate toward the close of the year. (See **UNITED STATES**, and **ARBITRATION**, **INTERNATIONAL**.) In November a bill was introduced for the placing of the great concessionaire railway companies under more direct government control, and providing for more complete regulation of the administration of their personnel. The officers of the railway companies protested, saying that if the proposals were carried out they would urge rather the taking over of the railways by the state altogether.

FRANCE (SHIP). See **BATTLESHIPS**.

FRANCO-RUSSIAN ALLIANCE. See **FRANCE**.

FRANCIS, CHARLES SPENCER. An American public official, former ambassador to Austria-Hungary, died December 1, 1911. He was born in Troy, N. Y., in 1853 and graduated from Cornell University in 1877. He entered the printing office of the *Troy Times*, of which his father was founder and owner. After serving as city editor and managing editor, he became, on the death of his father in 1897, sole owner and editor of this paper. His diplomatic service began as secretary to his father, who for three years was United States ambassador to Greece. From 1900 to 1902 he was minister to Greece, Rumania, and Serbia, and from 1906 to 1910 was ambassador to Austria-Hungary. He was an officer and director in many financial institutions and was twice elected by the legislature regent of the University of New York. He was vice-president of the New York Society for the Preservation of Science and Historic Places and Objects. He was a member of several patriotic societies.

FRASER, Mrs. HUGH. See **LITERATURE**.

ENGLISH AND AMERICAN, General Biography.

FREE BAPTISTS. See **BAPTISTS**, **FREE**.

FREEMAN, JOHN CHARLES. An American scholar and educator, died April 10, 1911. He was born at Lisle, N. Y., in 1842 and graduated from the University of Michigan, in 1860. He served throughout the Civil War and in 1868 became assistant professor of Greek in the University of Chicago. He remained in this position until 1874 when he became professor of Latin in the same university. From 1879 until the time of his death he was professor of English in the University of Wisconsin. In 1900, he was United States consul at Copenhagen. He edited Xenophon's *Memorabilia* and the *Dialogues of Lucian* and was the author of a *History of American Literature*. He contributed articles on commerce and finance to the United States Consular Reports and on literature and politics to various magazines and journals. He was well known as a speaker on political and lyceum platforms.

FRÉMONT, JOHN CHARLES. A rear-admiral of the United States navy, died March 7, 1911. He was born in San Francisco in 1849, son of Maj.-Gen. John C. Frémont, the noted explorer and soldier. He graduated from the United States Naval Academy in 1872 and carried on post-graduate studies in torpedoes, electric science and ordnance. He was promoted through various grades to the rank of captain in 1906. He commanded the torpedo boat *Porter* in the Spanish-American War and was commandant of the Cavite Navy Yard, 1899 to 1901. In 1906-7 he was naval attaché in Paris and St. Petersburg. In 1908-9, he commanded the *Mississippi*. He was the author of *Government Reports on Deep Sea Soundings, Searchlights and Coast Survey*. He contributed articles to newspapers and magazines.

FRENCH EQUATORIAL AFRICA. Till 1910 known as the FRENCH CONGO. A French possession on the west coast of equatorial Africa, composed of three colonies: The Gabun Colony (120,745 sq. miles; 4,000,000 inhabitants; capital, Libreville), the Middle Congo Colony (170,255 sq. miles; 3,000,000 inhabitants; capital, Brazzaville), and the Ubangi-Shari-Chad Colony (Ubangi-Shari 154,400, Chad 223,800 sq. miles; population, 2,000,000 and 1,000,000; capital, Fort-de-Possel). Total: 669,280 sq. miles, 10,000,000 inhabitants, chiefly negroes. There are mission schools. The forests contain valuable timber, and rubber is exported. Chalcosite is mined at Mindouli; gold, copper, and iron are present. Imports (1909), 11,119,000; exports, 17,454,000. Vessels entered (1909), 72, of 147,000 tons. Ports, Loango and Libreville. A railway from Libreville to the Congo is projected. Telegraph lines, 870 miles. The general budget balanced in 1910 at 6,137,000 francs (state subvention, 600,000 francs). Debt, 1,333,000 francs. The administrator-in-chief of the Middle Congo and the lieutenant-governors of the other colonies are under the direction of the commissioner-general (1911, M. Merlin), with headquarters at Brazzaville.

KANEM (Capital, Maô), northeast of Lake Chad, is a district of the Shari region. **WADAI** (170,000 sq. miles; 2,000,000 inhabitants; capital, Abeshr), east of Kanem, is a French protectorate.

For territorial changes resulting from the Moroccan treaties of 1911, see MOROCCO. An encounter was reported on January 12 between the Senussi Sultan and French troops at Tata,

in which the latter defeated the enemy with a loss of 300 and lost eight men themselves. On June 23 Colonel Largenau, in command of the forces in the Chad region, entered Abeshr and established there a fortified post.

FRENCH ESTABLISHMENTS IN OCEANIA. A number of widely scattered islands and groups of islands in the southern Pacific; a French colony. Total estimated area, 1520 sq. miles; population, 30,563 (Polynesians, 26,994. They include the Marquesas, Tuamotu, Leeward, Gambier, and Tubuai Islands. Copra, vanilla, mother-of-pearl, raw cotton, cocoanuts, etc., are the chief products. Imports (1909), 4,612,930 francs; exports, 5,051,442. The United States furnished imports and received exports valued at 2,093,000 and 2,854,000 francs respectively. Vessels entered, 51 of 87,338 tons. Revenue and expenditure (1909), 2,410,626 and 2,213,645 francs respectively; subvention, 150,000. Governor (1911), Adrien Bonhoure.

FRENCH GUIANA, or CAYENNE. A French colony and penal settlement on the northeast coast of South America. Area, 34,061 sq. miles; population (1906), 39,349. Chief town and sole seaport, Cayenne, with 12,426 inhabitants. Penal population (1909), 4465 transported and undergoing reclusion; 2492 relégués; 1327 freed. Primary schools, 26, with 2614 pupils. Agriculture is undeveloped; the products are rice, corn, manioc, cacao, coffee, sugar-cane, indigo, tobacco, and gutta-percha. Placer gold-mining is the chief industry; production (1909), 127,416 oz. Export of gold (1909), 10,767,664 francs. Imports (1910), 12,213,420 francs; exports, 11,567,168. Vessels entered (1909), 225, of 55,096 tons. The local budget balanced (1910) at 3,407,000 francs. French expenditure (budget of 1911), 6,151,142 francs (5,884,000 for the penal settlement). Debt, 76,000 francs. Governor (1911), F. E. Leveque.

FRENCH GUINEA. A French colony in French West Africa (q. v.). Area, 254,020 sq. kilometres (98,077 sq. miles). Recently estimated population 1,702,957 (942 French). Capital, Konakry, with (1909) 6583 inhabitants. There were in 1909 26 official schools, with 1922 pupils; 10 private, with 278; 3902 Mussulman, with 23,777. The main products, with export values in 1909, are given as follows: Rubber, 15,384,745 francs; live animals, 1,201,315; hides, 834,765; palm kernels, 752,538; copal, 371,858; peanuts, 207,661. Total imports and exports (1909), 22,920,523 and 19,368,641 francs respectively. The Konakry-to-Niger Railway completed 94 kilometers during 1909, making the total length (December 31, 1909) 431 kilometers. Telegraph lines, 2820 kilometers; telephone, 75. Number of post and telegraph offices, 32. Revenue in 1909, 7,504,745 francs; expenditure, 6,756,115. The colony is administered by a lieutenant-governor (1911, V. T. Liotard), under the direction of the governor-general of French West Africa.

FRENCH HISTORIES. See FRENCH LITERATURE.

FRENCH INDIA. The French possessions in India consist of five separate dependencies (aggregate area, 198 sq. miles; population, 277,723). The towns are Pondichéry (the capital), Karikal, Mahé, Chandernagar, and Yanaon. Birth-rate (Pondichéry) in 1909, 37.79, death-rate 35.13 per 1000. Schools (1909), 51 primary and four colleges, with 280 teachers and 5240 pupils. Imports (1909), 9,543,000 francs

(raw cotton, seeds, and pulse); exports, 30,331,288 (cotton goods, ground nuts, oil-cakes). Vessels entered (1909), 374, of 747,629 tons; cleared 360, of 749,755 tons. Railways open (1911), 30 kilometers. The local budget (1911) balanced at 1,701,000 rupees; French expenditure, 192,000 francs. Debt, 795,963 francs. Governor (1911), P. I. A. Duprat.

FRENCH INDO-CHINA. A French dependency in southeastern Asia, made up of five states: Annam, Cambodia, Cochinchina, Tongking, and Taos (qq. v.). Aggregate area, about 309,979 sq. miles; population (1906), 16,315,063, chiefly Annamites. Capital, Hanoi (103,238 inhabitants), in Tongking. Rice, corn, pepper, silk, cotton, tea, sugar, rubber, and tobacco are grown. Mining products are coal and lignite, zinc, antimony, tin, wolfram, and gold.

Total imports (1910), 238,686,000 francs; exports, 290,547,000. Principal articles of export (1910): Rice, 106,867,000 francs; tin, 22,670,000; fish, 11,830,000; corn, 10,114,000; cotton yarn, 9,459,000; hides, 7,931,000; pepper, 3,745,000. Vessels entered (1908), 2073, of 2,110,141 tons; cleared, 1971, of 2,104,014. Railways open, 1756 kilometers (including 467 kil. in the Chinese province of Yunnan); telegraph lines 14,086 kil., wires 24,434; offices, 357. Telephone lines 524 kil., wires 3672. Post offices, 303. There are budgets for the separate states, and a common budget for Indo-China. The common budget (1911) balanced at 57,507,496 piasters. Governor-general (1911), A. Sarraut. KWANG-CHOW-WAN (q. v.) is under the governor-general of French Indo-China.

FRENCH LITERATURE. None of the recognized great French authors produced anything in 1911; one generation seems about to yield before another; again, none of the new names towers very high; the author of *Marie Claire* appears more and more as a shooting star. While the craze for memoirs seems to be, momentarily at least, on the decrease, poetry keeps on flourishing. As to novels, one may note an attempt at shifting the centre of gravity from love to all sorts of other preoccupations.

THE THEATRE. For detailed account we refer the reader as usual to the article **DRAMA**; but it is all the more imperative to devote a few words to this subject here as so many of the interesting literary events of the year centre around the stage. Authors still like to use the stage as a pulpit, and early in the year two authors picked out exactly the same plot in order to preach two directly opposed theories, and thus aroused a good deal of interest. In both plays a politician, chief magistrate of the town, has a son guilty of extremely grave misconduct. Is this father going to hand over his son to the tribunals, or shall his feelings as a father conquer those of the magistrate? Bourget, in *Le tribunal*, blames, in a father who yields to his parental love, the modern spirit of individualism; Paul-Hyacinthe Loyson (the son of the famous preacher) in *L'apôtre*, praises in the father, who himself discloses the guilt of the son and then resigns his position, the same modern spirit of individualism, which, according to him, is bound to inspire such highly moral actions. E. Fabre, so successful a few years ago with his *Ventres d'or*, has tried to put on the stage the colonial problem, and did so in a more interesting than convincing fashion. The psychological drama remains in honor with three of the acknowledged leaders of the

French stage today: Porto-Riche earned a solid success with his *Vieil homme*; Lavedan, another, with *Le goût du vice*; as to Bernstein, his *Après moi* was highly spoken of by men of letters, but had only a short run on account of personal prejudices against the author, a Semite who had incurred the wrath of the "nationalists" by his attitude toward France some years ago; the *Camelots du roi* (a sort of nickname of the royalists or nationalists) objected to his drama being played on the national stage of the Théâtre Français, *L'oiseau bleu* had not in Paris the same success it had enjoyed in America (where it was produced in the translation before being staged in the original French). Madame Rostand and her son, Maurice, made a play, *Un bon petit diable*, out of one of the children's books by Madame de Ségur; it was presented at Christmas time before *le tout Paris*. Maupassant's *Musotte* (three acts) was tried with some success and *David Copperfield* had a long run—it was, in a way, the part France took in the celebration of Dickens's centenary. Gémier (the famous director of the Théâtre Antoine) made a summer tour in France with his players, the "Théâtre National Ambulant" in an immense tent, with most elaborate scenery, taken from town to town in motor cars. J. Rouché, the director of the Théâtre des Arts, endeavored to reform staging and do away with the fad for grand and elaborate scenery which distracts the spectator's attention from the play. The play, *Les frères Karamazov*, adapted from Dostoyevski, was the great success of the season. Rouché's undertaking reminds one of similar attempts in Munich and Moscow.

POETRY. The production of poetry has not increased, but the attention paid to poets by the public has. The international inquiry on the *Vers libres* by the review *Poesia* in Milan, to which we referred in last year's article, has started the discussion afresh between conservatives or classicists and progressives or advocates of freedom in rhythm. The reaction against the freedom of the Symbolists was voiced by a review *Le loup, journal d'action d'art*; the contributors call themselves *les loups*, while their opponents are called *les lions*. The discussion at one time became so hot that both parties had to appear in court after blows had been exchanged. Ultra-modernism inspired a little treatise called *La poésie paroxyste* (by H. Maassen), a title which needs no further definition. A scientific basis for poetical expression was sought by Duhamel et Vildrac, *Notes sur la technique poétique*; and Robert de Souza in *Du rythme en français* claims for his ideas which have been expressed before, and which are moderately progressive, the support of Abbé Rousselot, in his famous studies on experimental phonetics. An interesting study on modern poetry was published in *La Revue*, 1 and 15 December, and Tancrède de Visan, in a book, *L'attitude du lyrisme contemporain*, tries to establish a connection between the more famous modern lyrists and recent philosophers, Bergson, of course, the man in fashion, among others. As to the original works, we must mention first of all a new and enlarged edition of Rostand's *Les Musardises* (very interesting as it shows the first ideas of some of the later dramas); then, among the noted poets: Regnier's *Miroir des heures*; Francis James, Vols. I. and II. of *Les Géorgiques chrétiennes*; Verhaeren, *Les*

plaines—in the series *Toute la Flandres*—all in their usual style. Sébastien Ch. Leconte's two volumes, *L'esprit qui passe* and *Le masque de fer*, were much appreciated; he has an inspiration in thought and expression reminding us much of Hugo, Leconte de Lisle, and Hérédia. Among the poets of the younger generation are Rolmer, *Chants perdus* (2e. vol.); Beaudouin, *Les deux règnes*; Vildrac, *Le livre d'amour*; Duhamel, *L'homme en tête*, Parmentier, *Par les routes humaines*. A favorite poet is Spiess, who published in 1911 *Chansons captives*. A dramatic poem in three acts, *Le cœur de Timandre*, by J. Reyne (a love of Alcibiades) and *Les suppliants* by F. Porché, of classical Greek inspiration, too, did not pass unnoticed. It is difficult to make a selection among women poets. Lucie Delarue Madrus, in *Par vents et marées*, is still a great poetess but adds no new note to her lyre; we might further quote Jeanne P. Vaissière's *Et la lumière fut* (optimistic), and Marguerite H. Rosier's *Belle qui passe*. A posthumous volume by the excellent poet Rollinat, *Les bêtes*, and another volume of Van-Bever's *Poètes du terroir* also came out.

NOVELS. To classify the innumerable novels is never an easy task. Let us first mention some which have attracted attention particularly. Marguerite Audoux's *Marie-Claire* owes surely part of its success to the fact that it was heralded by O. Mirbeau who had "discovered" Maeterlinck some twenty years ago. People had faith in his judgment. The autobiography of the author, a poor provincial girl, is told in a style concealing so much art behind its apparent simplicity and straightforwardness that many suspect the famous critic of having "corrected" the story before it appeared in book form. E. Faguet also thought he had discovered a literary genius, Emile Clermont, author of *Amour promis*; a resurrection of the romantic novel in the style of René Adolphe, or Oberman, i. e., people rendering their lives miserable by analyzing their love, understanding that autopsychology is bad, yet not resisting the temptation, and trying to love anyway and not succeeding, ending with suicide. André Gide, who had acquired his fame by writing stories of that class, issued this year *Isabelle*, a weird story of a man falling in love with a portrait in an old castle; the original of the portrait, hidden by her parents because of her sinful life, appears to the hero who thinks he sees a spectre. Maurice Maindron published another of his fine sarcastic stories, the delight of cultured readers; *Le bon Monsieur de Veraguez* is a leader in the religious wars of the sixteenth century, with no honor in the ordinary sense of the word, betraying the Protestant or the Catholic cause according to circumstances, extremely cruel, aiming at a gay life, but always acting with the most exquisite manners and tact. Romain Rolland issued another volume in the *Jean-Christophe* series (see preceding YEAB BOOKS) which was translated into English under the title of *Jean Christophe in Paris*. Ch. Morice created quite a stir with his *Il est ressuscité*; he supposes Christ coming to Paris today, and after he has aroused some interest, thanks to newspaper men, the city continues its usual life undisturbed. It is the *If Christ came to Chicago* for Paris. Another writer, E. Bauman, in *La fossiles*. A. Beaunier, in *L'homme qui a perdu* our epoch is in a bad way, and return to

Catholicism the only remedy. His pictures of the Sons of the Revolution, rotten morally and socially, have reminded some of Curel's *Les fossiles*. A. Beaunier, in *L'homme qui a perdu son moi* tells the story of a man who lost himself in science and inventions and comes back to religious faith as a basis for life.

Among the novels relating purely and simply to love-stories, the following ought perhaps to be especially remembered: E. Jaloux, already well known by previous novels, tries once more in *Eventail de crêpe* to apply the Balzacian method, to inspire himself altogether and exclusively from real life; J. Reibrach in *La maison du bonheur* tells the gloomy story of a woman who is not ill intentioned and who suffers for what she is doing when her appearance wrecks the happiness of a home; A. Boucinet, *L'amour qui dure*, the only lasting love is conjugal love; Guy Chantepleure, in *Le hasard et l'amour* shows how love that was born by chance develops at times into a solid and happy union. *Fermina Marguez*, by Valéry Larbaud, deals with children in a boarding school who all feel the early attraction toward the other sex; one day the girl who gives the title to the book passes among them; she is the sister of one of the pupils; and the various expressions of love, according to the various natures of the boys, have been much admired, Francis de Miomandre in *L'ingenu* tells in his skeptical and light vein the story of a young man without aim in life, who loves various women at haphazard and for all sorts of reasons, finally finding one that will mean real happiness to him (the idea of Flaubert's *Education sentimentale*); René Vincent, in *Les amours imaginaires*, mocks the artificial way of loving in people trying to imitate novel-heroes. Two authors were tempted by the analysis of the feelings of the sick, Louis de Robert, whose *Roman du malade* was rewarded with the "Prix de la vie heureuse," pictures the sufferings of a young invalid; he finds comfort in the company of a charming and cheerful girl, but sees that she loves another, and then he buries within himself his sorrow. Louis Lefebvre in *La maison vide* makes up another case; a man, married and a father is told that his days are numbered; a cancer is making rapid progress; after a hard struggle he conquers himself and uses in a beautiful effort every minute that is left him to inspire courage and love in his two beloved ones. There is a long series of novels depicting provincial life, more even than last year. The most widely discussed probably is *La maîtresse servante* by Jérôme and Jean Tharaud; a young "hobereau" from Limousin, who has been studying in Paris, brings home his mistress to marry her; the mother manages the situation very delicately, and makes the girl her servant; the son gets tired of her, marries elsewhere, while the girl is taken care of by the mother. About the same idea, picture of the life of former nobility in the provinces—only here we are in Brittany—inspires A. de Chateaubriant; his *M. des Lourdines* got the Prix Goncourt this year. A third provincial novel that was particularly successful is *Juste Lobel, Alsacien*, by A. Lichtenberger; the hero, an Alsatian living in Paris, boasts of humanitarian ideas and cosmopolitanism; later he yields to life and sees that he must throw overboard mere theories. We have not space enough to do more

than mention Le Braz, *Ames d'occident* (Brittany); Bodin, *Le pays des bandes fleuries* (Saintonge); Davignon, *L'Ardennaise*; Léon Lafage, *Par aventure* (which to tell the truth has a Parisian intrigue, but on a beautiful background of Provence); and Andrée et Jean Violli's *Puycerrampion*, which besides being a Provençal story, has a particularly picturesque and taking hero, and is written by husband and wife, thus making a new combination of authors than the one we are accustomed to of "brothers" Goncourt, Margueritte, Rosny, Tharaud, etc. A few novels, without being exactly provincial novels because the scenery is not in any special place or province, but which could be called peasant novels, are interesting, thus: G. Maurière, *La politique à Saint Genoul* (realistic and satirical); P. Harel, *Hobereaux et Villageois* (the artful but prosperous and gay peasant); E. Guillaumin, *Baptiste et sa femme* (the miseries of the peasant when trying to live the modern life of a city for which he is not made). The events in Morocco have inspired two colonial novels, e. g., P. Adam, *La ville inconnue*, and R. Randan, *Les Algériens*, both enthusiastic about the life of the colonizing soldier; the first attracted much attention owing to the fame of the author. Good exotic novels are e. g., P. Reboux, *La petite Papacoda*, very vivid picture of the Neapolitan life of a petit bourgeois; R. G. Charles, *Monsieur Charmeret en Italie* uses the form of novel to relieve the dryness of travel account; P. Adam, in his *Rail du Sauveur* tries an American novel where he shows combined the two opposite dispositions of business and mysticism; the idea is good but the author by a silly plot and story once more shows how superficially, after all, he has observed America. J. H. Rosny gives us a new sample of his suggestive and powerful prehistoric novels, *La guerre de feu, roman des âges farouches*. Finally, three novels by themselves: Louis Pergand, *La revanche au corbeau* sets himself the difficult task of suggesting the feelings of animals by merely describing their gestures and actions; no speech, as in La Fontaine or Kipling, is allowed (very well received); G. Appolinaire, *L'héréditaire et cie* a sample of pure fancy, in the style of Hoffman or Poe, but with much cynicism; Abel Hermant, *Les renards*, a witty but uncharitable diary of Paris, perhaps unworthy of a talented pen.

Few novels by women need be mentioned this year. Love, tragic, comic, light, graceful—but always love—is their theme, and of course love is old and nothing original can be expected. Madame Delarue Madrus publishes *Tout l'amour*; M. Tinayre, *La douceur de vivre* (two women are suffering here instead of one); of less famous names we quote: M. Chaumont, *L'éveil* (the awakening of love, of course); L. Château (the mother of M. Tinayre) *La ravageuse* (about the same subject as *La rabouilleuse* by Balzac; a woman disturbs the peace of the family); then agreeable and innocent stories by Lucie Gauthey, *Le destin nous conduit*, and Jeanne Schultz, *Cinq minutes d'arrêt* (the author of *La neuvième de Collette*). Special mention may be made, however, of C. Yver, *Le métier de roi*; Helen Vacaresco, *Le sortilège*, and Simone Bodève, *Sen mari*, reminds one of *Marie-Claire* (mentioned among the famous novels of the year); it is also the story of petty miseries in life, all the tragedy being in the everyday

events. The style is nothing (in this it differs from *Marie-Claire*) and although very tragic, one questions whether it is art. Collections of short stories were published by Bourget, *L'envers du décor* (usual style of the author); J. Giraudoux, *L'école des indifférents* (many see in this author a new and promising style); C. Maclair, *Les Passionnés* (lovers of ideal); Ch. H. Hirsch, *Parfeu et Martin*. A valuable article by A. Charpentier, *La faillite du roman littéraire* (by which he means the novel of forty years ago, Goncourt, Zola, Daudet, etc.) in *La Grande Revue* is here recommended.

MEMOIRS AND HISTORY OF FRANCE. The mania for "mémoires" seems to have died out for a little while. Freycinet published his *Souvenirs de 1848-78*, and Jules Claretie his *Quarante ans après* (1870-1910). Among the historical works that ought to be mentioned, perhaps, are: Du Bled, *Société française du 16 au 20 siècle*, *Comédie de la société*, *Monde de l'émigration*; Loliée, *Talleyrand et la Société européenne*; and especially the *Jeanne d'Aro* by Hanotaux, which for its historic value and its deeply human qualities won general praise. The great work of Laviisse, *Histoire de France* was completed in 1911.

HISTORY OF LITERATURE AND CRITICISM. Works covering no special period: A. Thierry, *Les grandes mystifications littéraires*, mostly French mystification like Clotilde de Surville, Nodier, Mérimée; Bovet, *Lyrisme, épopée, drame*, an odd attempt to revive a law of evolution of the literary genres like the one sketched in Hugo's *Préface à Cromwell*. Works according to the subject arranged chronologically: Ch. V. Langlois, *La connaissance de la nature et du monde au moyen-âge* (extremely valuable); Söderhjelm, *La nouvelle française au 15ième siècle*; A. Lefrane has a remarkable "édition définitive" of Calvin's *Institution chrétienne*; Mario Schiff publishes a very curious *Made-moiselle de Gournay*, the spiritual daughter of Montaigne, and editor of the "Essays"; a course of lectures by Cherbuliez, *L'idéal romantique de 1610-1816*, has been published for the first time. Abbé J. Bonnet has discovered in Russia and published *Poèmes inédits de Racine*. A posthumous work by Brunetière, *Études sur le 18ième siècle* (Voltaire, Encyclopédistes, etc.); D. Mornet, *La nature au 18ième siècle*; Dide J. J. Rousseau, *le protestantisme et la révolution* (very bitter); a life of Rousseau by E. Faguet; interesting unknown letters of Rousseau, published by Godet and Boy de la Tour; J. Harmand has a valuable *Madame de Genlis*, and Gaschet, a *Jeunesse de P. L. Courier*; Vailant, *Gust. Nadaud et la chanson française*; M. Sourian, *Les idées morales de Madame de Staël*; Dumoulin, *Les ancêtres d'A. de Musset*. A special study on Chateaubriand: *La vie politique de Chateaubriand* by A. Cassagne. P. de Lacretelle, *Les origines et la jeunesse de Lamartine* (1790-1812), and L. Séché, *Les amitiés de Lamartine*, both making good use of the unpublished diary of the mother of the poet. P. Berret publishes a very scholarly *Le Moyen âge dans la légende des siècles*. Great interest was shown in *Souvenirs de Maupassant* by François Tassard, his valet de chambre. The *Mercure de France* has issued a painful but valuable book, *Les derniers jours de Verlaine*. Sully Prudhomme's *Lettres à une amie* (1865-1874) came out; the friend is Amiel's wife. Criticism of contemporary authors will be found in Seillières, *Mystiques*

de néoromantisme, and in Miomandre's *Figures d'aujourd'hui*.

VARIOUS EVENTS. Two of the poets who started the school of the "Parnassiens" died: Xavier de Ricard and Ernest d'Hervilly. Maindron the novelist's death must also be recorded. The centenary of Th. Gautier was celebrated by an unusual number of articles, unanimous in saying that full justice had not been rendered to the poet of *Emaux et Camées*. The French Academy lost during the year Henri Houssaye, the historian; the newly elected members were General Langlois, H. Roujon, Baron Denys Cochin, and H. de Régnier. Monuments were unveiled in honor of Verlaine, Servet, Madame de Sévigné, Bossuet, Bornier, etc. The Nobel prize for literature went to Maeterlinck; the Prix Goncourt to A. de Chateaubriant, that of "La Vie Heureuse" to Louis de Robert. The academy rewarded especially Peguy, the editor of *Les Cahiers de la Quinzaine*; and J. Bédier received the Prix Gaubert for his work on the *Chansons de gestes*.

Finally, the great discussion must be remembered which started among opponents and adherents of the so-called new methods in the French universities; the students complain that the dry-as-dust methods coming from Germany are imposed upon them, and want life and thought in high culture. This brought about a general debate on almost all the present programmes and of course the fate of Latin and Greek is once more doubtful. The relation of the early period of the struggle can be found in *Agathon*, *L'Esprit de la nouvelle Sorbonne*; after that reviews and newspapers must be consulted.

FRENCH PHILOLOGY. See **PHILOLOGY**, **MODERN**.

FRENCH POETRY See **FRENCH LITERATURE**.

FRENCH SOMALI COAST. A French protectorate on the Gulf of Aden. Area estimates vary from six to forty-six thousand sq. miles (Gotha estimate, 8000 sq. miles). Population, about 208,000 (Danakil and Somali races). Capital, Jibuti (about 11,000 inhabitants, of whom 500 Europeans). Imports and exports (chiefly in transit to and from Abyssinia) in 1909, 15,520,000 and 23,128,000 francs respectively. A railway (193 miles) extends from Jibuti into Abyssinia, of which eighty-one miles are in French Somali Coast. Steam vessels entered (1909) 223, of 445,322 tons; cleared 222, of 446,412 tons. The local budget (1910) balanced at 1,372,476 francs. French expenditure (1910), 561,500 francs. Governor (1911), M. Pascal.

FRENCH UNIVERSITIES. See **UNIVERSITIES AND COLLEGES**.

FRENCH WEST AFRICA. A French possession composed of the colonies of Senegal, French Guinea, the Ivory Coast, Dahomey, Upper Senegal and Niger; the territory of Mauritania, and the Military Territory of the Niger (qq. v.). Aggregate area, 3,449,590 sq. kilometers, or 1,330,887 sq. miles. Recently estimated population, 10,926,772; including 8057 French and 1070 other Europeans. Schools (government), 169, with 10,218 pupils; besides 37 private (2594 pupils) and 7316 Mussulman (54,386). Expenditure for instruction: 120,120 francs government, 926,856 francs from local budgets. The aggregate imports amounted in 1909 to 118,583,192 francs and the exports to

109,832,020. Exports of peanuts, 44,305,571 francs; rubber, 31,837,698; palm kernels, 10,263,815; palm oil, 9,344,000; gum arabic, 1,706,050; live animals, 1,677,841. Railways, 1682 kilometers. Revenue from general and local budgets in 1909 amounted to 20,524,943 francs, and expenditure to 50,021,706. France expended, mainly for military purposes, 15,007,237 francs in 1910 on French West Africa. Total of railway budgets: 7,546,608 francs receipts, 5,040,398 francs disbursements. Up to April 1, 1909, loans aggregating 135,000,000 francs were issued, of which the unpaid capital and interest amounted December 1, 1909, to 144,395,500 francs. Dakar, a fortified naval station in Senegal, is the residence of the governor-general (1911, W. Merlaud-Ponty).

FREY, FRIEDRICH HERMANN. A German lyric poet, better known under the pen-name Martin Greif, died April, 1911. He was born in 1839 at Speier and was educated at Munich. His power of expression, as well as the nobility of thought and sentiment expressed in his lyrics, entitled these to be ranked among the best modern productions of the kind in German. Among his best known productions are the drama *Hans Sachs*, which appeared under his own name, and the following, which were published under his pen-name; *Collected Poems* (1868); *Neue Lieder und Mären* (1902), and dramas, *Nero* (1877); *Mariano Faleri* (1879); *Konradin* (1889); *Francesca da Rimini* (1892); *Agnes Bernauer* (1894); *General York* (1899), and *Schiller's Demetrius* (1901).

FRIENDS, THE; or, THE SOCIETY OF FRIENDS, often called **QUAKERS**. A denomination of Christians which originated with the preaching of George Fox about 1647. There are four bodies in the United States, the so-called Orthodox, the Religious Society of Friends, to whom the name Hicksite is sometimes given by those outside the denomination, the Wilburite, and the Primitive. The difference between these bodies is chiefly in the matter of administration. The largest in point of numbers is the Orthodox, which in 1911 had 100,072 members, 830 churches, and 1302 ministers. This branch is strongest in the States of the middle West. In the United States it has fourteen yearly meetings, and in Canada, one. Thirteen of these meetings are combined in a federation known as the Five Years' Meeting. This body meets in Indianapolis in 1912. The Orthodox branch has twelve colleges under its control, the best known of which are Haverford College for men, Earlham College for men, and Bryn Mawr College for women.

The Religious Society of Friends had in 1911, 19,595 communicants, 211 churches, and 97 ministers. It has seven yearly meetings in the United States and Canada. The society has under its auspices Swarthmore College at Swarthmore, Pa. There are thirteen preparatory and twelve secondary schools in New York, New Jersey, Pennsylvania, Delaware, and Maryland. Its schools and colleges are all coeducational. The Religious Society of Friends carries on active philanthropic work, especially in the line of peace and temperance. The advancement committee, appointed by the general conference, maintains headquarters at 140 N. Fifteenth Street, Philadelphia. In 1910 this committee published *The Life and Labors of Elias Hicks*, which aroused public interest both in the United States and in England. In 1911 it

held a successful summer school at Swarthmore College and also at Richmond, Ind. During the year two yearly meetings, Baltimore and Philadelphia, have provided field secretaries for directing and inspiring the philanthropic work of the society. A weekly newspaper, the *Friends' Intelligencer*, is published in Philadelphia. The biennial general conference will meet at Chautauqua, N. Y., on August 28, 1912.

The Wilburite branch had in 1911 3880 communicants, 48 churches, and 47 ministers. It has seven yearly meetings, each of which is independent; relations between them are maintained by an annual exchange of epistles.

The Primitive body is very small, numbering in 1911 171 communicants, 8 churches, and 10 ministers.

FRUITS. See **HORTICULTURE.**

FRYE, WILLIAM PIERCE. United States senator from Maine, died August 8, 1911. He was born in Lewiston, Me., in 1831 and graduated from Bowdoin College in 1850. He studied law and was admitted to the bar, engaging in active practice. He took an active interest in politics and in 1861, 1862 and 1867 was a member of the State legislature. In 1866-7 he was mayor of Lewiston and from 1867 to 1869 was attorney-general of the State. In 1871 he was elected to the Forty-second Congress and continued to serve until 1881, when he was elected United States senator to succeed James G. Blaine. He was reelected for successive terms and he would have held his seat until 1913, had he lived. Senator Frye was one of the sturdiest figures in Congressional life in recent years. He was one of the few remaining members of Congress who, starting at the bottom of the political ladder, came up through the various promotions of politics to a seat in the House and graduated from that service into the Senate. In his early political career he was unusually active in politics. He was a very popular public speaker in Maine and throughout the country. In 1896 he was elected president pro tempore of the Senate. Six years later he was reelected to this office and again in 1907. He was practically Vice-President of the United States for six years, his first service beginning with the death of Vice-President Hobart and continuing until the close of President McKinley's first administration. Early in the extra session of 1911 Senator Frye, realizing his physical incapacity to preside over the session, resigned from his position as president pro tempore. As presiding officer, he was one of the fairest men who ever filled that office and was universally esteemed for his impartial rulings. Aside from his service in the House and in the Senate, his most notable public service was as a member of the Paris Peace Commission which negotiated the treaty that ended the Spanish-American War. He was a faithful and efficient worker in the Senate and as chairman of the committee on commerce had unusual opportunities for important services, which he invariably fulfilled. In his later years he was not active as a speaker in the Senate on account of age and ill health.

FYLES, FRANKLIN. An American playwright and dramatic critic, died July 4, 1911. He was born at Troy, N. Y., in 1847. He did news-

paper work as a reporter in Troy; in 1870 he removed to New York and secured a position on the *Sun*. For a time he did general newspaper work, but in 1885 became dramatic critic. In this position he remained until 1903. Although continuously employed in newspaper work he found time to write many plays, some of which proved popular successes. The best known of these was *The Girl I left behind Me*, which he wrote in collaboration with David Belasco, and which was produced for the first time in the Empire Theatre in New York, in 1893. His first play was *The Three Days*, produced in Philadelphia in 1876. Among other of his plays which were more or less popular were *Cumberland*, '61, produced in 1897; *Overlook*; *The Amanuensis*; *The Governor of Kentucky*; *A Ward of France*; *Kit Carson*; and *Drusa Wayne*. He wrote also many magazine articles on dramatic and other subjects. He was the author of a book entitled *The Theatre and its People*.

GALSWORTHY, JOHN. See **LITERATURE, ENGLISH AND AMERICAN, Fiction.**

GALTON, Sir FRANCIS. An English meteorologist, anthropologist and traveler, died January 17, 1911. He was born at Duddeston, Warwickshire, in 1822. His father was a Birmingham banker and his mother a daughter of Erasmus Darwin. He was, therefore, a cousin of Charles Darwin. He studied medicine at the Birmingham College Hospital and at King's College, London, and in 1840 entered Trinity College, Cambridge. On leaving Cambridge he devoted himself for several years to sport and travel. In 1845-6 he made a journey into the Sudan and in 1850-52 spent two years in Damaraland, Ovampoland, and Namaqualand. Shortly after his return to England he began to turn his attention to meteorological studies and devised many improvements in methods and processes of recording. He is best known, however, in connection with his anthropological inquiries, more especially in regard to the laws of heredity. A distinguished feature of his work in these branches was the application of statistical methods. In 1869 he published *Hereditary Genius: An Inquiry into its Laws and Consequences*. In this he endeavored to show that genius is mainly a matter of ancestry. He published in 1874, *English Men of Science; Their Nature and Nurture*. This was a natural history of 180 men prominent in the English scientific world at the time, giving data concerning their ancestry, health, stature, memory, etc., derived from their own answers to questions put to them by the author. The effect was to confirm the views he had already expressed regarding heredity. A third book on the same subject was *Inquiries into Human Faculty and its Development*. In this he discussed the varied hereditary faculties of different men and the great differences existing between different families and races. He suggested the inquiry as to how far history shows the practicability of supplanting inefficient human stock with better strains, and considered whether it might not be the duty of mankind to help the supplanting process by such efforts as might be reasonable. From this began the science of eugenics, which is now occupying the serious attention of scientists and others. In the second Huxley Memorial Lecture which he delivered in 1901 before the

Anthropological Institute he applied his studies in heredity to the discussion of the possibility of improving the human breed under existing conditions of law and sentiment. In this he aimed at putting the problem of race improvement on a scientific basis. In 1904 he addressed the Sociological Society on the subject of eugenics, which he defined as the science which deals with all the influences that improve and develop the unborn qualities of the races. A few months later he endowed a research fellowship in the University of London, for the promotion of the study of national eugenics.

In addition to the development of the theory of eugenics, Galton also applied himself to many other statistical and anthropological studies. He carried out a statistical inquiry into the efficacy of prayer and came to the negative conclusion so far as objective efficacy is concerned. He also devoted much time to the subject of visions, and adopted the view that however obscure and ill-explained they may be they belong for the most part, if not altogether, to an "order of phenomena which no one dreams in other cases of calling supernatural." His name is also closely associated with the study of finger-prints. In 1895 his *Finger-Print Directories* treated the subject from a practical point of view and showed how finger-prints might be used to discover the name of a person who withheld it or gave it wrongly. A committee appointed to consider the best means of identifying habitual criminals reported in favor of Galton's finger-print system combined with Bertillon's primary measurements. In 1909 he was knighted in recognition of his scientific attainments. Among his publications, in addition to those mentioned above, are: *Tropical South Africa* (1853); *Art of Travel* (1855); *Natural Inheritance* (1889); *Finger-Prints* (1893). He was consulting editor of *Biometrika* from 1902 to the time of his death. He published in 1908 a volume of reminiscences entitled *Memoirs of my Life*. He also wrote numerous memoirs, chiefly on the subject of eugenics.

GALVESTON (TEXAS) See MUNICIPAL GOVERNMENT.

GAMBIA. A British protectorate (3600-4500 sq. miles; population, 152,005) and crown colony (4 sq. miles; population, 8807) on the west coast of Africa. Capital, Bathurst. Imports (1909), £404,560; exports, £477,964. Tonnage entered and cleared (1909), 495,963 (British, 338,604). Revenue (1909), £72,675; (customs, £56,565); expenditure, £56,237. Gambia has no debt. Governor (1911), Sir George C. Denton.

GAME LAWS IN 1911. The legislation relating to game laws in 1911 exceeded in volume any previous year. It was, however, directed rather to changes in detail than to modifying the seasons. Laws affecting game were passed in all States in which the legislatures met, excepting Nevada. In Canada game laws were passed by Manitoba, New Brunswick, Newfoundland, Ontario, and Quebec. In five States, Delaware, New York, North Dakota, Oregon, and Wyoming, the warden systems were reorganized. Nine other States increased the warden system or strengthened it in other ways. In California the State was divided into six fish and game districts and separate seasons were provided for each. State game preserves were established in Montana, North Dakota,

Idaho, Washington, Manitoba, and Newfoundland, while Massachusetts, Oregon, and Pennsylvania arranged for the creation of future preserves without further legislative action. Measures looking to the increase of game by propagation or purchase were adopted by Massachusetts, New Jersey, Indiana, and Wyoming. Provisions for the possession and disposal of game reared in private preserves under suitable regulations were made in California, Maine, Massachusetts, Michigan, Missouri, and Wisconsin.

Among the novel features of the year's legislation was the prohibition of the use of dogs wearing bells or other noise-producing devices in wild-fowl shooting in Delaware, of automobiles in duck hunting in North Dakota, and of guinea pigs in hunting rabbits in Michigan. In Michigan also a 25-day deer license with a 45-day season was established. Disbarment of claims for damage to crops by deer by the owner of lands posted against deer hunting was voted in Vermont. In Maine a measure authorized the export of game for advertising purposes.

OPEN SEASONS. Some important modifications were made in the laws relating to open seasons. In South Dakota absolute protection was given to elk and sheep; to elk in British Columbia; to deer and elk in seven counties in Idaho, and all big game in four other counties of the State; to deer in five counties of Oklahoma; and to sheep in several districts of British Columbia. The deer season was shortened in several of the States.

BAG LIMITS. A decided advance in legislation was made in limiting the bag of game. The deer limit was reduced from two to one in Minnesota and seven counties in New Hampshire. Limits were reduced in California on mountain quail; in Kansas on prairie chickens, quail, plover, and waterfowl, and in Maine on ruffed grouse and woodcock.

MISCELLANEOUS PROVISIONS. Iowa and Kansas adopted measures declaring the ownership of game to be in the State. Michigan repealed its law prescribing a penalty for the careless shooting of human beings, while New Hampshire adopted a measure of this kind. Utah provided for a State conservation commission to cooperate with federal and State departments and officials. In Vermont was created the position of State ornithologist.

NON-GAME BIRDS. The non-game bird law of Kansas was greatly strengthened. Maine placed coots, kingfishers, blue herons, and loons on the protected list, and New Hampshire revoked the authority of the commissioners to permit scientific collecting. New Jersey passed a plumage law identical with the Shea law adopted by New York in 1910.

GANGUT. See BATTLESHIPS.

GANSBACHER, JOSEF. An Austrian musician and teacher of singing, died in June, 1911. He was born in Vienna in 1829, and studied first under his father, who was a composer and organist in the Cathedral. He afterwards studied singing in both Germany and Italy and was for many years active at the Conservatory. Among the famous pupils who received instruction from him were Milka Ternina, Fritz Plank, Frau Naval, Katrina Klapsky, and Nikolaus Rothmühl.

GARBAGE AND REFUSE DISPOSAL. The disposal of garbage, ashes, paper, and other combustible refuse, as well as bottles, tin cans, old metal, and miscellaneous non-combustible

Photograph by Paul Thompson, N. Y.

SIR FRANCIS GALTON

DIED JANUARY 17, 1911

wastes, continues to be a troublesome problem in many cities. This is largely because garbage and refuse disposal is so seldom dealt with as a problem of engineering and economics, requiring technical skill in designing disposal works and good engineering and business management in their operation. Most of the larger cities of the country have got rid of their garbage for years past by what is known as the reduction process, under which (1) the grease is separated from the solid matter by boiling or steaming the garbage or else by extraction with naphtha or some other light hydrocarbon, while (2) the remaining solid matter or tankage is dried and pulverized for use as fertilizer base. This method prevails in Boston, New York, Philadelphia, Baltimore, Washington, Pittsburgh, Buffalo, Cleveland, Columbus, Cincinnati, and elsewhere, including some relatively small cities, where they have abandoned primitive means of garbage disposal, and depend upon cremation and incineration. As a rule, the older garbage furnaces were poorly constructed for their work, required much costly fuel to assist the garbage to burn, and gave trouble from smoky chimneys, imperfect burning of the garbage, and, in some cases, unpleasant odors. Within the past few years high-temperature furnaces of the British type have been introduced into the United States and Canada, with satisfactory results. In 1911 such furnaces were in use or under contract in New York City (for small outlying districts), Montgomery, Ala., Seattle, Wash., San Francisco, Cal., Vancouver, B. C., and Westmount, P. Q. Although in Great Britain, on the continent of Europe, and at Westmount the heat from garbage and refuse incinerators is utilized for raising steam for electricity and other works, conditions have not seemed to favor the practice as yet in this country. This is partly due to differences in labor conditions and in demands for electric current.

It should be explained that, while garbage reduction works treat garbage only, incinerating plants do best when such combustible refuse as is available is mixed with the garbage. Abroad, garbage, ashes, and other refuse are commonly dumped promiscuously into "dustbins," and subsequently burned together. The general practice in the United States is to make at least two separate collections: one for garbage and one for ashes, and (except where garbage reduction is practiced) to mix more or less miscellaneous refuse with the garbage on the one hand and the ashes on the other. At Milwaukee, the perhaps novel plan of taking to the incinerating plant just enough of the nearest ashes and combustible refuse to aid best in the burning of the garbage has been practiced. Half garbage and half ashes and other refuse was the aim at the outset. In 1911, partly as a result of studies made by engineers under direction of the Milwaukee bureau of economy and efficiency, the percentage of garbage burned was increased to about sixty per cent. As a result of these and other studies made by the bureau named the efficiency of the Milwaukee furnaces was materially increased (see special report of the bureau; also brief abstract in *Engineering News*, September 7, 1911).

With two exceptions, all the garbage reduction works in the United States are owned and worked by private companies. The plant at Cleveland, O., was bought by the city in 1905

and in 1910, Columbus, O., built a plant. A comparative study of the operating results of these two municipally owned plants, prepared by John H. Gregory, was published in *Engineering News* of November 30, 1911. For the year 1910, the Cleveland reduction works yielded a net revenue of \$1.60 per ton of garbage treated, after allowing for operating expenses, depreciation, and capital charges. This revenue came from the grease and tankage produced. The average price of grease in 1910 was 3.84 cents per pound, and of tankage \$7.19 per ton. The grease was 3.75 per cent. (by weight) of the garbage treated, and 3,350,064 pounds, or 1678 short tons, were produced. At Columbus, during the first six months of 1911, the reduction works also showed a profit, but owing to the fact that the plant was not yet being operated at full capacity the profit was less than that made at Cleveland. The grease at Columbus was 2.57 per cent. and the tankage about 15 per cent. (by weight) of the garbage before treatment. With improvements proposed, the percentage of grease is expected to go to 2.8. The average price of grease at Columbus during the first half of 1911 was 5.19 cents a pound and of tankage, \$10.28 a ton. The Cleveland and Columbus figures are significant because never before had such detailed financial results of garbage reduction works been published and also because of their indication that the final disposal of garbage can be effected at a profit. It should be understood, however, that this profit applies only to disposal (i. e. not to collection and disposal), but in each case freight charges for conveying the garbage by rail from the city to the works were deducted from the gross revenue.

A study of the refuse disposal problem at Toronto, Ontario, made in 1911, indicated that the most economical solution would be reduction for the garbage and incineration for combustible refuse, rather than incineration for both garbage and refuse. It was at first supposed that incineration of mixed refuse would be most economical with utilization of the heat of combustion to generate electricity, but the low cost at which electric current from Niagara Falls is delivered in Toronto by the provincial hydro-electric commission would make it cheaper to use the current and let the heat go to waste instead of building and operating the plant necessary for its utilization. Indications are that reduction and incineration works for Toronto taken together would yield a slight revenue when the population of the city reaches 600,000, provided that the salable portions of the combustible refuse are sorted out and marketed. Otherwise there would be slight expense for garbage and refuse disposal.

Where garbage is not treated in reduction plants nor burned, it is sometimes dumped more or less promiscuously in some out-of-the-way places, which is liable to cause a nuisance. A better plan is to bury it under six to twelve inches of earth. City garbage is sometimes fed to hogs, as is the almost universal practice with garbage produced on farms and in rural districts generally. If the garbage is reasonably fresh, properly handled, and the piggeries well kept, there is little more reasonable objection to feeding the city refuse to hogs than country garbage. It is, of course, difficult to keep it fresh, especially in hot weather, and, where collected in large cities, there are obvious difficulties in

keeping a garbage piggery in a thoroughly sanitary condition. Many of the dangers portrayed, however, are more imaginary than real. The Bureau of Animal Industry, United States Department of Agriculture, is authority for the statement that feeding garbage to hogs causes tuberculosis among them, but it adds that this is no more true of garbage than of unsterilized milk. Heat properly applied will remove this danger from either garbage or milk.

Finally, a few words may be said about the garbage and refuse disposal in relation to the health of human beings. Broadly speaking, the collection and disposal of these wastes is a matter of comfort and convenience and aesthetics rather than health. So far as infection from specific disease germs is concerned, a dollar spent in any one of many other lines of health protective work would be worth a hundred spent on garbage disposal. Most of what is written and said about garbage and health harks back to the old theory that infectious diseases arise *de novo* from filth, instead of spreading from the infected person to the non-infected human being. Allegations that the garbage can is a menace because flies breed in garbage should also be received with caution and a regard for governing conditions. In the first place, according to Dr. L. O. Howard's *The House Fly; Disease Carrier* (New York, 1911) the house fly rarely breeds in garbage, and in the second place the time which elapses between the laying of the eggs of the fly and the development of adult insects is longer than the intervals between garbage collection in most of even the poorest scavenged cities.

GARDNER, OBADIAH. United States senator (Democrat) from Maine. He was born in 1852, in Grant, St. Clair county, Michigan. At the age of twelve years he removed to Maine, where he attended the common schools and Colburn Classical Institute. He engaged in farming and in the lime and lumber business at Rockland, Me. From 1872 he held various positions in the city government of that city. He was a member of the State Board of Agriculture, and from 1897 to 1907 was master of the State Grange. In 1908 he received the unanimous nomination for governor of the State by the Democrats and came within 7000 votes of election. He was appointed United States senator on September 23, 1911, to fill the vacancy caused by the death of Senator William P. Frye (q. v.).

GEOGRAPHICAL SOCIETY, AMERICAN. A learned society organized in 1852 for the investigation and dissemination of any geographical knowledge by discussion, lectures, and publication; for the encouragement of geographical exploration and discovery; and for the establishment in the chief maritime city of the country, for the benefit of commerce and navigation and the great industrial and material interests of the United States, a place where the means shall be afforded of obtaining correct

information for public use concerning every part of the globe. In 1911 the fellows of the society numbered 1210. The library contains about 50,000 volumes and is constantly increasing. Two gold medals are awarded at the discretion of the executive council. These medals are bequests from General Cullum and Charles P. Daly, and are called the Cullum and Daly medals respectively. The Cullum medal was awarded in 1911 to Dr. Hermann Wagner of Göttingen, Germany, in recognition of his great services to the science of geography. The Charles P. Daly medal was awarded to Grove Karl Gilbert, of Washington, D. C., in recognition of his many notable contributions to knowledge in the field of physical geography. On May 15, 1911, possession was taken of the new home of the society, erected at a cost of \$250,000. The land on which the building stands was the gift of the late Collis P. Huntington. The building is equipped with the most modern appliances for research and includes rooms for the editorial and library force, the map floor, and the drafting floor, besides accommodations for meetings in the social life of its members. The society issues a *Bulletin*, the *Geographical Record*, the *Scientific Notes*, and original papers. The officers in 1911 were as follows: President Archer M. Huntington; vice-president, John Greenough; treasurer, Henry Paris, Jr.; domestic corresponding secretary, Archibald D. Russell. The editor of publications is C. C. Adams.

GEOGRAPHIC SOCIETY, NATIONAL. A learned body, founded in 1888 with the object of collecting and diffusing geographic knowledge through its official organ, the *National Geographic Magazine*. The society has maintained during the summers of 1909-10-11 an expedition in Alaska, headed by Prof. Ralph S. Tarr of Cornell University and Prof. Lawrence Martin of the University of Wisconsin. This expedition made an investigation of the glaciers of Copper River, and Yukatat Bay, and Prince William's Sound. The work was finished in 1911 and the scientific data given to the world. A course of twenty lectures is given by the society from November to April. The officers in 1911 were: President, Henry Gannett; vice-president, O. H. Tittmann; secretary, O. P. Austin; treasurer and editor, Gilbert H. Grosvenor, whose headquarters are the Society Building, Memorial Hall, Washington, D. C. The membership in 1911 was about 90,000.

GEOLOGY. INTRODUCTION. The recent developments in geology, so far as their trend may be gauged from our present standpoint, have marked a material advance for the different branches, probably of equal importance with the gains made at any time in the past. The basis of nearly all geological work is of course the areal map, and with the growing appreciation of its value to mining, agriculture, and other industries the field of operations of public surveys has been greatly extended. Such surveys are now established in many parts of the world and are reaching out farther and farther each year into the unexplored areas. Their scope is not restricted, as a rule, to map-making alone, but they usually carry on various investigations of scientific or practical import that are beyond the facilities and means of individual workers, and to some extent exercise a directive influence upon geological progress. In the foundations of geology no radical change can be said to have taken place within the last few years.

The most interesting discovery bearing upon established notions of earth history was, undoubtedly, the radio-active properties of rocks, of which the first definite account was given by Strutt. This new form of energy seemed practically to nullify the theories of a cooling earth and of all phenomena dependent upon that condition; later opinion, however, tended to circumscribe its influence, though recognizing that it should be considered as an offset in some measure for the loss of heat by radiation. The main effect of the discovery, thus, has been to expand previous estimates of the earth's age according to purely physical methods of calculation, as employed, for example, by Lord Kelvin. In this result most geologists have been very willing to concur. Recent explorations in the very ancient rock formations which antedate the fossiliferous series have indicated that the conditions surrounding their genesis were not widely dissimilar from those of later periods, and that the length of pre-Cambrian time very likely is of the same order of magnitude as the whole subsequent era covered by the records of life forms. The evidences of glacial geology, curiously enough, have likewise added some chapters to the long and complex history of the globe. The ice invasion which took place in the Pleistocene period was not, apparently, a unique episode, marking the culmination of a gradual climatic change that began in remote ages; but there seems to have been several glacial epochs before it, one of them possibly within early pre-Cambrian time.

The review that follows is more particularly concerned with the events of the year 1911. While it can be only a fragmentary record, its aim is to afford some idea of the year's progress by selecting for notice those topics which have a broad rather than a very specific bearing upon the science.

STRATIGRAPHICAL CLASSIFICATION. A contribution to the subject of stratigraphical nomenclature by E. O. Ulrich proposed some far-reaching modifications in the generally accepted schemes as applied to Paleozoic rocks. In justifying the claim of the new system to recognition the author states that the advance of knowledge in this field has long outgrown the old arrangement which had for its basis a single line of evidence—that afforded by the fossil faunas and floras. The insufficiency of purely paleontological methods of correlation has frequently found expression; and one result has been the so-called dual system, in use by some authorities, which arranges the geological column according both to natural rock groups and to the dominant life forms. To that method Ulrich objects that it divorces rather than combines the two lines of evidence, whereas neither is alone capable of supplying the data for a positive standard. The use of fossils by themselves may suffice for classifying the strata within a single province, but in the correlation of the units of distinct areas there is need also for data of physical nature, or those supplied by diastrophism. In the new system all available evidences have been drawn upon to prepare a single chronological standard. Without going into the details of the proposed changes it may be said that the Paleozoic era, as now defined, is divided into two parts—the Eopaleozoic and the Neopaleozoic. The former era is arranged into four periods by the intercalation of two new members and includes in order the Cambrian,

Ozarkian, Canadian, and Ordovician. The Ozarkian and Canadian have been inserted for the purpose of properly recognizing certain units, the relations of which are considered by the author to have been misinterpreted and their importance underestimated. The Neopaleozoic era is also divided into four periods, including the Silurian, Devonian, Waverlyan, and Tennesseean. The question whether the new scheme fulfills all the requirements of a general standard has not yet received authoritative consideration; the weak point against its wide application is, admittedly, that the evidences have been gathered from a rather limited region, mainly in the southeastern section of this country.

DYNAMICAL GEOLOGY. The theory of isostasy, as an explanation of regional uplifts and subsidences of the earth's crust, has received much attention since the results obtained by Hayford were published in recent reports of the United States Coast and Geodetic Survey. This theory, it may be explained, is opposed to the earlier conception of a rigid earth which by its inherent strength alone sustains the continental platforms above sea-level, and postulates that the inequalities of the surface are counterbalanced by variations of rock density below. A mountain range, for example, by its excess of mass implies a deficiency of density, while depressions like ocean basins require an increased density in the underlying strata. An essential corollary, of great significance geologically, is that any change of load upon a part of the crust, such as is continually arising from the erosion of rock material in one place and its deposition in another, finds compensation by flowage in the substratum from areas of excessive weight to areas deficient in weight. In this flowage and its dragging effect upon the overlying structure some geologists would find the cause for folding, crushing, and differential movements of rocks which have generally been regarded as the results of contraction of a cooling globe. The theory has been subjected to careful analysis by Harmon Lewis, who concludes that Hayford's observations may be accepted in proof of some sort of isostatic compensation, though he believes its nature is not yet capable of determination. The principle may apply very well to major inequalities as illustrated by the ocean basins, but the evidence is against its operation in the case of local topographical features, at least in a complete way. Furthermore, the flowage of material at depths below sixty miles, which is the upper limit set by Hayford for compensation, would scarcely cause the observed effects of folding in the upper few miles of the earth's surface. This folding is evidence of lateral compression of enormous magnitude, whereas the controlling movements of isostasy are in a vertical direction.

In a paper on temperature gradients J. Königsberger states the conclusion that there is a normal ratio for the increase of heat with depth which holds true over the whole earth. Deviations from this ratio may be ascribed to local influences, heat producing processes, or to incompletely cooled lavas. Observations collected from different localities show the gain of temperature to be slower in the vicinity of large water bodies, especially on long peninsulas, and to be more rapid within recent eruptive regions. The latter feature may be of significance for the prediction of volcanic outbursts; the natives of Central America, it is stated, recognize in the

drying up of vegetation about a volcano an infallible sign of an approaching eruption.

ORIGIN OF THE OCEANS. In a study of the origin of the deep sea and its peculiar life forms J. Walther states that the oceanic basins are bottomed by sediments quite distinct in character from those laid down in shallow seas or at depths not exceeding 2000 meters. These sediments contain no quartz or other fragments of continental rocks; they contain no plant residues of brown or black color, nor remains of shallow sea animals or plant-feeders; and they are arranged in horizontal layers which spread over enormous areas. The continental lands have been depressed below sea-level repeatedly since the beginning of geological history, but in all the accumulations of sediments there is no fossil-bearing member of either Paleozoic or Mesozoic age that corresponds to the present sediments of the deep sea. It is probable, therefore, that the deep sea has existed in its present form for a long period and has not essentially shifted its place on the earth's surface since its origin. In different periods of geological time great land areas have sunk below the surface of the sea to be united to the deep basins. These depressions have been connected with epochs of mountain building, of which the greatest was at the close of the Paleozoic. It was during this convulsion, probably, that the deep sea basins originated, as is further evidenced by the fact that the deep sea fauna is lacking in Paleozoic elements but consists predominantly of Mesozoic types.

THERMAL SPRINGS. From his investigations of the geysers and hot springs of the Yellowstone Park, Arnold Hague concludes that the source of the water is not deep-seated or connected with igneous emanations, but comes from the surplus supply fed by rainfall. This penetrates downward to a sufficient distance to become heated and then is forced upward to the surface, where in the first stages it forms hot springs and pools. In time the solvent influence of the hot water enlarges the channels to considerable reservoirs, a process that may lead to geyser phenomena. The latter are more or less transitory, for, if the overflow or the dissipation of heat is increased sufficiently, explosive action will cease and the geyser becomes a hot spring, which is the final stage of thermal activity. The playing out of a geyser is not an indication that the source of heat below has been dissipated, but is due to the shifting of its channels. There are many features connected with the geysers that appear inconsistent with an igneous theory of origin; of critical importance may be mentioned the frequent variations of temperature, progressive transitions in chemical composition, lack of uniformity in mode of occurrence, and shifting points of discharge.

PETROGRAPHY. The present status of this study was the subject of the presidential address, delivered by Harker before the geological section of the British Association. In recent work upon the relations and distribution of the igneous rocks, one of the most important conceptions that has been developed is concerned with petrographical provinces, by which is meant that the rocks in an area of igneous activity formed at a given geological period present a certain community of chemical and mineral characters. This relationship may be explained as the result of a common origin.

The simplest view is to suppose that all the rocks of a province are derived from a single igneous magma, which originally was homogeneous. The variations found in the individual members can be traced to a process of cleavage or differentiation of the parent mass. Starting on this assumption, Harker believes there are two fundamentally distinct categories recognizable among igneous rocks, the one andesitic or calcic, and the other tephritic or alkaline. A given petrographical province belongs either to the calcic or the alkaline branch, typical members of the two not being found together. A survey of the known areas shows that the calcic has a decided preponderance over the alkaline branch. The distribution is of special significance in regard to geographical distribution, as illustrated by the more recent rocks, which can be mapped into great continuous regions of alkaline rocks on the one hand and calcic members on the other. The principle underlying this distribution is believed to be connected with the different kinds of stresses set up in the earth's crust and the ways of their relief. Thus, the alkaline rocks are typically associated with areas of subsidence caused by radial contraction of the globe and the calcic with folded areas ascribable to lateral compression. This view coincides with that held by Suess, who distinguished the two types, respectively, as Atlantic and Pacific, from their fields of distribution. As a next step in the natural grouping of igneous rocks, is suggested the comparison of the characteristics of the various provinces. This has been done in some instances, and expressed in more or less concise terms; among alkaline rocks by the relative ratios of potash to soda. A more precise way would be to average the chemical analyses of the chief rock types, weighted according to their relative abundance, and thus to calculate the approximate composition of the original magma. If this were done it would probably be found that the provincial magmas may be reduced to a limited number of types.

FORMATION OF DOLOMITE. The problem of the origin of dolomite, one of the commoner rock-forming materials, is attacked by Steidtmann, who concludes that it is 'predominantly a sea deposit and not the result of metamorphism acting on limestones after their emergence from the sea. The fact that less and less dolomite occurs in passing from the older to the younger rock formations indicates a progressive change in the conditions of deposition. The factor that has controlled this change is probably the chemical composition of the sea, and this is believed to have undergone decided modification since early geologic times in that the amount of calcium held in solution has largely increased in proportion to that of magnesium. It would appear that the present streams carry into the sea more calcium relatively than those of the primitive lands. The precipitation of dolomite is favored by solutions containing a high percentage of magnesium. By experimentation, G. Linck found that a substance of almost the same composition as dolomite can be prepared in the laboratory by adding calcium chloride to a solution of magnesium chloride, magnesium sulphate, and ammonium carbonate; on shaking a thick amorphous precipitate forms, which by heating becomes crystalline. The precipitate has the composition of dolomite, but is weakly doubly refracting and optically positive. It ap-

pears probable that dolomite may be formed in the sea by a related reaction between its magnesium and calcium salts and ammonium carbonate, which arises from the decay of organic matter.

GLACIAL GEOLOGY. The efficiency of glacial ice as an erosive agent has furnished a topic for much discussion, which, however, has not seriously altered the general attitude in regard to the subject. The weight of opinion still holds that the Pleistocene ice-sheet and its shrunken remnants represented by the glaciers of to-day have exercised a profound and very characteristic influence upon topography. The effects have naturally varied with local conditions. According to F. B. Taylor, the continental ice invasion was not responsible for the excavation of the basins occupied by the Great Lakes, and ice erosion in that vicinity was very limited, owing to lack of concentration and the steep gradient necessary for a relatively high velocity of flow. Certain features of Alpine scenery were ascribed by T. C. Chamberlin, to the work of ice rather than to atmospheric agencies; and the effects of the ice-cap upon the topography of Iceland were brought out by F. E. Wright.

The report of an international committee, which is collecting information on the variations of existing glaciers indicates that nearly all are now in process of retreat. Of the Alpine glaciers, only a few in the Oetzthal have made advances and these are but temporary fluctuations; the general retreat has lasted for several decades and for the greater number since the beginning of the last century. The coastal glaciers of Scandinavia have recently shown an advance, but those in the interior have not participated in it. The glaciers of the Caucasus, Thian-Shan, Altai, Pamirs, and Himalayas are in retreat, likewise those in the United States and Canada. In Alaska there have been some local advances, of which the glaciers in Yakutat Bay have supplied the most remarkable instances. On the other hand the retreat of the glaciers from Glacier Bay has enlarged the latter by nineteen square miles since 1892.

ORE DEPOSITS. The contributions to this branch of applied geology have included some noteworthy general treatises, besides the usual volume of papers and reports relating to special fields. Among the former may be mentioned the work on which the German authorities, Beyschlag and Krusch, and the Norwegian geologist, Vogt have coöperated; the first volume of the three to be issued shows a comprehensive and discriminating treatment of the subject that should make it a valuable reference work for the student. The well-known treatise by Professor Beck, of Freiburg, may also be included in the list, for it has recently passed into its third edition, so revised and augmented as to have the character almost of a new compendium, though following the admirable lines of the preceding volumes. Still another German work, but limited in subject matter to the non-metallic mineral accumulations, is by O. Stutzer.

One of the principal methods by which ore-bodies are now recognized to have been laid down in rocks is that of replacement, giving rise to the replacement or metasomatic type of deposits. In contrast with the ordinary fissure veins, such deposits are not defined in regard to position or shape by preëxisting cavities, but have grown, so to speak, within the rocks themselves by a chemical interchange of

ore for the rock material. Accumulations of this kind are particularly common in the more soluble strata like limestones, and are important sources of copper, lead, zinc, and other ores. A recent paper by J. D. Irving describes the general features of replacement deposits and gives a very clear exposition of the principles governing their occurrence.

PETROLEUM. The geology of petroleum supplies the subject for a volume by H. Höfer, the first instalment of a comprehensive treatise that is intended to cover practically the whole field of scientific information on petroleum and its related materials. Various authorities have contributed descriptions of the petroleum fields in different countries. Of special interest to geologists is the chapter by Engler and Höfer on the origin of petroleum, concerning which the authors present some interesting, though not altogether novel, views. Petroleum is considered to be organic in its nature and mainly an animal product. The process of its formation was one of distillation combined with fermentation, and took place under heavy pressure, but not necessarily high temperatures. Essential to the process was the protection of the matter from the air soon after its accumulation; otherwise it would rapidly oxidize and be destroyed. The accumulation of considerable deposits has been facilitated by the action of gravity, as well as by the pressure of gas, which has brought about a local concentration of the disseminated oil particles. The pools occur most frequently in marine formations of shallow water or littoral type. Owing to the local migration under pressure and gravity, the oil is now found largely in anticlinal and quaquaversal folds, where it lies between accumulations of gas above and water below, the latter being usually salt. If water fails, the pools may form in synclinals. There is a definite relation between the productivity of a pool and the air pressure, the former being greater or smaller as the pressure falls or rises. Asphalt, ozocerite, and the heavy bitumens are explained as originating from petroleum, through evaporation, oxidation, and polymerization.

GEORGE V., COBONATION OF. See *GREAT BRITAIN, History*.

GEORGETOWN UNIVERSITY. An institution of higher learning, under the auspices of the Roman Catholic Church, founded in 1789, at Washington, D. C. The number of students enrolled in the various departments of the university in 1910-11 was 1280. The faculty numbered 147. There were no notable gifts during the year and no noteworthy changes in the faculty. The library contains about 100,000 volumes. The president is Rev. Joseph J. Himmel, S. J.

GEORGIA. POPULATION. The Thirteenth Census, taken in 1910, showed a population of 2,609,121, as compared with 2,216,321 in 1900. The principal cities with their populations in 1910 and 1900 are as follows (the figures in parenthesis are for 1900): Atlanta, 154,839 (89,872); Savannah, 65,064 (54,244); Augusta, 41,040 (39,441); Macon, 40,665 (23,272); Columbus, 20,544 (17,614).

AGRICULTURE. The Thirteenth Census included statistics of agriculture. These are of date of April 15, 1912. On that date the farms in the State numbered 291,027. The land in farms was 26,953,413 acres; the improved land in farms, 12,298,017 acres. The average acres per

farm was 92.92. These figures, except for those of improved land in farms and average acres per farm, are almost exactly the same as for 1900. In that year the improved land in farms was 10,615,644 acres and the average acres per farm 117.5. The total value of the farm property in the State in 1910 was \$580,546,381, compared with \$228,374,037 in 1900. The average value of all property per farm was \$1995, compared with \$1016 in 1900. The average value of land per acre was \$13.74, compared with \$5.25 in 1900. Of the farms operated by persons owning all or part of the land, 78,004 were free from mortgage and 18,257 were under mortgage. The farms operated by owners and managers numbered 100,047, and those operated by tenants 190,980. The native white farmers numbered 168,803; foreign-born white 385; negro and other non-white 122,559. Of the non-white farmers, all but 5 were negroes, 3 being Indians, and 2 Chinese. The value of the various kinds of domestic animals, poultry, and bees was \$80,393,993 in 1910, compared with \$35,200,507 in 1900. The cattle numbered 1,080,316, valued at \$14,000,958; horses, 120,067, valued at \$14,193,830; mules, 205,348, valued at \$43,974,011; swine, 1,783,684, valued at \$5,420,016; sheep, 187,644, valued at \$308,212. Poultry of all kinds numbered 5,328,584, valued at \$2,088,653. The acreage, production, and value of the principal crops will be found in the following table:

	Acreage	Prod., bu.	Value
Corn1911	3,692,000	59,072,000	\$49,030,000
.....1910	3,585,000	51,982,000	40,546,000

MINERAL PRODUCTION. The total value of the mineral products of the State in 1910 was \$6,048,255, compared with a value in 1909 of \$5,580,643. Clay products were valued at \$2,532,038; stone at \$2,027,339. The iron ore mined in the State in 1910 amounted to 313,878 tons, valued at \$482,659, as compared with 221,016 tons, valued at \$332,478 in 1909. Gold was produced in 1910 to the amount of 1722 fine ounces, valued at \$35,602. A small amount of silver was also mined.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State include the following: Georgia Baptist Orphans' Home, Hapeville; Decatur (Methodist) Orphans' Home, Decatur; Hebrew Orphans' Home, Atlanta; South Georgia Methodist Orphans' Home, Macon; Masonic Home, Macon; Georgia Industrial Home; Orphans' Home for Colored Children, Columbus; Orphans' Home, Savannah; State Reformatory, Milledgeville; and Fulton County Reformatory, Hapeville.

POLITICS AND GOVERNMENT

The legislature met in 1911 and passed several important measures, which are noted in the paragraph *Legislation* below. On July 1 Hoke

Smith, who, on October 5, 1910, was elected governor of the State, was inaugurated.

The death of Senator Clay made it necessary for the legislature to choose his successor. Joseph M. Terrell had been appointed in 1910 by Governor Brown to fill out the unexpired term. On July 12 the legislature elected Governor Smith, who had assumed office as noted above, United States senator. This brought about a unique situation. Mr. Smith was desirous to carry into effect several important measures as governor. On Smith's election to the Senate, Mr. Terrell resigned, having been previously stricken with paralysis in Washington, forcing his return to Georgia. Mr. Terrell held that his term ended automatically with Smith's election, but he tendered his resignation in order to remove all doubt. To this letter Governor Smith replied, holding that Senator Terrell was still senator, until he (Governor Smith) qualified, and that he had no intention of so doing until the session of the legislature came to an end. He requested Senator Terrell to withdraw his resignation. This Terrell refused to do, as he was physically unable to return to Washington, and Georgia remained with a single representative in the Senate during the remainder of the session of Congress. On the convening of the Sixty-second Congress, Mr. Smith was sworn in as senator.

The election of Senator Smith made it necessary to hold another election for governor. The candidates for the office were Joseph M. Brown, who, in 1910, was defeated by Governor Smith, R. B. Russell, justice of the Court of Appeals, and Pope Brown, former State treasurer. In the primaries held on December 7 Mr. Brown carried 90 of the 146 counties of the State, and received a large majority of the votes. An important issue of the campaign was the liquor question. Mr. Brown had declared that he would veto any further liquor legislation that was not submitted to the people, and advocated the submission of the repeal or retention of the present Statewide prohibition law to the popular vote. Pope Brown stood for the present Statewide law and extreme prohibition, while Judge Russell advocated the immediate repeal of the present Statewide law, favoring the substitution of local option.

On December 12 the State Democratic executive committee met in Atlanta to canvass the vote for governor and to outline the conduct of the campaign in 1912. The committee decided that a Statewide presidential primary election should be held at some date after the second Wednesday in April, 1912, and not later than June 12. On September 27 the voters of Atlanta rejected the proposed charter providing for the commission form of government.

OTHER EVENTS. On March 24 the Merchants and Miners' Transportation Company was fined \$20,000 by Judge Speer of the United States Circuit Court at Savannah for granting discrimination in rates on grain shipments.

STATE GOVERNMENT, 1911. Governor-elect, J. E. Brown (see above); Secretary of State, Philip Cook; Treasurer, William J. Speer; Comptroller and ex-officio Com. of Insurance, W. A. Wright; Attorney-General, Thomas S. Felder; Supt. of Education, M. L. Brittain; Commissioner of Agriculture, Thomas G. Hudson—all Democrats.

JUDICIARY. Supreme Court: Chief Justice William H. Fish; Beverly D. Evans, Presiding

Justice; Associate Justices, J. H. Lumpkin, M. W. Beck, Samuel C. Atkinson, and Horace M. Holden; Clerk, Z. D. Harrison—all Democrats.

STATE LEGISLATURE, 1911. Democrats, Senate, 13; House, 182; joint ballot, 225; Republicans, Senate, 1; House, 1; joint ballot, 2; Democratic majority, Senate, 42; House, 181; joint ballot, 223.

The representation in Congress will be found in the article UNITED STATES, section *Congress*.

GEORGIA, UNIVERSITY OF. An institution of higher learning at Athens, Ga., founded in 1785. The number of students enrolled in the various departments of the university in 1911-12, was 619. The faculty numbered 50. There were no notable changes in the faculty during the year, and no noteworthy benefactions were received. The productive funds of the university amounted to \$390,916, and the annual income to about \$170,000. The president is D. C. Barrow, A. M.

GERMAN ELECTION LAW. See NEW JERSEY.

GERMAN ANTARCTIC EXPEDITION. See POLAR RESEARCH.

GERMAN DRAMA. See GERMAN LITERATURE.

GERMAN EAST AFRICA. A German protectorate, bordering on the Indian Ocean. Estimated area, 365,000 sq. miles; estimated population, 7,000,000. There are government and mission schools. Cacao, coffee, vanilla, tobacco, rubber, sugar, tea, cotton, coconuts, cardamoms, cinchona, and fibre plants are raised on the German plantations. Minerals exist, and gems are found in large quantities. Imports (1909), 33,941,707 marks; exports, 13,119,481 (rubber, 2,543,365 marks; sisal, 2,323,025; ivory, 900,085; copra, 797,946; coffee, 731,590; wax, 403,301). Railways, 212 miles. Work on the extension from Mrogoro to Kilimatinde (240 miles) progresses. Telegraph lines, 1500 miles. Post offices, 39. Revenue and expenditure (estimate '910-11) balanced at 14,605,000 marks (including imperial subvention of 3,545,000 marks). Governor (1911), Baron von Rechenberg; seat of government, Dar-es-Salaam.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. A religious denomination, founded in 1840 at Gravois Settlement, near St. Louis, as the Evangelical Association of the West. In 1877 the present name was adopted. The synod represents in doctrine the Prussian Union of 1817. It is found in almost all the States of the Union and parts of Canada, but its strength is greatest in the central and north central States. The most recent statistics show 1047 pastors, 1295 churches, and 236,615 communicants, and 117,390 Sunday-school scholars. The total value of the church property is about \$14,000,000. The amount contributed for the maintenance of churches during 1911 was \$1,910,505; for church work and benevolences, \$185,428. The denomination maintains missions in the Central Provinces of India, where there are 8 men missionaries, 11 women missionaries, 68 native helpers, and 135 native teachers. Elmhurst College, at Elmhurst, Ill., is under the auspices of the denomination, which also supports the Eden Theological Seminary at St. Louis. The work of the synod, which was formerly carried on exclusively in the German language, is now being done in English to a considerable extent,

especially in the large cities. The official organs are *Der Friedensbote* and *The Messenger of Peace*. Charitable institutions are maintained for orphans, superannuated ministers, and the widows and orphans of deceased ministers. Nine institutions are engaged in deaconess work according to the Kaisersrath model.

GERMANIC PHILOLOGY. See PHILOLOGY, MODERN.

GERMAN LITERATURE. The year 1911 has, like its predecessor, been a rather quiet one in the German book-world. The generation, which in the parlance of the period had revalued old values, religious, moral and æsthetic, and stood sponsor for the Young Germany of the century's end, has reached maturity and paused in its work of revolt and reform. So marked is the sane and moderate tenor of its utterances today, as compared with the vociferous language of some twenty-odd years ago, that the question which appeared as the headline of an article in a prominent periodical, "Is Nietzsche Dead?" struck many readers as exceedingly timely. The present tendency seems rather to be towards revising the new values and returning to the old, or to compromise between them. Unfortunately the reaction seems to have affected the attitude of the authorities, which assume a certain degree of censorship over literary matters in the empire. That a publisher and an editor should be fined for reproducing a part of the journals of Flaubert and that the police should prohibit the performance of a play founded upon Bertha von Suttner's world-famed story *Die Waffen nieder* (Ground Arms), is very curious. On the other hand it is encouraging to learn that the reign of the best seller seems a thing of the past. Lists of books most in demand, or most frequently reëdited are no longer accorded so conspicuous a place in the columns of magazines as they were a few years ago. It speaks well for the taste of the average book buyer that Clara Viebig's story of Berlin after 1870, *Die vor den Toren*, which was published in 1910, should within a year have reached its fifteenth thousand, and been but little behind the best advertised sensational success of the year. It is also pleasant to note, that the dismal failure of Gerhart Hauptmann's last play *Ratten* at the Lessing theater in Berlin, in January, in no way affected the success of his story *Der Narr in Christo*, which had been published a few months before, and which within a year has reached its eighteenth edition. After all, Hauptmann is a personality standing for the modern school and his hold upon the reading public of his country is merited. One of the great successes in fiction recorded for the year 1910, Enrica Händel-Mazetti's *Die arme Margaret* came into new prominence when an over-zealous admirer accused Karl Schönherr, whose highly praised drama *Glaube und Heimat* had its initial performance at the end of the year, of having plagiarized Frau Händel-Mazetti's ideas, a charge which was proved baseless, but from which controversy the famous dramatist did not emerge without some loss of dignity. Aside from this unpleasant incident the course of literary production during the year 1911 was unmarred by any sensational occurrence.

FICTION. It cannot be said that the year 1911 has had any one great novel, whether historical or of contemporary life, but it has had several that narrowly miss the quality of true greatness. Ernst von Wolzogen's *Der Erzketzer* is

an exhaustive study of the independent mind and the artistic temperament in conflict with the traditions of conventional society, based largely upon the author's own life, but none the less trustworthy as a picture of his time and his world. Grete Meisel-Hess, whose sociological treatise *Die sexuelle Krise* is being discussed among students of the problems of sex and society, has summarized the divers currents of thought and waves of emotion that sway the present generation in a comprehensive picture of life among the intellectuals of Vienna and Berlin, which is most significant for the future historian of the morals and manners of our time. Korfiz Holm covers a part of the same ground in his novel *Die Tochter*, the story of a famous writer and his only child, who leaves him to seek self-expression on the stage, but returns disillusioned and finally finds the love that reconciles her with life. That book, too, contains the portraits of contemporary types easily recognized in the artistic circles of Germany. A semi-biographical novel of unusual interest is Helene Boehlau's *Isobies*, a fascinating record of the author's extraordinary career, written in her exquisitely individual style. All these stories with their glimpses of life in the world of art, letters, and music in Berlin, Munich, and Vienna are important contributions to the more intimate chronicles of the period. Among novels by women about women, which are multiplying enormously, Gabriele Reuter's *Frühlingsträume* deserves a prominent place, treating with profound insight the tragedy of the actress who convinces by her art, but fails to find credence in life. Helene Mühlau has touched upon one of the most vital problems of the day in her story of an army officer's family, *Nach dem dritten Kind*, and in *Eine irrende Seele* sympathetically traces the pilgrimage of an over-sensitive soul in conflict with the cruel realities of the world. Ida Boy-Ed in *Mir wer die Schusucht Kennt* offers an eloquent plea for the emotional young wife, estranged by the husband's long absence in foreign countries and led astray by the glamour of a girlhood love. The latest novel by Graf Keyserling, *Wellen*, properly belongs to this class, because it deals mainly with a woman who had married before she knew her mind and on being divorced by her husband finds herself declassée through her marriage to her lover. Thus the problem of love and marriage seems more and more to dominate the fiction of modern Germany and in the delineation of the heroines, there is an evident tendency towards finer individualization. A strikingly original variation of the theme is presented by the Swiss author Ernst Zahn, who in *Die Frauen von Tanno* treats the complications which ensue when a priest and a pedagogue-reformer attempt to enforce celibacy upon the women of a rural community ravaged by an ailment which seems hereditary. Another unusual theme is handled by Carlot Reuling in *Die Strasse der Erkenntnis*, the hero of which suffers from having fallen heir to his father's fame and when he proposes to the girl he loves, discovers that here, too, his progenitor had anticipated him. An intimate study of the struggles of two Englishwomen of the Victorian era handicapped by their gentle birth is the burden of Gerhard Ouckama Knoop's *Verfallstag*. Hermann Stegemann, the Alsatian, interests his readers in the character of a country girl of the Black Forest, who leaves her village as servant in a summer hotel and returns as wife of the

owner. Karl Bittermann relates with great dramatic force the fate of a peasant driven to the city by circumstances, but finding her way back to her native soil and herself. A semi-historical novel is Rudolf Herzog's *Burgkinder*, which covers the period from the French Revolution to the empire and alternately shifts its scene from the Rhine to the Seine. From the older generation have come some new books: One by Rosegger and posthumous volumes by Adolf Wilbrandt, Wilhelm Jensen, Adolf Stern, and Wilhelm Raabe. Among short shorties those arranged in Decameron-fashion and called *Der goldene Spiegel*, by Jakob Wassermann, rank first as artistic achievements. Hermann Sudermann's *Die indische Lilie* is a clever successor of the author's first book of short stories, published about twenty-five years ago. A great variety of themes is treated by Franz Servaes in his volume *Wenn der Traum zerrinnt*, yet he has succeeded in justifying the collective title.

DRAMA. The two great rivals for supremacy on the German stage to-day, Hermann Sudermann and Gerhart Hauptmann, have both failed to score a success with their latest plays: Hermann Sudermann, with his drama in blank verse *Der Bettler von Syrakus* and Gerhart Hauptmann with his grim tragi-comedy of the Berlin stage-and-slum-world *Ratten*. Hugo von Hofmannsthal's *Rosenkavalier* attained a measure of celebrity through the music of Richard Strauss, who made the daring little comedy into a light opera. Arthur Schnitzler's powerful picture of life in the Viennese smart set, *Das weisse Land*, grips by its grim irony. Hermann Bahr's *Die Kinder* is not likely to have the success of *The Concert*. Other ambitious plays in prose and verse that saw their initial performance during the year were Wilbrandt's posthumous *Siegfried der Cherusker*, Eduard Stucken's sonorous *Lancelot*, Hans Kyser's *Medusa*, Paul Ernst's *Brunhild*, Herbert Eulenberg's *Anna Walewska*, and the *Achill*, by Ernst Rosmer, the author of *Königskinder*. Joseph Rueder has once more raised hopes of future achievement by his *Schmied von Kochel* and Max Dauthendey by a very effective play based upon the life of Catharine of Russia, *Spieldereien einer Kaiserin*. Otto Gysae struck a new note in his comedy *Höhere Menschen*; Ludwig Thomas scored another success by the robust Bavarian humor of *Lottchens Geburtstag* and a dream-play by Paul Apel, *Hans Sonnenstrasser's Höllenfahrt* profoundly impressed the critics. Among dramas so far only known in book form, Carl Hauptmann's *Napoleon Bonaparte*, a dramatic poem in two parts, is distinguished more for its psychology and its poetry than for dramatic construction. The greatest box office receipts went as usual to the men who have for many years controlled the market for comedy and farce. When the records for the year 1910 were closed, it was found that the operetta kings, Fall and Lehar, had as many performances to their credit as all the classical and modern dramatists taken together; no doubt the result of the year 1911 will be the same.

POETRY. Among the poetical productions of the year Wilhelm Schmidtbönn's *Lobgesang des Lebens*, ranks first, through both the same and strong spirit as the fire and sweep of its rhythms. Another book of verse standing apart from the average by a rare dignity and depth of sentiment is entitled *Vigilien*, by Albert H. Rausch. Börries Freiherr von Münchhausen, acknowledged master of the modern "Ballade"

which for several decades had been sadly neglected by German poets, has published two volumes of *Neue Balladen und Lieder* and *Das Herz im Haraisch*, which justify the high esteem in which he is held. One of the women poets who some years ago attracted much attention by the vitality of her topics and the frankness of their treatment, Margaret Beutler, has sent out a new book of verse which indicates that she has entered upon a new phase of her development, though it might have been suggested by a better title than *Leb wohl, Bohème!* Christian Morgenstern is one of the few poets who, in spite of a productivity which would have long exhausted the average fund of poetic inspiration, manage to retain an individual distinction in both matter and manner, of which his sonnets *Ich und Du* are an admirable example. Rudolf Presber has published a new volume called *Und all' die Kränze*; Gustav Falke has edited a volume of selections from his poems; Maurice Reinhold von Stern strikes in his *Wildfeuer* notes familiar to readers of his verse; Else Lasker Schüller, one of the most gifted women poets of the country, has written a volume of verse called *Mein Wunder*, and Maria Janitschek has published a collection of her poems. Heinrich Spiere's *Dichtungen* are of the same serious and noble calibre as his prose works. Carl Albrecht Bernoulli figures as the author of that rare phenomenon among works of modern poetry, an epic, called *Odyseus*. The posthumous book of verse by Otto Julius Bierbaum *Die Schatulle des Grafen Thummel* is full of the charm of his humor and his pathos.

ESSAYS, TRAVEL, HUMOR, ETC. The quantity of books of essays and treatises on various subjects that have been published during the past year is bewildering. Adolf Harnack's *Aus Wissenschaft und Leben* is a scholarly and stimulating volume. Lady Charlotte Blennerhassett's *Streiflichter* is both illuminating and fascinating. Oskar Walzel presents a valuable contribution to the history of recent intellectual development in the book called *Vom Geistesleben des 18. und 19. Jahrhunderts*. Franz Blei, the most brilliant, though, perhaps, not always the most profound essayist of modern Germany, has published two volumes of miscellaneous writings. *Vermischte Schriften*, Hermann Bahr, appears once more as essayist in a book bearing the significant title *Austriaca*. Fritz Wittels is the author of a clever book entitled *Tragische Motive*. Among works of travel Norbert Jacques has published a most fascinating volume of Brazilian impressions called *Hiesse Städte*. Hans Heinz Ewers, always emphatically personal, calls his book of Indian travel *Indien und ich*. Oscar Kauffmann is more conventional and likely to reach a wider audience by his sumptuously illustrated volume, *Aus Indiens Deckungen*. A book of readable American impressions is Freiherr Hans von Barnekow's *Was ich in Amerika fand*. Dr. R. Weeside revives the memory of Fritz Reuter in his book *Aus dem Lande Fritz Reuters*, which deals with the speech and manners of Mecklenburg people. Ewald Gerhard Seeliger has collected some tales and jests of Silesian lore in a volume called *Zwischen Polen und Böhmen*. The unabated popularity of Wilhelm Busch is proved by the appearance of the twenty-second edition of the *Busch-Album*.

HISTORY, BIOGRAPHY, ETC. A valuable work on general history is the *Reptitorium der Ges-*

chichte in three volumes, of which the one covering antiquity has just appeared: *Altertum*, by Dr. A. Beckstadt. Of the *Illustrierte Sittengeschichte*, by Eduard Fuchs, two volumes have so far been published, covering the *Renaissance* and *Die galante Zeit*. Dr. H. Pantenius is the author of a comprehensive work on the history of Russia, *Geschichte Russlands*. Dr. Friedrich Schulze appears as the author of two historical works interesting to German readers, *Die Franzosenzeit in deutschen Landen 1806-15*, and with Dr. Paul Symmack as collaborator, *Das deutsche Studententum von den ältesten Zeiten bis zur Gegenwart*. William Kauffman has added to the annals of the Germans in America by his book *Die Deutschen im amerikanischen Bürgerkriege*. Of biographies there has been an amazing quantity. A new Bismarck book is Gottlob Egelhaaf's *Bismarck—sein Leben und sein Werk*. Wagner's *Autobiography* has been supplemented by the simultaneous appearance of Ferdinand Pfuhl's *Richard Wagner—sein Leben und sein Schaffen* and the fourth volume of F. Glase-napp's life of Wagner. Among the numerous books referring to Goethe days in Weimar are several biographies of merit: Wilhelm Bode's *Charlotte von Stein* and Ida Boy-Ed's *Charlotte von Kalb*, and a volume of letters by Johann Friedrich Merck to the Princess Amalia and Karl August. A volume of letters by Wilhelm von Humboldt to Schiller completes this group. Sigmund Rahner has contributed to Kleist biography by his *Heinrich von Kleist als Mensch und Dichter*, Ernst Schur presents *Heinrich von Kleist in seinen Briefen*. A noteworthy life of Lenau has been compiled from letters, diaries, and other material, and is called *Ein Kampf ums Licht*. Under the title *Briefe aus dem Vormärz*, an interesting volume is made up of letters addressed to Moritz von Hartmann by his contemporaries. A book of letters, diaries, and speeches by Ferdinand Lassalle has appeared. Lily Braun continues the record of her interesting career in the *Memoiren einer Sozialistin*. Another valuable book of memoirs is Friedrich Spielhagen's *Erinnerungen aus meinem Leben*. Other memoirs and letters are concerned with Lessing Heine, Platen, Uhland, and Nietzsche.

LITERATURE, CRITICISM, ETC. A very curious feature of the present is the abundance of brief monographs appreciative of contemporaries of varying rank. A whole literature has grown up about Gerhart Hauptmann, there have been studies of Schnitzler, Hoffmannsthal, Henckell, Carl Hauptmann, and many others. More justified seem the books devoted to writers that have recently died and really said their last word, as Hermann Anders Krüger's *Der junge Raabe* and Dr. Heinrich Spiero's *Wilhelm Raabe*. There has also appeared a book on *Gottfried Keller als lyrischer Dichter* by Gustav Müller-Gschwend. Heinrich Spiero's *Deutsche Geister* is an important contribution to the study of modern German letters. Dr. Wolfgang Golther writes interestingly on German lore and music in his book *Aus deutscher Sage und Dichtung*. One of the most complete and sympathetic histories of the Young Germany which was such a powerful ferment in the intellectual life of Germany after the stagnation and reaction of the Napoleonic period is J. J. Houben's *Jungdeutscher Sturm und Drang*. Albert Soergel has published a volume called *Dichtung und Dichter der Zeit*. Of Alexander

Baumgarten's history of the world's literature the sixth volume has been published and is devoted to Italy. Dr. Carl Weiser has written a history of English literature. Karl Dietrich is the author of a book covering a large ground, *Die osteuropäischen Literaturen*. Dr. Arthur Horbach has written a history of French literature. Of Max Koch's *Geschichte der deutschen Literatur* the seventh edition has appeared. Interesting books on art are Karl Scheffler's *Deutsche Maler und Zeichner in 19. Jahrhundert*, Wilhelm Bode, the indefatigable worker on the subject of Goethe, has traced the relation of Goethe to the musicians of his time in *Die Tonkunst in Goethes Leben*. Among books of folklore the year has had a collection of Chinese love-and-ghost-stories and one of Byzantine legends. Dr. Otto Henne am Rhyn is the author of a popular and illustrated *Religions und Sittengeschichte aller Zeiten*.

Sociology comes in for a larger share every year. One of the most noteworthy books on that subject is Otto Rühle's *Das proletarische Kind*. Under the collective title *Die Gesellschaft* appear brief monographs on sociological, economic, and other problems written by authorities like George Simmel and Albrecht Wirth and by others.

Bewildering is the large number of translations. The German translator seems to scour the globe in quest of old and new works and seems to find a publisher far more readily than the American author who attempts a translation. Of new editions of standard works it is almost impossible to keep track, since every large publishing house, like S. Fischer, the Insel-Verlag, the Xenien-Verlag, Eugen Diederichs, Albert Langen, Egon Fleischel & Company, and many others undertake the reissue of classical authors with their imprint.

Death has removed a number of German writers. Those whose loss is likely to be most deeply felt were Friedrich Spielhagen, the Nestor of German fiction and a link between the Young Germany of the thirties and that of the eighties; Martin Greif, poet and dramatist; Johannes Pröls, poet, dramatist, novelist, and essayist; Wilhelm Dilthey, philosopher and historian; Richard Weitbrecht, with his brother Karl, the author of a German literature of the nineteenth century; Dr. Bernard Suphan, the director of the Goethe-Schiller-Archiv in Weimar and Anton E. Schönbach, a critic and historian.

GERMAN MUSIC. See MUSIC.

GERMAN NAVY LEAGUE. See GERMANY, *History*.

GERMAN NEW GUINEA, or KAISER WILHELM LAND. A German protectorate, occupying the northeastern portion of the island of New Guinea. Area, about 70,000 square miles. Native population estimated at 110,000; whites (1909), 197. Imports (1909), 2,605,942 marks; exports, 2,458,844 (mostly copra). Vessels entered (1909), 691, of 419,772 tons. The budget (1910-11) balanced at 1,480,000 marks (including imperial subvention, 615,000). Governor (1911), Dr. Hahl, residing at Herbertshöhe in the Bismarck Archipelago. The (German) Caroline Islands, the Bismarck Archipelago, the Ladrone, the German Solomon, and the Marshall Islands (q. v.), are attached administratively to German New Guinea.

GERMAN POETRY. See GERMANY LITERATURE.

GERMAN SAMOA. A German possession in the South Pacific. The island of Savaii has an area of 600 square miles; Upolu, 340. Total population (1910), 34,480 (white, 473; Chinese, 1334). In 1909 the imports amounted to 3,337,629 marks and the exports to 3,021,379 (chiefly copra); 123,775 tons entered at the ports. The revenue and expenditure were estimated to balance (1910-11) at 932,000 marks. Apia, in Upolu, is the residence of the governor. The governor in 1911 was Dr. Solf, until November, when he was appointed imperial secretary of state for the colonies.

GERMAN SOLOMON ISLANDS. A German possession, consisting of the islands of Bougainville and Buku (containing 4500 square miles and having a population of about 45,000) attached administratively to German New Guinea.

GERMAN SOUTHWEST AFRICA. A territory south of Angola, containing an area of 318,000 square miles and belonging to Germany. Population, about 200,000 (Europeans, 1910, 12,935). The most important industry is stock raising. Livestock (1910), 121,139 cattle, 343,989 sheep, 10,661 horses, 6064 mules, 6629 asses, 8095 angora and 319,000 other goats, 5208 swine, 954 camels. Value of diamonds from the Lüderitz Bay mines in 1909, 15,400,000 marks; copper ore exported, 31,497 tons. Imports, (1909), including government stores, 34,713,448 marks (cereals and flour, iron and iron work, textiles, beer, timber, tobacco, preserved meat); exports, 22,070,904 (guano, copper ore, diamonds, etc.). Germany furnished imports valued at 26,389,785 marks and received exports valued at 18,157,767. Railways open, 994 miles. Post offices, 62. The budget (1910-11) balanced at 34,998,000 marks, including imperial subvention, 11,416,000 marks. Governor (1911), Dr. Seitz, with headquarters at Windhoek.

GERMAN TRADE UNIONS. See TRADE UNIONS.

GERMAN UNIVERSITIES. See UNIVERSITIES AND COLLEGES.

GERMANY. An empire of Europe extending from France to Russia. Capital, Berlin.

AREA AND POPULATION. The area in square miles and the population by states, according to the census of December 1, 1905 (in thousands) and according to the census of December 1, 1910, are shown in the following table (*k*=kingdom, *g* grand duchy, *d*=duchy, *p* principality, *f. t.*=free town, *r*=Reichsland).

States	Sq. mi.	Pop. '05	Pop. '10
Prussia (k).....	134,616	37,294	40,165,219
Bavaria (k).....	29,292	6,524	6,887,291
Württemberg (k).....	7,534	2,302	2,437,574
Saxony (k).....	5,789	4,509	4,806,661
Baden (g).....	5,823	2,011	2,142,833
Meck'burg-Schwerin (g).....	5,068	625	639,958

Schwarzburg-Sondershausen (p).....	333	85	89,917
Reuss Younger Line (p).....	319	145	152,752

States (cont.)	Sq. mi.	Pop. '05	Pop. '10
Hamburg (f. t.).....	160	875	1,514,664
Schaumburg-Lippe (p)...	131	45	46,652
Reuss Elder Line (p)...	122	71	72,769
Lübeck (f. t.).....	115	106	116,599
Bremen (f. t.).....	99	263	299,526
Alsace-Lorraine (r).....	5,604	1,815	1,874,014
Total	208,780	60,641	64,925,993

Of the total in 1910, 32,040,166 were males and 32,885,827 females. The population of the empire in 1871 was 41,058,792; in 1880, 45,234,061 (average annual increase from 1871 to 1880, 1.08 per cent.); 1890, 49,428,470 (0.89 per cent.); 1900, 56,367,178 (1.31 per cent.); 1910, 64,925,993 (1.41 per cent.).

Population of the provinces of Prussia (1910): East Prussia, 2,064,175 (56 per square kilometer; West Prussia, 1,703,474 (67); Brandenburg, 4,092,616 (103); Pomerania, 1,716,921 (57); Posen, 2,099,831 (72); Silesia, 5,225,962 (130); Saxony, 3,089,275 (122); Schleswig-Holstein, 1,621,004 (85); Hanover, 2,942,436 (77); Westphalia, 4,125,096 (204); Hesse-Nassau, 2,221,021 (141); Rhenish Prussia, 7,121,140 (264); Hohenzollern, 71,011 (62); city of Berlin, 2,071,257; total, 40,165,219 (115).

Complete returns of the 1910 census in respect of religious adherence are not yet available. Figures for some of the states are as follows:

	Prot.	R. Cath.	Jews	Other
Prussia	24,830,908	14,581,604	415,867	336,840
Bavaria	1,942,386	4,862,233	55,065	27,008
Württ'bg	1,671,183	739,995	26,390
Baden	821,228	1,270,782	25,896	24,927
Hesse	848,116	397,534	23,993	11,408
Alsace-Lor. ..	391,067	1,387,462	31,708	4,327

In 1909 the number of marriages was 497,127, of births, 2,038,357, of deaths, 1,154,296, of stillbirths, 60,079, of emigrants, 24,921, and of emigrants to the United States, 19,930.

In 1910 German emigrants numbered 25,531 (to the United States 22,773, Canada 460, Brazil 333). Foreigners emigrating by German ports in 1908, 106,499; 1909, 249,637; 1910, 254,618.

The larger cities, with population, including the military, December 1, 1910; Berlin, 2,071,257 (1,888,848 in 1900, 1,578,794 in 1890, and 826,341 in 1871); Hamburg, 931,055; Munich, 596,467; Leipzig, 589,850; Dresden, 548,308; Colognd 516,527; Breslau, 514,765; Frankfort-on-the-Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charottenburg, 305,978; Hanover, 302,375; Essen, 294,653; Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsburg, 245,994.

EDUCATION. Education is free and compulsory and the number of illiterates is almost negligible. In 1909 the proportion of illiterates among the army recruits was .02 per cent. Elementary schools (1906); Public, 80,584, with 166,597 teachers (29,384 women), and 9,737,262 pupils; private, 614, with 42,094 pupils. Secondary schools (1908): Public, 1405, including 226 normal schools; private, 56. There are 11 state-aided, degree-conferring technical high schools, with (1910) 753 teachers and 16,072 students. In addition there is a large number of institutions for various special or technical instruction. The 21 German universities had in the summer semester of 1910 54,845 matriculants (of whom 2169 women); in addition 3906 non-matriculated (1220 women). Matriculants in 1911, 54,962 (2552 women), as compared with 51,700

in 1909 and 33,700 in 1900. Matriculants at Berlin in 1911, 8039; Munich, 6890; Leipzig, 4592; Bonn, 4070; Freiburg, 2884.

AGRICULTURE. In 1900, 48.6 per cent. of the total area was under cultivation, 16 per cent. was meadow and pasture, and 26 per cent. was forest. In 1907, 27.95 per cent. of the population was supported by agriculture, against 34.9 per cent. in 1895. At the same time there were 5,736,082 farms, the total area being 78,665,370 acres, an average per farm of about 13.7 acres. There were 2,731,055 farms containing less than 1 hectare (2.47 acres); 2,306,529 contained 1 to 10 hectares; 674,932 from 10 to 100 hectares; 23,197 from 100 to 1000 hectares; and 369 contained over 1000 hectares. The farms held by the peasantry comprise 69 per cent. of the total area, other small holdings 5.5 per cent., and the large estates 25.5 per cent. It is estimated that 88 per cent. of the land tilled by peasant farmers is owned by them. The area and yield of leading crops are shown below for two years (1911 yield preliminary), with yield per hectare in 1910 (*w* = wheat, *r* = rye, *b* = barley, *o* = oats):

Crops	Hectares		Quintals*		Qs. per ha.
	1910	1911	1910	1911	
w	1,942,916	1,974,197	38,614,790	40,663,350	19.9
r	6,186,775	6,135,617	105,111,600	108,661,160	17.0
b	1,570,435	1,585,049	29,029,380	31,599,150	18.5
o	4,289,387	4,327,791	79,003,760	77,041,010	18.4

* Metric quintals (220.46 lbs.).

Other yields, in 1909 and 1910 respectively, in metric tons (2204.6 lbs.): Potatoes, 46,706,252 and 43,468,395; meadow hay, 22,140,927 and 28,250,115; clover, 8,956,696 and 11,943,657; alfalfa, 1,352,896 and 1,658,219; hops (in 1910), 6054; tobacco, 28,178. Wine production (1910), 2,020,620 hectoliters. The sugar beet is an important crop, and large quantities of sugar are produced and refined. Livestock, December 2, 1907: Horses, 4,345,043; cattle, 20,630,544; sheep, 7,703,710; swine, 22,146,532; goats, 3,533,970.

MINERALS AND METALS. Figures for mineral and metal production include those of the Grand Duchy of Luxemburg. The total value of minerals raised in 1909 was 1981 million marks, against 1971 million in 1908, 1845 in 1907, and 1637 in 1906. The quantities of the principal minerals raised are shown in the following table in metric tons:

Minerals	1907	1908	1909
Coal	143,185,691	147,671,149	148,899,745
Lignite	62,546,671	67,615,200	68,533,743
Iron ore	27,697,128	24,278,151	25,505,409
Zinc ore	698,425	706,441	723,365
Lead ore	147,272	155,861	159,852
Copper ore	771,227	727,384	798,618
Rock salt	1,285,138	1,331,984	1,370,668
Potash salts	5,749,368	6,099,022	7,041,173
Other products .	534,298	552,351	528,662

The more important reduction products are reported in metric tons in 1908 and for 1909 (provisional) as follows: Pig iron, 11,805,320 and 12,625,575; zinc, 216,490 and 219,766; lead, 164,079 and 167,920; copper, 30,001 and 31,126; tin, 6374 and 8994; silver, 407 and 401; sulphuric acid, 1,391,653 and 1,434,709.

COMMERCE. The special trade (imports for

consumption and exports of domestic products) is shown in the following table in thousands of marks:

	1908	1909	1910
Imports:			
Merchandise	7,664,021	8,520,125	8,934,126
Coin and bullion..	413,072	340,285	375,866
Total	8,077,093	8,860,410	9,309,992
Exports:			
Merchandise	6,398,527	6,592,242	7,474,661
Coin and bullion..	82,926	266,451	169,537
Total	6,481,453	6,858,693	7,644,198

Imports and exports of merchandise, in millions of marks, have been as follows, by great classes—food substances (a), live animals (b), raw materials (c), manufactures (d), totals, (e):

	Imports of mdse.			Exports of mdse.		
	1908	1909	1910	1908	1909	1910
a ..	2,042.6	2,324.3	2,215.7	679.8	662.3	751.2
b ..	224.6	231.1	267.2	9.5	11.1	9.8
c ..	4,154.2	4,688.9	5,083.3	1,577.2	1,701.9	1,918.1
d ..	1,242.6	1,275.8	1,367.9	4,182.1	4,216.9	4,795.5
e ..	7,664.0	8,520.1	8,934.1	6,398.6	6,592.2	7,474.7

Principal articles of merchandise entered for consumption in 1910, in millions of marks (figures in parenthesis for 1909): Cereals, 887.0 (962.0); cotton, 601.2 (568.0) hides and skins, 545.2 (492.5); wool, 504.3 (466.2); rubber and gutta-percha, 296.6 (153.0); timber, etc., 288.1 (252.6); live animals, 263.9 (238.4); coal, 243.6 (260.2); copper, 216.2 (194.8); chemicals and drugs, 205.1 (287.7); silk, 181.7 (193.9); coffee, 176.6 (188.2); fruits, 176.2 (177.0); iron, 170.9 (135.9); copra, etc., 170.9 (116.6); eggs, 163.2 (156.6); woolen yarn, 119.5 (119.7); fish, 106.9 (95.5); leaf tobacco, 104.1 (132.1); wheaten products, 102.8 (127.5); cotton yarn, 102.1 (89.5); linseed, 100.8 (105.7); oil cake, 92.8 (98.3); butter, 90.5 (96.5); iron manufactures, 81.7 (64.6); silk goods, 81.5 (69.5); rice, 80.3 (59.2); wine, 71.6 (47.3); tin, 70.5; flax and hemp, 70.2 (78.1); animal fats, 69.4 (111.4); machinery, 64.3 (63.5); furs, etc., 59.5 (63.3); petroleum, 56.8 (65.7); cotton goods, 56.5 (53.5).

Principal domestic exports in 1910, in millions of marks (figures in parenthesis for 1909): Iron manufactures, 810.3 (694.9); machinery, 459.9 (384.4); chemicals and drugs, 450.3 (380.9); coal, 444.6 (413.0); cotton goods, 374.8 (321.7); cereals, 314.7 (255.9); woolen goods, 263.3 (255.5); dyes, colors, etc., 246.3 (231.2); electrical apparatus, 218.2 (180.9); paper, 217.4 (200.3); sugar, 196.3 (207.3); leather, furs, etc., 167.9 (142.1); hides and skins, 149.1 (136.3); copper manufactures, 140.0 (114.6); ships, 123.8 (117.6); wool, 115.2 (111.1); apparel, 103.8 (87.7); glass and glassware, 99.2 (90.0); books, maps, etc., 97.1 (61.8); cotton, 87.7 (70.3); toys, 86.1 (76.1); pottery, 85.3 (76.1); leather manufactures, 78.5 (74.3); woolen yarn, 77.5 (109.7) musical instruments, 62.8 (56.3); gold and silver manufactures, 49.6 (70.7).

Trade with the countries commercially most important, in millions of marks (exclusive of coin and bullion) is shown in the following table:

Countries	Imports		Exports	
	1909	1910	1909	1910
United States	1,262.6	1,187.6	606.3	632.7
Russia	1,304.3	1,322.2	435.2	537.3
Great Britain	723.2	766.6	1,015.0	1,102.0
Austria-Hungary ..	754.7	759.2	767.3	821.6
France	485.1	508.8	455.1	643.4
British India	317.0	404.6	78.8	89.8
Argentina	437.7	357.2	175.4	240.2
Belgium	289.6	325.6	348.7	390.7
Brazil	234.3	278.9	91.8	121.4
Italy	287.9	274.5	289.0	323.5
British Australasia.	233.1	267.9	58.4	63.3
Netherlands	253.4	258.5	453.5	498.7
Dutch East Indies..	184.9	187.5	39.5	49.8
Switzerland	162.6	173.9	413.2	452.6
Sweden	141.8	163.8	156.2	190.5
Denmark	135.3	158.1	195.7	224.7
Chile	143.5	154.6	67.6	64.8
Spain	123.7	140.2	69.1	71.6
British West Africa	87.4	108.3	11.7	15.2
China	65.2	94.7	56.8	66.5
Egypt	95.7	93.6	32.2	34.2
Rumania	64.5	68.9	57.2	65.7
Norway	36.8	49.7	104.5	119.9

Imports, in millions of marks, from the German colonies in 1909 and 1910, 20.3 and 40.0; exports, 40.9 and 49.0.

SHIPPING. The following table shows the total vessels and the steamers entered and cleared, with registered tonnage, in 1909:

	Entered		Cleared	
	Vessels	1000 tons	Vessels	1000 tons
German	85,629	16,683	86,084	16,782
Foreign	23,896	11,783	24,152	11,902
Total	109,525	28,466	110,236	28,684
	Steamers ent.		Steamers cl.	
	Vessels	1000 tons	Vessels	1000 tons
German	57,674	14,458	57,702	14,556
Foreign	14,732	10,842	14,857	10,979
Total	72,406	25,299	72,559	25,535

The merchant marine, January 1, 1911, included 4675 sea-going vessels of 2,903,570 tons, of which 1973 of 2,396,733 tons were steamers.

COMMUNICATIONS. The railway lines in operation under government ownership or management and the total private lines were as follows on March 31, 1911 (normal gauge, narrow gauge, and totals, in kilometers—one kilometer=.62137 mile);

	Norm. g.	Nar. g.	Total
Owned or operated by:			
Prussia and Hesse.....	37,562	240	37,802
Bavaria	7,853	110	7,963
Saxony	2,809	476	3,285
Württemberg	1,938	101	2,039
Baden	1,721	28	1,749
Mecklenburg	1,099	...	1,099
Oldenburg	649	...	649
Prussia (Royal Military Railway).....	71	...	71
Imperial government in Alsace-Lorraine	2,020	78	2,098
Government lines.....	55,722	1,033	56,755
Private lines.....	3,537	1,145	4,682
Total kilometers.....	59,259	2,178	61,437

The foregoing totals stated in miles are:

Government lines	34,624	642	35,266
Private lines	2,198	711	2,909
Total miles	36,822	1,353	38,175

The electrification of the Leipzig-Bitterfeld and Magdeburg line was in progress during the year and the Bitterfeld-Dessau section, 18 miles in length, was the first to be undertaken. Electric locomotives will be used on this line. The monorail line based on the Scherl and Brennan systems from Bad-Homburg to Frankfurt-on-the-Main was under construction, and the electric line between Bavaria and Tyrol over the Mittenwald almost completed.

Telegraphs are owned by the imperial government except in Bavaria and Württemberg, which states, under certain limitations, administer their own posts and telegraphs. Total telegraph offices (1910), 45,116, with 224,794 kilometers of line and 676,091 of wire. Total post offices (1910), 40,816.

FINANCE. The unit of value is the mark, worth 23.8 cents. The budget for the year ending March 31, 1912 (law of April 7, 1911), balanced at 2,924,790,065 marks (including extraordinary revenue and expenditure balancing at 216,975,817 marks). Larger items of estimated ordinary revenue: Customs, excise, stamps, etc., 1,482,873,300 marks (customs 638,291,000, spirits excise 163,476,000, sugar 151,919,000, beer 123,462,000); posts and telegraphs 734,161,600; railways, 128,893,000; matricular contributions of the several states, 212,004,700 (Prussia 131,858,385, Bavaria 21,011,037, Saxony 15,933,768). Of the extraordinary receipts, loans accounted for 97,500,006 marks. Larger estimated expenditures, including ordinary (permanent and transitory) and extraordinary: War, 815,670,790 marks; posts and telegraphs, 684,606,385; navy, 458,033,686; imperial treasury, 205,311,278; imperial debts, 285,748,054; pensions, 153,798,446; interior, 140,843,167; railways, 122,499,005.

At the end of 1910, the interest-bearing debt of the empire was 4,896,633,500 marks, having increased 643,133,500 marks in two years. Non-interest-bearing debt: Treasury bonds, 246,000,000 marks, having decreased 347,000,000; paper money, 120,000,000. Total debt, December 31, 1910, 5,262,633,500, as compared with 4,966,500,000 December 31, 1908, and 4,597,500,000 December 31, 1907. The invested fund for invalids amounted to 35,478,400 marks March 31, 1911. A war fund of 120,000,000 marks in gold is kept at Spandau.

ARMY. The Germany army is recruited by conscription, every citizen, with certain exceptions, being liable for service from his nineteenth through his forty-fifth year. Seven years are spent in the regular army either with the colors or in its reserve, five years in the first levy of the Landwehr, then ten years in the second levy, and finally with the Landsturm or Home Defense Army, until the end of the fifty-fifth year. These periods are modified somewhat in the case of the cavalry and horse artillery, and an Ersatz Reserve is maintained from the surplus of recruits over those required for the regular army. The army was organized into twenty-three corps, including three Bavarian corps and a corps of guards.

The quinquennial army bill of 1911 was adopted by the Reichstag on March 7, and became a law on April 1. In accordance with the quinquennial law of 1905 the peace strength had to be raised to 505,889 rank and file by 1910. This total under the law of 1911 was to be increased gradually to 515,321 by 1915, or an increase of 9428, exclusive of non-commissioned

officers, and was then to remain at that figure until the expiration of the term of five years, at the end of March, 1916. By that time the non-commissioned officers, who were in large part responsible for training the recruits and developing the army, would number over 90,000, while the one-year volunteers serving in the ranks would number some 14,000; therefore, the German army would have a net minimum total of 625,000 men. The apportionment would distribute the troops furnished as follows: Prussia, 399,026; Bavaria, 57,133; Saxony, 38,911, and Württemberg, 20,251.

The bill provided for the formation of 10 new machine-gun companies, 18 field batteries, 4 battalions, and 7 companies of foot artillery, 2 new airship battalions, and a battalion of motor transport troops, besides minor increases in other arms. The establishment of horses was to be increased by more than 4000, i. e., from 114,162 to 118,246, and of this increase 2376 were required for the machine-gun companies and 1715 for the field artillery. The sum of 3,000,000 marks was allotted for strengthening the fortress of Königsberg on the Russian frontier; and 1,600,000 marks for improving land fortifications, and 2,680,000 marks towards the fortress construction at Cologne.

A new regiment of foot artillery was to be established by developing the second regiment of artillery. The chief commands of the railway troops were to be reorganized, and an increase was also to be made in the effective strength of the horses of the field artillery. An attempt was to be made to increase the number of the camps of instruction. The German army had maintained twenty-six of these camps of instruction from the beginning of March to the end of October in each year. Military critics in Europe considered that these camps were far more useful in developing preparedness for war than the wealth of equipment of high technical grade that was being gradually added to the German army.

NAVY. The number and displacement of warships, built and building, of 1000 or more tons, and of torpedo craft of 50 or more tons, on December 1, 1911, are reported as follows: 7 dreadnoughts of 141,720 tons built, and 9 of 217,400 tons building; 21 first-class battleships of 252,712 tons built; 5 coast-defense vessels of 20,273 tons built; 2 battleship cruisers (armored cruisers of *Invincible* type) of 41,637 tons built, and 3 of 72,650 tons building; 9 armored cruisers of 94,245 tons built; 24 cruisers (6000 to 3000 tons) of 98,180 tons built, and 6 of 32,650 tons building; 15 cruisers (3000 to 1000 tons) of 34,528 tons built; 109 torpedo-boat destroyers of 58,474 tons built, and 12 of 9000 tons building; 22 torpedo boats of 3790 tons built; 14 submarines of 4140 tons built, and 10 of 6000 tons building; total tonnage built, 749,699; building, 337,700. The foregoing list does not include transports, colliers, repair ships, converted merchant vessels, etc., vessels over twenty years old, unless reconstructed and rearmed since 1905, and vessels not actually begun or ordered although authorized. The main batteries of the 7 dreadnoughts built aggregate 36 12-inch and 48 11-inch guns; of the 21 first-class battleships built, 46 11-inch and 40 9.5-inch guns; of the 2 battleship cruisers 18 11-inch guns. Of the 7 dreadnoughts built, 2 were completed in 1909, 2 in 1910, and 3 in 1911. Those building (December 1, 1911),

are the *Oldenburg* (launched June 30, 1910), *Kaiser* (launched March 22, 1911), *Friedrich der Grosse* (launched June 10, 1911), *Ersatz-Hagen* (launched November 11, 1911), *Ersatz-Egir*, and *Ersatz-Odin* (both laid down in the fall of 1910), and 3 ordered in August, 1911. The principal characteristics of the new German dreadnoughts completed may be seen in the following specifications of the *Helgoland*, launched in September, 1909, and completed in August, 1911: designed speed, 21 knots; displacement, 22,440 tons; length between perpendiculars, 515 ft.; beam, 92 ft.; draft, 27 ft.; battery 12 12-inch and 14 6-inch guns; torpedo tubes, 6; maximum thickness of armor belt, 9¾ in.; complement, 980. The battleship cruiser *Moltke*, launched in April, 1910, and completed in September, 1911, has a designed speed 26 knots (29½ reported at trials); displacement, 22,637 tons; length between perpendiculars, 610 ft.; beam, 96½ ft.; draft, 27 ft.; battery, 10 11-inch and 12 6-inch guns; torpedo tubes, 4; maximum thickness of armor belt, 10 in. The battleship cruiser *Goeben* was launched March 28, 1911. Total personnel, 3038 officers, etc., and 61,091 men. Budget estimate for the navy, year ending March 31, 1911, 442,176,282 marks; 1912, 458,033,686 marks.

GOVERNMENT. The imperial chancellor in 1911 was Theobald von Bethmann-Hollweg (from July, 1909). The imperial ministers, or secretaries of state, were: Foreign affairs, Alfred von Kiderlen-Waechter; interior, Klemens Delbrück; navy, Grand Admiral Alfred von Tirpitz; justice, Hermann Lisco; treasury, Adolf Wermuth; posts and telegraphs, Reinhold Kraetke; colonies, Friedrich von Lindequist. On account of dissatisfaction with the Franco-German treaty of November 5, 1911, von Lindequist resigned; he was succeeded by the governor of German Samoa, Dr. Solf. In May, 1911, a constitution for the Reichland, providing a certain measure of representative government, was adopted by the Reichstag. The constitution bears date of May 31, 1911.

HISTORY

PARLIAMENT. The chief subjects before the Reichstag during the winter and spring sessions were the Alsace-Lorraine constitution and franchise bills and the workmen's insurance-consolidation and amendment bill. In carrying through these measures, the former with some important amendments and the latter with scarcely any change, the government scored two substantial successes (see the following paragraphs). On January 31, the Reichstag passed the increment tax bill presented in the previous year. It taxed such increment in the value of the property as was not due to the agency of the owner, at rates ranging from 10 per cent. on increments not exceeding 10 per cent. of gross purchase price to 30 per cent. on increments exceeding gross purchase price by 290 per cent. In February the naval and war budgets were under consideration. By the end of that month the chief clause of the new army bill, providing for an annual increase during the next five years, was carried by a large majority, the opposition consisting of Poles, Socialists, and three members of the Centre. The debate on the second reading of the navy estimates brought out a remark from Admiral von Tirpitz expressing surprise at England's mistake in saying or

thinking that the building of the German navy had been hastened beyond the provisions of the Navy law. He declared that, as a matter of fact, not a penny had been collected for that purpose. On March 30, the chancellor made an important address in regard to the limitation of amendments.

He declared that he had not seen any intelligible or detailed proposal as to disarmament which was worthy of serious discussion. In the first place, if the great powers desired an agreement about an international disarmament they must decide on the position which the several nations should have in relation to one another. In other words, they must arrange a sort of precedence list. He said, "England is convinced and has declared that, notwithstanding all her wishes for a limitation of armaments and for the composition of disputes by arbitral procedure, her fleet must in all circumstances be a match for, or even superior to, any possible combination in the world." As to courts of arbitration, he said: "International treaties embracing the whole world and imposed by a world congress I consider to be as impossible as general international disarmament." He concluded with the remark that the condition of peaceableness is strength. When a people will not or cannot continue to spend enough on its armaments to be able to make its way then it falls back into the second rank. Outside Germany these remarks occasioned much adverse criticism in the press.

THE ALSACE-LORRAINE CONSTITUTION. In the summer of 1910 the government announced that it had decided upon a measure for according a constitution to Alsace-Lorraine. This measure, as formulated by the government and passed by the Bundesrath, made the territory autonomous, but left it in the status of a province without representation in the Bundesrath, and under the control of the emperor. On January 28, 1911, the constitution and franchise bills for Alsace-Lorraine were read for the first time in the Reichstag and were sent to a special committee. The franchise measure provided for the election of the lower chamber by universal suffrage, with plural voting for the older citizens. The government had desired to placate the democratic element by the introduction of a liberal electoral system and at the same time hold the reactionaries by excluding the province from representation in the Bundesrath. But the democratic element in the Centre demanded not only a democratic electoral system, but a footing of equality with the other states of the empire. They were joined in this by the Liberals and Socialists. The committee in charge of the measures adopted amendments placing Alsace-Lorraine in the rank of an independent federal state with three votes in the Bundesrath, and providing for the appointment of a governor for life by the emperor on the nomination of the Bundesrath. The government consented to allow Alsace-Lorraine three votes in the Bundesrath, but only on condition that these votes should be counted against Prussia, and not for her, since the governor for life was to be nominated by the emperor, who was King of Prussia. The Socialists were won over to this compromise measure by its provision for universal suffrage and the direct secret ballot, and the bill passed its second reading on May 24 by a majority composed of the Centre, the Liberals, and Socialists, while the Conserva-

tives voted against it. A significant feature of the affair was the recognition by the government of the Socialistic party, hitherto condemned as revolutionary, republican, etc., and its appeal to it to collaborate in an important legislative undertaking. This alliance between the government and the Socialists led to some sharp criticism by the Conservatives. The government was taunted with having received the measure as a gift from the Socialists. The grant of universal suffrage to Alsace-Lorraine was regarded as having an important bearing on the question of the Prussian franchise, for the inconsistency of the government's position in refusing to Prussia what it had granted to Alsace-Lorraine offered an easy mark for the attacks of the Prussian reformers. The Socialists were quick to see this, and began anew their campaign for electoral reform in Prussia. The opposition in general condemned the constitution as injurious to the interests of the empire. The Conservatives in particular declared that the bestowal of three votes upon Alsace-Lorraine was a menace to the interests of Prussia and undermined her power as a dominant state of the empire. In their arguments they ignored the fact that Prussian influence was insured by the provision that the new governor for life should be appointed by the emperor, who is king of Prussia. In Alsace-Lorraine it was opposed by those who demanded complete autonomy and considered the present measure inadequate.

WORKMEN'S INSURANCE. In addition to effecting its main purpose as to Alsace-Lorraine, the government secured another success in the passage of the workmen's insurance consolidation and amendment bill. This highly complicated measure, comprising some 2000 articles, seemed likely to meet with obstruction. In order to carry it through in the brief summer session, beginning on May 2 and ending in July, it was necessary to limit discussion in certain respects, and it was feared that the evident design of the government to have the bill passed before the elections would arouse the opposition of the parties of the Left. The number of clauses and the complexity of the subject seemed likely to give the Socialists an excellent opportunity for obstruction. These fears, however, were not realized. The Socialists, although they were dissatisfied with many important provisions, raised no obstacle, and even endeavored to hasten the vote. There was some lively discussion during the session on certain special questions, such as employment of physicians' aid in maternity cases, etc. But the bill was passed eventually with comparatively slight changes in the text as drafted by the commission which had for a long time been at work upon it. It passed its final reading on May 30 by a vote of 232 to 58, the majority consisting of Socialists and Liberals. The chief purposes of the measure were to combine the various imperial insurance schemes in a single law, to extend sickness insurance to agricultural laborers, casual laborers, and home workers, and to make a beginning of insurance for widows and orphans. (See **WORKMEN'S INSURANCE**.) These two successes strengthened considerably the position of the government in the Reichstag.

THE BAGDAD RAILWAY. As a result of the Potsdam meeting between the czar and the kaiser in the autumn of 1910 a convention between Russia and Germany concerning railway projects in Persia was formed on

January 13 and signed on August 19. By this the Russian government engaged not to oppose the completion of the Bagdad Railway project or the participation of foreign capital in that enterprise. In order to meet the German need for a line that should link the Bagdad Railway with the Persian system the Russian government agreed to apply to Persia for railway concessions including one for a line from Teheran to Khanikin, the building of which must be begun within two years after the completion of the Sadjidje-Khanikin line and completed within four years. The German government engaged to seek no new concessions for railways, roads, waterways, or telegraphs in Persian territory north of a line running from Kasri-Shirin on the western frontier along the parallel of Gazik to the Afghan frontier, which line divides the British and Russian spheres of influence according to the Anglo-Russian agreement of 1907. Both governments agreed to grant facilities for international traffic on their respective lines. The German government admitted that it had no political interest in Persia and declared that it would pursue only commercial interests there, while it recognized on the part of Russia special interests of a strategic and economic nature. The Russian government declared it would continue to apply toward Germany the rule of perfect equality of treatment as to trade in Persia. In the construction of the line from Teheran to Khanikin, Russia, had the right to call in any foreign financial group. This agreement was regarded by the other powers, especially France and Turkey, with suspicion and alarm. For the attitude of France, see **FRANCE**, paragraphs on *History*. In Turkey, Germany was blamed for seeming to discountenance Turkish enterprise by her promise not to support any demands, whether of her own subjects or those of other powers, for concessions in the north. It was assumed that Germany referred to concessions in a region that belonged to Turkey and it was asked why she should try to prevent the Turks from building railways in the provinces of their own empire. On the publication of the first reports of the convention the Turkish press emphatically declared its disapproval. In Great Britain there was a disposition to demand that the Germans should recognize the special British interests on the Persian Gulf as well as the special Russian interests in the north, but there was no evidence of any unwillingness on the part of the British government to come to an understanding with Germany as to the Bagdad line, Sir Edward Grey declared on March 8 that Great Britain had no right to object to concessions to the Germans in Turkish territory, but would be concerned if asked to consent to providing further revenues to the Turkish government, "because we have a right to demand that before we agree to those increased burdens the Turkish government should make it clear that the revenue is going to be applied to the purposes to which we wish to see it applied—namely, the good government and strengthening of the Turkish Empire—and is not going to be used to construct railways which for strategical or other reasons the Turkish government may be very anxious to have, but which may incidentally prejudice the interests of British trade." Apropos of a possible extension of the line to Koweit, he added that if the Bagdad railway proceeded farther than Turkish territory England's diplomatic position would be

very different. It was learned in March that the Imperial Bagdad Railway Company had given up their right to build the section from Bagdad to the Persian Gulf and to build a port at Busra, provided it received a share in any new company that was formed for that purpose. Thereupon the Turkish government began negotiations with Great Britain for building the line from Bagdad to the gulf. These negotiations were going on during the year, the British government stipulating for economic equality on the railway and a definite arrangement as to the Persian Gulf region as conditions for granting the increase of customs duties required by Turkey for the cost of the enterprise. It was also reported on March 22 that the arrangements between the Turkish government and the Bagdad Railway Company comprised three agreements: First, relating to the financing of the line as far as Bagdad; second, comprising a concession for the branch from Osmanieh to Alexandretta, and third comprising a concession for the harbor of Alexandretta. Under the first agreement the company was to receive securities which would enable it to construct a line within five years after the plans were procured and it was to abandon its claim to the proceeds of the 4 per cent. customs increase. The second agreement was described as offering the shortest route from Aleppo to the Mediterranean. The third agreement empowered the Bagdad Railway Company to build a harbor at Alexandretta under the same terms as that at the port of Haidar Pasha, which is the starting point of the Anatolian Railway.

THE MOROCCAN AFFAIR. During the summer public opinion was much agitated over the government's course in sending a gunboat to the Agadir in Morocco and subsequently negotiating with France concerning compensation to Germany for allowing France a free hand in Morocco. The sending of the *Panther* to Agadir was at first received with enthusiasm, but as the reports of the negotiations with France leaked out there was much concern lest Germany was not getting a fair share in the bargain. The speech of Mr. Lloyd-George, the British chancellor, declaring that if the parties to the Moroccan negotiations could not come to satisfactory agreement, Great Britain must intervene, occasioned much adverse comment in Germany. As the negotiations continued, however, the anxiety on the subject abated for a time, but was revived in the autumn. It seemed that the great majority of the German people desired peace, but insisted that Germany's economic interests be safeguarded and that she be treated in the political world as an equal. In certain quarters it was held that the German government had gone into this foreign adventure with a view to creating a platform for the next election, that it sought to appeal to the Nationalist sentiment by a successful stroke in foreign policy, and it was argued that its comparative failure in internal affairs made this necessary. However, the government having won two remarkable parliamentary successes in the Reichstag this argument lost some of its force. Public indignation was raised to a high point after the assembling of the Reichstag in the autumn. Criticism of the government for its Moroccan policy reached a point of great bitterness in the speech of the leader and chief organizer of the Conservative party, Herr von Heydebrand at a mass-meeting of Silesian Con-

servatives toward the end of the year. He declared that all patriots felt bitterly the loss of German prestige when they saw that France and England had attained their object. It could not be denied that now that the last empire in Africa had passed to France, the latter's prestige had greatly increased. The sending of a vessel to Agadir, though hailed with joy at the time, had had the bitter result of giving occasion to an act of colossal insolence on the part of the English government towards Germany. The Liberal ministry, which was always counted as a less warlike ministry in England, could congratulate itself and declare that England alone ruled the world. Germany should have been spared such an affront as that. So far as the Conservative party was concerned, it had not left the government in doubt in the negotiations, but that it would stand by it if it were necessary to take firm measures. For details of the Moroccan affair and its effect on German politics at the close of the year, see *MOROCCO, History*.

PRUSSIA. The Prussian Diet opened on January 10, 1911. The chancellor did not refer to the Franchise measure, but dwelt on the need of economy in the appropriations. The financial estimates for 1911 were announced as showing a considerable excess over the previous year, and the discussion of the budget followed. The question was raised in the Diet in March in regard to the demand of the Vatican that Catholic priests engaged as professors in government institutions shall take the anti-modernist oath. The pope in a letter to Cardinal Fischer had accused those who objected to this requirement of hostility to the church, and had said that priest-professors should be made either to take the oath or to resign. Members of the upper house interpellated the government, inquiring whether certain professors in the Prussian universities who had taken the oath had been compelled to do so and whether this was consistent with the oath of office which they took on becoming professors. Some went so far as to demand the rupture of diplomatic relations with the Vatican. This the chancellor refused, but at the same time warned the Vatican that it was placing German forbearance under a strain. The chief measures before the Diet were the Cremation bill and the measures unifying the administration of Greater Berlin and for requiring the Prussian communes to maintain technical schools. In Prussia, owing to the opposition of the clerical element, it was not possible to cremate the dead, although in adjoining states it had been permitted for a long time. It was necessary, therefore, to send bodies for cremation outside the kingdom, and this requirement was especially objectionable to the working classes, who were the most in favor of cremation. The law was passed, but with certain amendments which made its application difficult. Among these was the requirement that the consent of two-thirds of the municipal council was necessary for any cremation in the community. As to the administration of Berlin, plans had been under discussion for many years for the establishment of a single consistent municipal system, but all efforts had been frustrated by the jealousies of the municipal authorities and by a distrust on the part of the Liberal Berlin administration of the Conservative government. The new measure unites in a federation the municipalities of Greater Berlin,

A Leader of the Social Democrats

TWO PROMINENT FIGURES IN GERMAN POLITICS IN 1911

that is to say, Berlin itself, and its environs within a certain radius. The federal administration is to perform certain functions concerning the common interests of all the municipalities. Representatives from the constituent parts of the greater city form a sort of parliament to decide upon common interests. As to the measure concerning the maintenance of technical schools it was designed merely to give a legal status to a condition that already existed in most of the towns. It required those towns which had not established such schools, to create them. The government, however, encountered the opposition of the reactionaries, who refused to vote for the measure unless it provided for a system of religious instruction, and as this was impracticable, the bill was not passed.

In 1910 riots resulting from labor troubles occurred in the Moabite district of Berlin, and many arrests were made. The affair became the subject of much discussion in the press. The police were blamed by the Socialists for extreme severity, and even outside Socialist circles the government was accused of making too much of the affair. There was great interest in the trial which took place in the latter part of 1910 and concluded on January 23, 1911. Out of thirty-four persons arrested three were acquitted and the rest were sentenced to terms of imprisonment varying from two days to three years. The court in the course of the trial passed a severe censure upon the police, who, it said, had gone too far in many cases. At the same time it excused these excesses on account of the difficulties of the situation which exposed them to great peril and frequent insult and provocation.

OTHER EVENTS. On January 17 the submarine, U3, sank in Kiel harbor, and three of the twenty-eight men on board lost their lives. These were the commanding officer, a lieutenant, and one seaman. Sentence for *lèse majesté* was rendered early in February against a Socialist, Hanke, for declaring in a public lecture that the statement attributed to the emperor in the famous London *Daily Telegraph* interview to the effect that a large number of the German people were hostile to England, was a conscious lie. He was sentenced at Duisburg to four weeks' imprisonment. On May 17 an arrangement was made with the United States concerning the price of potash, thus bringing to a close the difficulty over the potash syndicate, which had arisen in 1910. (See FERTILIZERS). The annual meeting of the German Navy League was held at Nuremberg on May 28. It assumed that the government was going to build in 1911 only two, instead of four, big ships, and the league demanded that one more large cruiser be built each year from 1912 on. This agitation on the subject was condemned in official quarters as likely to cause further international troubles. On June 10 the tenth dreadnought was launched. In Germany, as in other countries, there was much agitation over the increased cost of living, and Socialist deputies in the Reichstag expressed the general discontent. They demanded the suspension or reduction of import duties on food. In reply to an interpellation as to the price of food and measures of relief, the imperial chancellor defended the present fiscal system and denounced the agitation about prices. He denied that the protection of agriculture had injured industry or starved the people and held that the increased

cost of living was a mere incident of general industrial progress. Despite the increased prices the standard of living was higher than ever. The emperor and empress visited Vienna in March and later Venice and Corfu. They visited London on May 15 to attend the unveiling of Queen Victoria's statue. The crown prince made a tour of India, whence he returned in April. He visited St. Petersburg in May and London in June to attend the coronation. See **SOCIALISM**.

GEYSERS. See **GEOLOGY**.

GHEENT, W. J. See **LITERATURE, ENGLISH AND AMERICAN, Political and Social Science**.

GIBRALTAR. A British crown colony and naval station on the southern coast of Spain. Area, 17½ sq. miles; greatest elevation, 1439 feet; population, estimated 1909, 23,915 (civil, 18,351; actual military, 5564); civil, April, 1911, 19,120. There are private and government schools, with 2819 pupils in 1909-10; government grant, £2458. Total tonnage entered (1909), 4,896,174 (British, 3,048,086). There are four miles of internal telegraph besides external cable communications. Revenue and expenditure in 1909, £85,540 and £82,313 respectively; in 1910, £80,920 and £76,410. Governor and commander-in-chief, General Sir Archibald Hunter.

GIBSON, WILLIAM CAMPBELL. A rear-admiral of the United States navy, retired, died May 10, 1911. He was born in Albany, N. Y., in 1838, and was educated in the schools of that city. After serving for a short time as a clerk in the hardware business in Albany, he went to sea in the merchant service in 1855. In 1861 he enlisted in the United States navy and in the following year was appointed acting mate. He was promoted through various grades until he became captain in 1900, and rear-admiral in the same year, when he was retired. He served on the Potomac flotilla and the North and South Atlantic blockading squadrons during the Civil War. After the war he served on the European, North Atlantic, Pacific and South Atlantic stations. During the Spanish-American War he commanded the steamer *City of Peking*, which carried part of the first military expedition to Manila. His last duty was the command of the battleship *Texas* on the North Atlantic station.

GIFTS AND BEQUESTS. The following list of gifts and bequests is compiled from the annual records kept by the *Chicago Tribune*.

The total donations and bequests made during 1911 of which record has been kept amounted to \$126,499,918. This is \$15,104,620 less than the recorded gifts and bequests made in 1910. The sum distributed in 1911 is divided as follows: Charities, \$32,561,117; educational institutions, \$61,879,296; religious institutions, \$20,166,505; art museums, galleries, and municipal improvements, \$9,930,500; libraries, \$1,942,500.

The gifts made by Andrew Carnegie during the year ranked easily first. They amounted in all to \$40,441,300. This included \$25,000,000 to the Carnegie Foundation, and \$10,000,000 to the Carnegie Institution at Washington. Mr. Carnegie also gave large sums to form hero funds in several European countries. The gifts of John D. Rockefeller amounted during the year to \$1,020,000. Of this \$1,000,000 was given to the Rockefeller Institute of Medical

Research. There were several other gifts in excess of \$1,000,000. One of these was the gift of R. A. Barnes of \$3,000,000 to found a hospital in St. Louis. By the will of Joseph Pulitzer various educational institutions in New York City and elsewhere received \$4,325,000. An unusual gift was one of \$1,500,000 given by T. C. Du Pont of Wilmington, Del., for a State boulevard. Only the gifts of \$5000 or more are noted in the list which follows:

Abbot, Clare, Waltham, Mass., will to charity, \$7500.

Abraham, Abraham, New York, willed to Brooklyn Institute of Arts and Science, \$10,000; willed to charity, \$75,000.

Aero Club, gift by H. F. McCormick, \$28,000.

Agricultural Scholarships, gifts by J. Ogden Armour, Chicago, Ill., \$5000.

Alix le Daim Hospital, gift by J. Pierpont Morgan, \$50,000.

Aldis, Owen F., Chicago, Ill., gift to Yale University, \$100,000.

American Board of Commissioners for Foreign Missions, unnamed donor, \$1,000,000; gift by D. K. Pearsons, \$100,000.

American Geographical Society, will by D. O. Mills, \$25,000.

American Missionary societies, reported gifts in 1911, \$13,368,000.

American Missionary Board. Total contributions for 1911, \$1,085,000.

American Museum of Natural History, willed by D. O. Mills, \$100,000.

American Scenic and Historic Preservation Society, willed by William P. Letchworth, \$500,000.

American University, unnamed donor, \$200,000.

Amory, Edward L., Boston, Mass., will to Boston Athenæum, \$5000.

Amsterdam Hospital, gift by William Sloane, \$25,000.

Amherst College, gift by W. G. Fitch, \$20,000.

Andover, N. Y., gift for library by Andrew Carnegie, \$5000.

Anglo-African Entomological Society, gift by Andrew Carnegie, \$15,000.

Armour, J. Ogden, Chicago, Ill., gift for Agricultural scholarships, \$5000.

Armstrong, Florida, Cincinnati, O., will to charity, \$227,700; will to Mechanics' Institute, \$70,000; will to University of Cincinnati, \$30,000; will to Public Library, \$20,000; will to church, \$21,700.

Arnold, A. C., Battle Creek, Mich., will to W. C. T. U., \$10,000.

Arnold, O. H., Providence, R. I., willed to Brown University, \$85,000; willed to charity, \$15,000; willed to library, \$5000.

Astor, John J., New York, gift to Rhinebeck, N. Y., \$20,000.

Atlanta, Ga., gift to schools by W. S. Witham, \$5000.

Atlanta Theological Seminary, willed by Sarah R. Sage, \$8000.

Atlanta University, willed by Alice M. Curtis, \$5000.

Atkins, Mary, Kansas City, Mo., will to Art Museum, \$300,000.

Atterbury, W. W., New York, will to church, \$75,000.

Atwater, S. C., Springfield, Mass., will to charity, \$75,000.

Augustana College, library, unnamed donor, \$200,000; gift by various donors, \$151,922.

Avery, Emeline R., Alton, N. H., will to charity, \$14,446.

Ayer, Edward E., Chicago, Ill., gift of historical documents to Newberry library, \$400,000.

Babcock, Mrs. G. L., Plainfield, N. J., willed to charity, \$10,000.

Bailey, C. M., Winthrop, Me., gift to Northfield Seminary, \$25,000.

Bangor, Me., fire relief fund gift, various donors, \$50,000.

Baptist Church, Chicago, Ill., extension fund, gift by various donors, \$50,000.

Barnard, Lydia A., Milton, Mass., willed to Boston Museum of Fine Arts, \$50,000; willed to charity, \$40,000; willed to Harriman Institute, \$150,000; willed to Harvard University, \$171,000; willed to Radcliffe College, \$115,000; willed to Tuskegee Institute, \$25,000.

Barnard College, willed by Joseph Pulitzer, \$1,000,000.

Barnes, Cora L., New York, will to School of Design, \$10,000.

Barnes, R. A., St. Louis, Mo., will to hospital, \$3,000,000.

Barton, Elizabeth S. M., Philadelphia, Pa., willed to charity, \$25,000.

Bates, Octavia W., Baltimore, Md., willed to University of Michigan, \$25,000.

Belgian Hero Fund, gift by Andrew Carnegie, \$100,000.

Bennett, Mary F., Philadelphia, Pa., willed to charity, \$28,000.

Berea College, gift by D. K. Pearsons, \$100,000.

Bergstadt, Mrs. Agnes, gift to Swarthmore College, \$25,000.

Bethany College, gift by E. W. Ogleby, and M. M. Cochrane, \$150,000; gift by R. A. Long, Kansas City, Mo., \$25,000.

Blocher, John, Buffalo, N. Y., willed to Blocher Home, \$135,000.

Blocher, William, Buffalo, N. Y., willed to Blocher Home, \$150,000.

Blocher Home, Buffalo, N. Y., willed by John Blocher, \$135,000; willed by William Blocher, \$160,000.

Bonsall, William, Philadelphia, Pa., will to hospital, \$80,000.

Bosse, Louise, Philadelphia, Pa., willed to charity, \$10,700.

Boston Art Club, willed by Moses W. Richardson, \$5000.

Boston Athenæum, gift by Edward L. Amory, \$5000.

Boston Medical Library, willed by Dr. O. F. Wadsworth, \$12,000.

Boston Museum of Fine Arts, willed by Nathaniel Thayer, \$250,000; willed by Lydia A. Barnard, \$50,000.

Boudmit, Elizabeth C. H., Philadelphia, Pa., will to church, \$35,000.

Bowen, Mrs. J. T., Chicago, Ill., will to Hull House, \$20,000.

Bowen, W. P., Muncie, Ind., gift to Transylvania College, \$15,000.

Bowdoin College, willed by Mary E. W. Perry, \$10,000; various donors, \$86,000.

Bowman, Maria E., New Orleans, La., willed to charity, \$30,000.

Bowne, Mrs. S. W., New York, gift to Poughkeepsie Hospital, \$50,000.

Boyd, William C., Chicago, Ill., gift to Harvard University, \$100,000.

Boyle, Catherine, Philadelphia, Pa., willed to church, \$30,000.

Brantford, Ont., gift to Industrial League, by John D. Rockefeller, \$10,000.

Breckenridge, Mary E., New York, willed to poor of Switzerland, \$10,600.

Brewster, Edwin L., Chicago, Ill., gift to Art Institute, \$5000; gift to charity, \$10,000.

Brookline, Mass., willed to church by Edith Child, \$8000; willed to charities by Sarah O. Matchett, \$250,000.

Brooklyn College, various donors, \$163,800.

Brooklyn Institute of Arts and Sciences, willed by Abraham Abraham, \$10,000.

Brooklyn Polytechnic Institute, willed by Walter E. Duryea, \$15,000.

Burne, Mrs. Archer, Orange, N. J., gift to Drew Theological Seminary, \$10,000.

Brown University, willed by O. H. Arnold, \$85,000.

Brown, W. V., Portland, Me., will to Y. M. C. A., \$40,000.

Bryan, Madge H., Philadelphia, Pa., willed to charity, \$6000.

Bryant, John D., Boston, Mass., will to Harvard Dental School, \$10,000; will to charities, \$70,000; willed to churches, \$10,000; willed to Fairmont College, \$5000.

Bryn Mawr College, will by J. C. Strawbridge, \$10,000; willed by Phoebe A. Thorne, \$150,000; willed by Emma C. Woerschaffer, \$750,000.

Buffalo General Hospital, gift by G. A. Plympton, Buffalo, \$5000.

Busch, Adolphus, St. Louis, Mo., gift to Harvard University, \$100,000.

Butler, Edward, Chicago, Ill., gift to Art Institute, \$150,000.

Butler, Mrs. H. B., Chicago, Ill., gift to settlement, \$70,000.

California School of Mechanical Arts, willed by Miranda Lux, \$1,000,000.

Campbell, James, Revere, Mass., will to charity, \$5000.

Canal Dover, O., gift to library by Andrew Carnegie, \$9000.

Canfield, R. A., gift to Saratoga National Park Commission, \$5000.

Carnegie, Andrew, gift to Anglo-African Entomological Society, \$15,000; gift for advancement of education, \$25,000,000; gift to Belgian Hero Fund, \$100,000; gift to library, Canal Dover, O., \$9000; gift to Carnegie Foundation, \$1,000,000; gift to Carnegie Institution at Washington, \$10,000,000; gift to Cornell University, \$60,300; gift to Denmark Hero Fund, \$100,000; gift to charities of Dunfermline, Scotland, \$1,250,000; gift to German Hero Fund, \$1,500,000; gift to Eaton (Pa.) library, \$7500; gift to library, Elizabeth, N. J., \$50,000; gift to library, Franklin, Tenn., \$10,000; gift to library to Fulton, Mo., \$12,000; gift to Holland Hero Fund, \$250,000; gift to library for colored people, Houston, Tex., \$15,000; gifts to Iowa libraries, \$154,000; gift to Illinois College \$75,000; gift of library to Los Angeles, Cal., \$210,000; gift to Mary Mitchell Association of Vassar College, \$10,000; gift of library to Middlesboro, Ky., \$15,000; gift of library to Milan, O., \$8000; gift to public library, New York, \$375,000; gift to Norwegian Hero Fund, \$120,000; additional gift to Pan-American building, \$100,000; gift to Pan American Union, \$25,000; gift of library to Sherman, Tex., \$50,000; gift to Sweden Hero Fund, \$250,000; gift to Thompsonville, Conn., library, \$7500; gift to Topeka Industrial Institute \$10,000; gift of library to Crooksville, O., \$20,000; gift of library to Sebastopol, Cal., \$7500; gift for library, Andover, N. Y., \$5000; Carnegie Foundation, gift by Andrew Carnegie, \$1,000,000.

Carnegie Institution at Washington, gift by Andrew Carnegie, \$10,000,000.

Central College, willed by Martha Monroe, \$8000.

Chadwick, Susan, Peabody, Mass., will to charity, \$7000.

Champaign, Ill., gift to church by W. B. McKinley, \$30,000.

Charles, W. H., Philadelphia, Pa., will to Law and Order Society, \$40,000.

Chicago, Ill., gift to Art Institute by Edward Brewer, \$5000.

Chicago, Ill., Colored Y. M. C. A., gift by U. W. Harris, \$25,000; gift by Cyrus H. McCormick, \$25,000; gift by Julius Rosenwald, \$25,000; gift by various donors, \$66,000.

Child, Edith, Brookline, Mass., will to charity, \$7000; will to church, \$8000.

Children's Home, gift by W. G. McCullough, \$100,000.

Chinese Famine Fund, gift by various donors, \$82,000; gift by various donors of New York, \$31,000.

Choate, Charles F., Southboro, Mass., willed to hospital, \$5000.

Christian Missionary Alliance, New York, various donors, \$50,000.

Christian University, Canton, Mo., unnamed donor, \$25,000.

Cincinnati, University of, will by Floris Armstrong, \$30,000.

Cincinnati, O., public library, willed by Floris Armstrong, \$20,000.

Cincinnati, O., willed to Musical Association by Mary Dexter, \$12,000.

City Missionary Society, gift by D. K. Pearsons, Chicago, Ill., \$50,000.

Clark, W. A., Washington, D. C., gift to Corcoran Gallery, \$5000.

Cleveland, O., Park, unnamed donor, \$500,000.

Cochran, A. S., New York, gift to Mount Vernon Hospital, \$16,000.

Cochran, J. H., Williamsport, Pa., will to charity, \$25,000.

Columbia University, willed by Joseph Pulitzer, \$2,250,000; gift by various donors, \$200,000; willed by Lizzie D. Lockwood, \$5000.

Connecticut Valley Historical Society, gift by estate of S. B. Wesson, \$1,000,000.

Cooke, Mary H., Cambridge, Mass., willed to college, \$16,000.

Cooper, E. B., Hampden, Conn., willed to Humane Society, \$60,000.

Corcoran Gallery, gift by W. A. Clark, \$5000.

Cornell University, gift by Andrew Carnegie, \$60,300; gift by Mrs. Russell Sage, \$800,000; various donors, \$30,000.

Coyser, Ellsworth B., New Haven, Conn., willed to Humane Society, \$50,000.

Crane, Charles R., Chicago, Ill., gift to charity, \$100,000; gift to Vermont Academy, \$5000.

Crimmins, Thomas D., New York, will to charities, \$8250.

Crooksville, O., gift of library by Andrew Carnegie, \$20,000.

Crozer, J. P., Chester, Pa., gift to Y. M. C. A., \$10,000.

Curley, John, New York, will to charities, \$180,000.

Curtis, Alice M., Wellesley, Mass., willed to Atlanta University, \$5000; willed to Hampton Institute, \$5000; willed to other educational institutes, \$110,000; willed to Radcliffe College, \$25,000; willed to Tuskegee Institute, \$5000.

Curtis, Mrs. F. T., estate of, gift to Williams College, \$35,000.

Curtis, Gen. H. K., gift of organ to Auditorium, Portland, Me., \$30,000.

Dangler, Antoinette C., Lake Forest, Ill., will to charity, \$11,000.

Dartmouth College, willed by Elijah M. Topliff, \$200,000.

Davis, Henry G., Elkins, W. Va., gift to Davis and Elkins College, \$100,000; gift of church to town, \$20,000.

Davis, Nathan J., Somerville, Mass., will to library, \$10,000.

Davis and Elkins College, gift by Henry G. Davis, \$100,000.

Daughters of American Revolution, will by Hugh V. Washington, \$75,000.

Delaware, gift of boulevard to State by T. C. DuPont, \$1,500,000.

Denmark Hero Fund, gift by Andrew Carnegie, \$100,000.

Denton, Mrs. C. B., Rutland, Vt., willed to hospital, \$50,000.

Dexter, Mary, Cincinnati, O., willed to charity, \$8000; willed to musical associations, \$12,000.

Dewey, Marie W., Northampton, Mass., will to charity, \$7000.

Diversey, Catherine A., Philadelphia, Pa., will to charity, \$12,000.

Dixon, Ill., Dixon Hospital, willed by Elizabeth Shaw, \$30,000.

Doane College, gift by D. K. Pearsons, Chicago, Ill., \$250,000.

Dodge, Mary C., New York, willed to charity, \$80,000.

Dorchester, Mass., willed to church by Alice C. Linscott, \$15,000.

Dortic, Adela A., New York, willed to church, \$15,000; willed to charities, \$119,500.

Douglas Hospital, Philadelphia, Pa., various donors, \$15,000.

Doyle, Annie E., New York, willed to church, \$15,000.

Doyle, John F., New York, will to church, \$20,000.

Drew Theological Seminary, gift by Mrs. Archer Browne, \$10,000; gift by Mrs. Stephen Greene, \$5000.

Dudley, Cornelia H., Galesbury, Ill., will to Knox College, \$20,000.

Duke, J. B., Durham, N. C., gift to Trinity College, \$50,000.

Dunfermline, Scotland, gift to charities by Andrew Carnegie, \$1,250,000.

Dunwoody, W. H., Minneapolis, Minn., gifts to Art Museum, \$400,000.

DuPont, T. C., gift of land to Institute of Technology, Boston, Mass., \$500,000.

DuPont, T. C., Wilmington, Del., gift of boulevard to State, \$1,500,000.

Durand, Calvin, Chicago, Ill., will to charity, \$8000; will to Lake Forest University, \$5000.

Duryea, Walter E., New York, willed to Brooklyn Polytechnic Institute, \$15,000; willed to charity, \$119,000.

Dysart, James, Hollidaysburg, Pa., gift to Y. M. C. A., \$15,000.

Eaton (Pa.) library, gift by Andrew Carnegie, \$7500.

Eaton, Georgiana C., Boston, Mass., will to church, \$10,000.

Eberhart, J. F., Chicago, Ill., gift to Wheaton College, \$5000.

Educational institutes, willed by Alice M. Curtis, \$110,000.

Elgin Academy, gift by Nathaniel C. Sears, \$10,000.

Elizabeth, N. J., gift to library by Andrew Carnegie, \$50,000.

Elkins, G. W., and sister, Philadelphia, Pa., gift to Y. M. C. A., \$880,000.

Ely, Smith, New York, willed to charity and churches, \$1,000,000.

Emery, Mrs. T. J., Cincinnati, O., gift to Y. M. C. A., \$225,000.

- Emporia, College of, various donors, \$100,000.
 Evans, Sarah, Marysville, O., willed to church, \$25,000.
 Everts, Jeannette, Santa Cruz, Cal., willed to charity, \$70,000.
 Fairmont College, willed by John D. Bryant, \$5,000.
 Faris, Thomas N., Bloomington, Ind., gift to church, \$11,000.
 Farwell, Mrs. F. C., Lake Forest, Ill., gift to Yale University, \$25,000.
 Fassett, Sallie S., Philadelphia, Pa., will to charity, \$8,000.
 Ferguson, Mary A., New York, willed to charity, \$5,000.
 Fish University, various donors, \$122,000.
 Fisher, Charles B., Springfield, O., willed to charity, \$20,000.
 Fisher, Susan, Norristown, Pa., willed to charity, \$15,000; willed to church, \$15,000.
 Flak University, gift by Julius Rosenwald, Chicago, Ill., \$12,500; various donors, \$114,000.
 Fitch, W. G., Hartford, Conn., gift to Amherst College, \$20,000.
 Fogel, Alexander, Philadelphia, Pa., will to charities, \$21,100.
 Fox, George L., New York, willed to charity, \$500,000.
